`generate_relative(+compound,++compound)` - `one_or_error`

Exceptions:

`Sink` is a variable:

`instantiation_error`

`RelativePointer` is not a valid Relative JSON Pointer term:

`domain_error(json_relative_pointer,RelativePointer)`

`RelativePointer` contains an invalid reference token:

`domain_error(json_pointer_token,Token)`

`Sink` cannot be generated:

`domain_error(json_relative_pointer_sink,Sink)`

---

evaluate/3

Evaluates a parsed JSON Pointer against a JSON term. Fails if the pointer does not identify a value in the given JSON term.

Compilation flags:
`static`

Template:
`evaluate(Pointer,JSON,Value)`
Mode and number of proofs:
`evaluate(++list(ground),++term,?term)` - `zero_or_one_or_error`

Exceptions:
`Pointer` is a variable:
`instantiation_error`
`JSON` is a variable:
`instantiation_error`
`Pointer` is neither a variable nor a list:
`type_error(list,Pointer)`
`Pointer` contains an invalid reference token:
`domain_error(json_pointer_token,Token)`

---

evaluate_relative/4

Evaluates a parsed Relative JSON Pointer term against a JSON term, using the second argument as the absolute JSON Pointer to the current context value. Fails if either the context or the relative pointer does not identify a value in the given JSON term.

Compilation flags:
`static`

Template:
`evaluate_relative(RelativePointer,Context,JSON,Value)`
Mode and number of proofs:
`evaluate_relative(++compound,++list(ground),++term,?term)` - `zero_or_one_or_error`

Exceptions:
`RelativePointer` is a variable:
`instantiation_error`
`Context` is a variable:
`instantiation_error`
`JSON` is a variable:
`instantiation_error`
`RelativePointer` is not a valid Relative JSON Pointer term:
`domain_error(json_relative_pointer,RelativePointer)`
`Context` is neither a variable nor a list:
`type_error(list,Context)`
`Context` or `RelativePointer` contains an invalid reference token:

```
domain_error(json_pointer_token,Token)
```

Protected predicates

Private predicates

(none)

Operators

(none)

1.172 json_rpc

object

1.172.1 `json_rpc`

JSON-RPC 2.0 protocol encoding and decoding. Provides predicates for constructing and parsing JSON-RPC 2.0 request, notification, response, and error objects. Uses the `json` library for JSON parsing and generation.

Availability:
`logtalk_load(json_rpc(loader))`

Author: Paulo Moura
Version: 1:0:4
Date: 2026-07-13

Compilation flags:
`static, context_switching_calls`

Uses:
json
list
reader

Remarks:

- Specification: Implements the JSON-RPC 2.0 specification (https://www.jsonrpc.org/specification).
- JSON representation: Uses the `json` library default representation: curly terms for objects, dashes for pairs, and atoms for strings.
- Request: A JSON-RPC 2.0 request is represented as `{jsonrpc-'2.0', method-Method, params-Params, id-Id}`.
- Notification: A JSON-RPC 2.0 notification is represented as `{jsonrpc-'2.0', method-Method, params-Params}`.
- Successful response: A JSON-RPC 2.0 successful response is represented as `{jsonrpc-'2.0', result-Result, id-Id}`.

- Error response: A JSON-RPC 2.0 error response is represented as `{jsonrpc-'2.0', error-{code-Code, message-Message}, id-Id}` or `{jsonrpc-'2.0', error-{code-Code, message-Message, data-Data}, id-Id}`.
- Batch request: A JSON-RPC 2.0 batch request is represented as a list of request and/or notification terms.
- Error codes: Standard error codes: -32700 (parse error), -32600 (invalid request), -32601 (method not found), -32602 (invalid params), -32603 (internal error). Server errors: -32000 to -32099.

Public predicates

request/4

Constructs a JSON-RPC 2.0 request term.

Compilation flags:
```
static
```

Template:
```
request(Method,Params,Id,Request)
```
Mode and number of proofs:
```
request(+atom,+list,+nonvar,--compound) - one
```

---

request/3

Constructs a JSON-RPC 2.0 request term with no parameters.

Compilation flags:
```
static
```

Template:
```
request(Method,Id,Request)
```
Mode and number of proofs:
```
request(+atom,+nonvar,--compound) - one
```

---

notification/3

Constructs a JSON-RPC 2.0 notification term (a request without an id).

Compilation flags:
```
static
```

Template:
```
notification(Method,Params,Notification)
```
Mode and number of proofs:
```
notification(+atom,+list,--compound) - one
```

---

notification/2

Constructs a JSON-RPC 2.0 notification term with no parameters.

Compilation flags:
```
static
```

Template:
```
notification(Method,Notification)
```
Mode and number of proofs:
```
notification(+atom,--compound) - one
```

---

response/3

Constructs a JSON-RPC 2.0 successful response term.

Compilation flags:
```
static
```

Template:
```
response(Result,Id,Response)
```
Mode and number of proofs:
```
response(+nonvar,+nonvar,--compound) - one
```

---

error_response/4

Constructs a JSON-RPC 2.0 error response term with a null id (used when the request id cannot be determined).

Compilation flags:
```
static
```

Template:
```
error_response(Code,Message,Id,ErrorResponse)
```
Mode and number of proofs:
```
error_response(+integer,+atom,+nonvar,--compound) - one
```

---

error_response/5

Constructs a JSON-RPC 2.0 error response term with additional error data.

Compilation flags:

```
static
```

Template:

```
error_response(Code,Message,Data,Id,ErrorResponse)
```

Mode and number of proofs:

```
error_response(+integer,+atom,+nonvar,+nonvar,--compound) - one
```

---

parse_error/1

Constructs a JSON-RPC 2.0 parse error response (-32700) with a null id.

Compilation flags:

```
static
```

Template:

```
parse_error(ErrorResponse)
```

Mode and number of proofs:

```
parse_error(--compound) - one
```

---

invalid_request/1

Constructs a JSON-RPC 2.0 invalid request error response (-32600) with a null id.

Compilation flags:

```
static
```

Template:

```
invalid_request(ErrorResponse)
```

Mode and number of proofs:

```
invalid_request(--compound) - one
```

---

method_not_found/2

Constructs a JSON-RPC 2.0 method not found error response (-32601).

Compilation flags:
```
static
```

Template:
```
method_not_found(Id,ErrorResponse)
```
Mode and number of proofs:
```
method_not_found(+nonvar,--compound) - one
```

---

invalid_params/2

Constructs a JSON-RPC 2.0 invalid params error response (-32602).

Compilation flags:
```
static
```

Template:
```
invalid_params(Id,ErrorResponse)
```
Mode and number of proofs:
```
invalid_params(+nonvar,--compound) - one
```

---

internal_error/2

Constructs a JSON-RPC 2.0 internal error response (-32603).

Compilation flags:
```
static
```

Template:
```
internal_error(Id,ErrorResponse)
```
Mode and number of proofs:
```
internal_error(+nonvar,--compound) - one
```

---

encode/2

Encodes a JSON-RPC 2.0 term (request, notification, response, error, or batch) into a JSON atom.

Compilation flags:
`static`

Template:
`encode(Term,JSON)`
Mode and number of proofs:
`encode(+compound,--atom)` - `one`

---

decode/2

Decodes a JSON atom into a JSON-RPC 2.0 term (request, notification, response, error, or batch).

Compilation flags:
`static`

Template:
`decode(JSON,Term)`
Mode and number of proofs:
`decode(+atom,--compound)` - `one_or_error`

Exceptions:
`JSON` is a variable:
`instantiation_error`
`JSON` is neither a variable nor a valid JSON atom term or does not contain parsable JSON by the implementation:
`domain_error(json_source,JSON)`

---

is_request/1

True if the term is a valid JSON-RPC 2.0 request (has jsonrpc, method, and id fields).

Compilation flags:
`static`

Template:
`is_request(Term)`
Mode and number of proofs:
`is_request(+compound)` - `zero_or_one`

---

is_notification/1

True if the term is a valid JSON-RPC 2.0 notification (has jsonrpc and method fields but no id field).

Compilation flags:
`static`

Template:
`is_notification(Term)`
Mode and number of proofs:
`is_notification(+compound)` - `zero_or_one`

---

is_response/1

True if the term is a valid JSON-RPC 2.0 successful response (has jsonrpc, result, and id fields).

Compilation flags:
`static`

Template:
`is_response(Term)`
Mode and number of proofs:
`is_response(+compound)` - `zero_or_one`

---

is_error_response/1

True if the term is a valid JSON-RPC 2.0 error response (has jsonrpc, error, and id fields).

Compilation flags:
`static`

Template:
`is_error_response(Term)`
Mode and number of proofs:
`is_error_response(+compound)` - `zero_or_one`

---

is_batch/1

True if the term is a valid JSON-RPC 2.0 batch (a non-empty list).

Compilation flags:
```
static
```

Template:
```
is_batch(Term)
```
Mode and number of proofs:
```
is_batch(+compound) - zero_or_one
```

---

id/2

Extracts the id field from a JSON-RPC 2.0 message.

Compilation flags:
```
static
```

Template:
```
id(Message,Id)
```
Mode and number of proofs:
```
id(+compound,--nonvar) - zero_or_one
```

---

method/2

Extracts the method field from a JSON-RPC 2.0 request or notification.

Compilation flags:
```
static
```

Template:
```
method(Message,Method)
```
Mode and number of proofs:
```
method(+compound,--atom) - zero_or_one
```

---

params/2

Extracts the params field from a JSON-RPC 2.0 request or notification.

Compilation flags:
`static`

Template:
`params(Message,Params)`
Mode and number of proofs:
`params(+compound,--nonvar)` - `zero_or_one`

---

result/2

Extracts the result field from a JSON-RPC 2.0 response.

Compilation flags:
`static`

Template:
`result(Message,Result)`
Mode and number of proofs:
`result(+compound,--nonvar)` - `zero_or_one`

---

error/2

Extracts the error field from a JSON-RPC 2.0 error response.

Compilation flags:
`static`

Template:
`error(Message,Error)`
Mode and number of proofs:
`error(+compound,--compound)` - `zero_or_one`

---

error_code/2

Extracts the error code from a JSON-RPC 2.0 error response.

Compilation flags:

```
static
```

Template:

```
error_code(Message,Code)
```

Mode and number of proofs:

```
error_code(+compound,--integer) - zero_or_one
```

---

error_message/2

Extracts the error message from a JSON-RPC 2.0 error response.

Compilation flags:

```
static
```

Template:

```
error_message(Message,ErrorMessage)
```

Mode and number of proofs:

```
error_message(+compound,--atom) - zero_or_one
```

---

error_data/2

Extracts the error data from a JSON-RPC 2.0 error response. Fails if no data field is present.

Compilation flags:

```
static
```

Template:

```
error_data(Message,Data)
```

Mode and number of proofs:

```
error_data(+compound,--nonvar) - zero_or_one
```

---

write_message/2

Writes a JSON-RPC 2.0 message to an output text stream as a single line of JSON followed by a newline. Flushes the output stream after writing.

Compilation flags:
`static`

Template:
`write_message(Output,Message)`
Mode and number of proofs:
`write_message(+stream,+compound)` - `one`

---

read_message/2

Reads a JSON-RPC 2.0 message from an input text stream. Reads a line of JSON text and parses it. Fails at end of stream.

Compilation flags:
`static`

Template:
`read_message(Input,Message)`
Mode and number of proofs:
`read_message(+stream,--compound)` - `zero_or_one`

---

write_framed_message/2

Writes a JSON-RPC 2.0 message to an output stream using Content-Length framing (as used by LSP style protocols). The message is preceded by a `Content-Length:  N\r\n\r\n` header where `N` is the byte length of the JSON body. Flushes the output stream after writing.

Compilation flags:
`static`

Template:
`write_framed_message(Output,Message)`
Mode and number of proofs:
`write_framed_message(+stream,+compound)` - `one`

---

read_framed_message/2

Reads a JSON-RPC 2.0 message from an input stream using Content-Length framing (as used by LSP style protocols). Reads a `Content-Length: N\r\n\r\n` header followed by exactly `N` bytes of JSON body. Fails at end of stream or if the header is missing or malformed.

Compilation flags:
`static`

Template:
`read_framed_message(Input,Message)`
Mode and number of proofs:
`read_framed_message(+stream,--compound)` - `zero_or_one`

Public predicates

parse/2

Parses a JSON schema from the given source (`file(Path)`, `stream(Stream)`, `codes(List)`, `chars(List)`, or `atom(Atom)`) into a schema term.

Compilation flags:
`static`

Template:
`parse(Source,Schema)`

Mode and number of proofs:
`parse(++compound,--term)` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid JSON source term or does not contain parsable JSON:
`domain_error(json_source,Source)`
The parsed JSON value is not a valid JSON Schema term:
`domain_error(json_schema,Schema)`

validate/2

Validates a JSON term against a parsed schema. Succeeds if the JSON term is valid according to the schema.

Compilation flags:
`static`

Template:
`validate(Schema,JSON)`
Mode and number of proofs:
`validate(+term,+term)` - `zero_or_one`

---

validate/3

Validates a JSON term against a parsed schema. Returns a list of validation errors (empty list if valid).

Compilation flags:
`static`

Template:
`validate(Schema,JSON,Errors)`
Mode and number of proofs:
`validate(+term,+term,--list)` - `one`

Public predicates

decode/3

Decodes a compact JWT into header and claims JSON terms without verifying the signature.

Compilation flags:
`static`

Template:
`decode(Token,Header,Claims)`
Mode and number of proofs:
`decode(+atom,-term,-term)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

decode/5

Decodes a compact JWT into header, claims, signature bytes, and signing input.

Compilation flags:
`static`

Template:
`decode(Token,Header,Claims,Signature,SigningInput)`
Mode and number of proofs:
`decode(+atom,-term,-term,-list(byte),-atom)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

header/2

Decodes only the JWT header JSON term.

Compilation flags:
`static`

Template:
`header(Token,Header)`
Mode and number of proofs:
`header(+atom,-term)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

claims/2

Decodes only the JWT claims JSON term.

Compilation flags:
`static`

Template:
`claims(Token,Claims)`
Mode and number of proofs:
`claims(+atom,-term)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

claim/3

Looks up a claim value by name in a claims JSON term.

Compilation flags:
`static`

Template:
`claim(Claims,Name,Value)`
Mode and number of proofs:
`claim(+term,+atom,-term)` - `zero_or_one`

---

peek_algorithm/2

Decodes the JWT header and returns its algorithm.

Compilation flags:
`static`

Template:
`peek_algorithm(Token,Algorithm)`
Mode and number of proofs:
`peek_algorithm(+atom,-atom)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`
The decoded JWT header does not contain a valid `alg` member:
`domain_error(jwt_header,Header)`

---

peek_key_id/2

Decodes the JWT header and returns its optional key identifier.

Compilation flags:
`static`

Template:
`peek_key_id(Token,KeyId)`

Mode and number of proofs:

`peek_key_id(+atom,-atom)` - `zero_or_one`

`verify/4`

Verifies a compact JWT using a key or JWK Set and returns the claims.

Compilation flags:

`static`

Template:

`verify(Token,KeyOrJWKSet,Claims,Options)`

Mode and number of proofs:

`verify(+atom,+term,-term,+list(compound))` - `zero_or_one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Token` is a variable:

`instantiation_error`

`Token` is neither a variable nor an atom:

`type_error(atom,Token)`

`Token` is an atom but not a valid compact JWT:

`domain_error(jwt_compact_serialization,Token)`

`Token` contains Base64URL data with characters outside the Base64URL alphabet:

`representation_error(base64)`

The decoded JWT header does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(jwt_algorithm,Algorithm)`

`KeyOrJWKSet` is not a JSON Web Key Set with a `keys` list:

`domain_error(jwt_jwks,KeyOrJWKSet)`

No compatible key exists for the JWT header:

`existence_error(jwt_jwk,Header)`

`KeyOrJWKSet` is not a valid symmetric key:

`domain_error(jwt_symmetric_key,KeyOrJWKSet)`

`KeyOrJWKSet` is not a supported public JWK:

`domain_error(jwt_jwk_public_key,KeyOrJWKSet)`

The ES256 signature is not 64 bytes long:

`domain_error(jwt_es256_signature,Signature)`

The OpenSSL executable does not exist:

`existence_error(os_command,Executable)`

A required claim is missing:

`domain_error(jwt_claims,missing(Name))`

A claim has an invalid value:

`domain_error(jwt_claim(Name),Value)`

A time claim value is not a number:

`type_error(time_number,Name-Time)`

---

verify/5

Verifies a compact JWT using a key or JWK Set and returns the header and claims.

Compilation flags:

`static`

Template:

`verify(Token,Header,Claims,KeyOrJWKSet,Options)`

Mode and number of proofs:

`verify(+atom,-term,-term,+term,+list(compound))` - `zero_or_one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Token` is a variable:

`instantiation_error`

`Token` is neither a variable nor an atom:

`type_error(atom,Token)`

`Token` is an atom but not a valid compact JWT:

`domain_error(jwt_compact_serialization,Token)`

`Token` contains Base64URL data with characters outside the Base64URL alphabet:

`representation_error(base64)`

The decoded JWT header does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(jwt_algorithm,Algorithm)`

`KeyOrJWKSet` is not a JSON Web Key Set with a `keys` list:

`domain_error(jwt_jwks,KeyOrJWKSet)`

No compatible key exists for the JWT header:

`existence_error(jwt_jwk,Header)`

`KeyOrJWKSet` is not a valid symmetric key:

`domain_error(jwt_symmetric_key,KeyOrJWKSet)`

`KeyOrJWKSet` is not a supported public JWK:
```
domain_error(jwt_jwk_public_key,KeyOrJWKSet)
```
The ES256 signature is not 64 bytes long:
```
domain_error(jwt_es256_signature,Signature)
```
The OpenSSL executable does not exist:
```
existence_error(os_command,Executable)
```
A required claim is missing:
```
domain_error(jwt_claims,missing(Name))
```
A claim has an invalid value:
```
domain_error(jwt_claim(Name),Value)
```
A time claim value is not a number:
```
type_error(time_number,Name-Time)
```

---

verify_signature/5

Verifies a JWS signature for a signing input, algorithm, key, and options.

Compilation flags:
```
static
```

Template:
```
verify_signature(Algorithm,SigningInput,Signature,Key,Options)
```
Mode and number of proofs:
```
verify_signature(+atom,+atom,+list(byte),+term,+list(compound)) -
zero_or_one_or_error
```

Exceptions:

`Options` is a variable or a partial list:
```
instantiation_error
```
`Options` is neither a variable nor a list:
```
type_error(list,Options)
```
An element `Option` of the list `Options` is neither a variable nor a compound term:
```
type_error(compound,Option)
```
An element `Option` of the list `Options` is a compound term but not a valid option:
```
domain_error(option,Option)
```
`Algorithm` is unsupported or disallowed:
```
domain_error(jwt_algorithm,Algorithm)
```
`Key` is not a valid symmetric key:
```
domain_error(jwt_symmetric_key,Key)
```
`Key` is not a supported public JWK:
```
domain_error(jwt_jwk_public_key,Key)
```
`Signature` is not a 64-byte raw ES256 signature:
```
domain_error(jwt_es256_signature,Signature)
```
The OpenSSL executable does not exist:
```
existence_error(os_command,Executable)
```

---

sign/5

Signs claims as a compact JWT using the given header, key, and options.

Compilation flags:
`static`

Template:
`sign(Header,Claims,Key,Token,Options)`
Mode and number of proofs:
`sign(+term,+term,+term,-atom,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Header` does not contain a valid `alg` member:
`domain_error(jwt_header,Header)`
The JWT algorithm is unsupported or disallowed:
`domain_error(jwt_algorithm,Algorithm)`
`Header` or `Claims` cannot be encoded as JSON:
`domain_error(json_sink,HeaderOrClaims)`
`Key` is not a valid symmetric key:
`domain_error(jwt_symmetric_key,Key)`
`Algorithm` is not a supported signing algorithm:
`domain_error(jwt_signing_algorithm,Algorithm)`

---

sign_payload/5

Signs a payload JSON term as a compact JWS using the given header, key, and options.

Compilation flags:
`static`

Template:
`sign_payload(Header,Payload,Key,Token,Options)`
Mode and number of proofs:
`sign_payload(+term,+term,+term,-atom,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`

`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Header` does not contain a valid `alg` member:
`domain_error(jwt_header,Header)`
The JWT algorithm is unsupported or disallowed:
`domain_error(jwt_algorithm,Algorithm)`
`Header` or `Payload` cannot be encoded as JSON:
`domain_error(json_sink,HeaderOrPayload)`
`Key` is not a valid symmetric key:
`domain_error(jwt_symmetric_key,Key)`
`Algorithm` is not a supported signing algorithm:
`domain_error(jwt_signing_algorithm,Algorithm)`

---

validate_claims/3

Validates JWT claims using registered-claim defaults, a policy list, and options.

Compilation flags:
`static`

Template:
`validate_claims(Claims,Policy,Options)`
Mode and number of proofs:
`validate_claims(+term,+list(compound),+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
A required claim is missing:
`domain_error(jwt_claims,missing(Name))`
A claim has an invalid value:
`domain_error(jwt_claim(Name),Value)`
`Policy` contains an invalid claim policy:
`domain_error(jwt_claim_policy,Policy)`
A time claim value is not a number:
`type_error(time_number,Name-Time)`
`Policy` contains an invalid time-claim kind:

`domain_error(jwt_time_claim_kind,Kind)`

`validate_claim/3`

Validates a single JWT claim policy against a claims JSON term.

Compilation flags:
`static`

Template:
`validate_claim(Claims,ClaimPolicy,Options)`
Mode and number of proofs:
`validate_claim(+term,+compound,+list(compound))` - `one_or_error`

Exceptions:
A required claim is missing:
`domain_error(jwt_claims,missing(Name))`
A claim has an invalid value:
`domain_error(jwt_claim(Name),Value)`
`ClaimPolicy` is not a valid claim policy:
`domain_error(jwt_claim_policy,ClaimPolicy)`
A time claim value is not a number:
`type_error(time_number,Name-Time)`
`ClaimPolicy` contains an invalid time-claim kind:
`domain_error(jwt_time_claim_kind,Kind)`

Protected predicates

(none)
object

1.174.2 jwt_claims

Reusable JWT registered-claim validation helpers.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-06-26

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *jwt_helpers*
Uses:
list
os

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *validate_claims/3*
  - *validate_claim/3*
  - *claim/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

validate_claims/3

Validates JWT claims using registered-claim defaults, a policy list, and options.

Compilation flags:
`static`

Template:
`validate_claims(Claims,Policy,Options)`
Mode and number of proofs:
`validate_claims(+term,+list(compound),+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:

```
instantiation_error
```

`Options` is neither a variable nor a list:

```
type_error(list,Options)
```

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

A required claim is missing:

```
domain_error(jwt_claims,missing(Name))
```

A claim has an invalid value:

```
domain_error(jwt_claim(Name),Value)
```

`Policy` contains an invalid claim policy:

```
domain_error(jwt_claim_policy,Policy)
```

A time claim value is not a number:

```
type_error(time_number,Name-Time)
```

`Policy` contains an invalid time-claim kind:

```
domain_error(jwt_time_claim_kind,Kind)
```

---

validate_claim/3

Validates a single JWT claim policy against a claims JSON term.

Compilation flags:

```
static
```

Template:

```
validate_claim(Claims,ClaimPolicy,Options)
```

Meta-predicate template:

```
validate_claim(*,*,*)
```

Mode and number of proofs:

```
validate_claim(+term,+compound,+list(compound)) - one_or_error
```

Exceptions:

A required claim is missing:

```
domain_error(jwt_claims,missing(Name))
```

A claim has an invalid value:

```
domain_error(jwt_claim(Name),Value)
```

`ClaimPolicy` is not a valid claim policy:

```
domain_error(jwt_claim_policy,ClaimPolicy)
```

A time claim value is not a number:

```
type_error(time_number,Name-Time)
```

`ClaimPolicy` contains an invalid time-claim kind:

```
domain_error(jwt_time_claim_kind,Kind)
```

`claim/3`

Looks up a claim value by name in a claims JSON term.

Compilation flags:
`static`

Template:
`claim(Claims,Name,Value)`
Mode and number of proofs:
`claim(+term,+atom,-term)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.174.3 `jwt_compact`

JWT compact serialization parsing and generation helpers.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-06

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *jwt_helpers*
Uses:
atom
json
user

Remarks:
(none)

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *decode/3*
  - *decode/5*
  - *header/2*
  - *claims/2*
  - *segments/5*
  - *signing_input/4*
  - *compact/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

decode/3

Decodes a compact JWT into header and claims JSON terms without verifying the signature.

Compilation flags:

`static`

Template:

`decode(Token,Header,Claims)`

Mode and number of proofs:

`decode(+atom,-term,-term)` - `one_or_error`

Exceptions:

`Token` is a variable:

`instantiation_error`

`Token` is neither a variable nor an atom:

`type_error(atom,Token)`

`Token` is an atom but not a valid compact JWT:

`domain_error(jwt_compact_serialization,Token)`

`Token` contains Base64URL data with characters outside the Base64URL alphabet:

`representation_error(base64)`

decode/5

Decodes a compact JWT into header, claims, signature bytes, and signing input.

Compilation flags:
`static`

Template:
`decode(Token,Header,Claims,Signature,SigningInput)`
Mode and number of proofs:
`decode(+atom,-term,-term,-list(byte),-atom)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

header/2

Decodes only the JWT header JSON term.

Compilation flags:
`static`

Template:
`header(Token,Header)`
Mode and number of proofs:
`header(+atom,-term)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

claims/2

Decodes only the JWT claims JSON term.

Compilation flags:
`static`

Template:
`claims(Token,Claims)`
Mode and number of proofs:
`claims(+atom,-term)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

segments/5

Splits a compact JWT into Base64URL segments and signing input.

Compilation flags:
`static`

Template:
`segments(Token,HeaderSegment,PayloadSegment,SignatureSegment,SigningInput)`
Mode and number of proofs:
`segments(+atom,-atom,-atom,-atom,-atom)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a valid compact JWT:
`domain_error(jwt_compact_serialization,Token)`

---

signing_input/4

Encodes header and payload JSON terms and returns the compact signing input.

Compilation flags:
`static`

Template:
`signing_input(Header,Payload,HeaderSegment,SigningInput)`
Mode and number of proofs:
`signing_input(+term,+term,-atom,-atom)` - `one_or_error`

Exceptions:
`Header` or `Payload` cannot be encoded as JSON:
`domain_error(json_sink,HeaderOrPayload)`
`Header` or `Payload` cannot be encoded as Base64URL bytes:
`domain_error(base64url_sink,codes(Codes))`

---

compact/4

Builds a compact JWT from a signing input and signature bytes.

Compilation flags:
`static`

Template:
`compact(HeaderSegment,SigningInput,Signature,Token)`
Mode and number of proofs:
`compact(+atom,+atom,+list(byte),-atom)` - `one_or_error`

Exceptions:
`Signature` cannot be encoded as Base64URL bytes:
`domain_error(base64url_sink,codes(Codes))`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

1.174.4 `jwt_der`

DER and PEM helpers for JWK public keys and JOSE signatures.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-06

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *jwt_helpers*
Uses:
base64
list
user

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *public_key_pem/2*
  - *es256_signature_der/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

public_key_pem/2

Converts a supported JWK public key into PEM SubjectPublicKeyInfo text.

Compilation flags:
`static`

Template:
`public_key_pem(Key,PEM)`
Mode and number of proofs:
`public_key_pem(+term,-atom)` - `one_or_error`

Exceptions:
`Key` is not a supported RSA or P-256 EC public JWK:
`domain_error(jwt_jwk_public_key,Key)`
`Key` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

es256_signature_der/2

Converts a raw JOSE ES256 signature into DER-encoded ASN.1 form.

Compilation flags:
`static`

Template:
`es256_signature_der(Signature,DER)`
Mode and number of proofs:
`es256_signature_der(+list(byte),-list(byte))` - `one_or_error`

Exceptions:
`Signature` is not a 64-byte raw ES256 signature:
`domain_error(jwt_es256_signature,Signature)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
category

1.174.5 `jwt_helpers`

Internal shared helpers for the jwt library.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-06

Compilation flags:
`static`

Extends:
`public` *options*
Uses:
base64url_no_padding
list

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
- *Protected predicates*
  - *json_member/3*
  - *json_member_default/4*
  - *json_object_pairs/2*
  - *json_object/1*
  - *pair_key_value/3*
  - *base64url_atom_bytes/2*
  - *atom_bytes/2*
  - *bytes_atom/2*
  - *atom_list/1*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

json_member/3

Enumerates JSON object member values for a given key.

Compilation flags:
`static`

Template:
`json_member(Key,Object,Value)`
Mode and number of proofs:
`json_member(+atom,+term,-term)` - `zero_or_more`

---

json_member_default/4

Returns a JSON object member value or a default when the key is absent.

Compilation flags:
`static`

Template:
`json_member_default(Key,Object,Default,Value)`
Mode and number of proofs:
`json_member_default(+atom,+term,+term,-term)` - `one`

---

json_object_pairs/2

Extracts the key-value pairs from a JSON object term.

Compilation flags:
`static`

Template:
`json_object_pairs(Object,Pairs)`
Mode and number of proofs:
`json_object_pairs(+term,-list(compound))` - `zero_or_one`

---

json_object/1

Validates that a JSON term is an object without duplicate member names.

Compilation flags:
`static`

Template:
`json_object(Object)`
Mode and number of proofs:
`json_object(+term)` - `one_or_error`

Exceptions:
`Object` is not a JSON object or contains duplicate member names:
`domain_error(jwt_json_object,Object)`

---

pair_key_value/3

Extracts the key and value from a JSON pair compound term.

Compilation flags:
`static`

Template:
`pair_key_value(Pair,Key,Value)`
Mode and number of proofs:
`pair_key_value(+compound,-term,-term)` - `one`

---

base64url_atom_bytes/2

Converts between unpadded Base64URL atoms and byte lists.

Compilation flags:
`static`

Template:
`base64url_atom_bytes(Atom,Bytes)`
Mode and number of proofs:
`base64url_atom_bytes(+atom,-list(byte))` - `one_or_error`
`base64url_atom_bytes(-atom,+list(byte))` - `one_or_error`

Exceptions:
`Atom` is a variable or the sink is a variable:
`instantiation_error`
`Atom` is neither a variable nor a valid Base64URL source term:

`domain_error(base64url_source,codes(Codes))`
`Bytes` cannot be encoded in the requested Base64URL sink representation:
`domain_error(base64url_sink,codes(Codes))`
`Atom` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

atom_bytes/2

Converts between an atom and its byte list representation.

Compilation flags:
`static`

Template:
`atom_bytes(Atom,Bytes)`
Mode and number of proofs:
`atom_bytes(+atom,-list(byte))` - `one`
`atom_bytes(-atom,+list(byte))` - `one`

---

bytes_atom/2

Converts a byte list into an atom.

Compilation flags:
`static`

Template:
`bytes_atom(Bytes,Atom)`
Mode and number of proofs:
`bytes_atom(+list(byte),-atom)` - `one`

---

atom_list/1

Validates that a list contains only atoms.

Compilation flags:
`static`

Template:
`atom_list(Atoms)`
Mode and number of proofs:
`atom_list(+list(atom))` - `zero_or_one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.174.6 `jwt_jwa`

JSON Web Algorithm metadata and header helpers.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-06

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *jwt_helpers*
Uses:
list

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *header_algorithm/2*
  - *header_key_id/2*
  - *validate_header/1*
  - *allowed_algorithm/2*
  - *supported_algorithm/1*
  - *key_type/2*
  - *hmac_hash/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

header_algorithm/2

Extracts and validates the JWT header algorithm.

Compilation flags:
`static`

Template:
`header_algorithm(Header,Algorithm)`
Mode and number of proofs:
`header_algorithm(+term,-atom)` - `one_or_error`

Exceptions:
`Header` does not contain a valid `alg` member:
`domain_error(jwt_header,Header)`

---

header_key_id/2

Extracts the optional key identifier from a JWT header.

Compilation flags:
`static`

Template:
`header_key_id(Header,KeyId)`
Mode and number of proofs:
`header_key_id(+term,-atom)` - `zero_or_one`

---

validate_header/1

Validates a JWT header object and rejects unsupported critical header parameters.

Compilation flags:
`static`

Template:
`validate_header(Header)`
Mode and number of proofs:
`validate_header(+term)` - `one_or_error`

Exceptions:
`Header` is not a JSON object, contains duplicate member names, or contains unsupported critical header parameters:
`domain_error(jwt_header,Header)`

---

allowed_algorithm/2

Validates that an algorithm is supported and allowed by the options.

Compilation flags:
`static`

Template:
`allowed_algorithm(Algorithm,Options)`
Mode and number of proofs:
`allowed_algorithm(+atom,+list(compound))` - `one_or_error`

Exceptions:
`Algorithm` is unsupported or disallowed by `Options`:
`domain_error(jwt_algorithm,Algorithm)`

---

supported_algorithm/1

Succeeds when the algorithm is supported by this library.

Compilation flags:
`static`

Template:
`supported_algorithm(Algorithm)`
Mode and number of proofs:
`supported_algorithm(+atom)` - `zero_or_one`

---

key_type/2

Maps a supported algorithm to the required JWK key type.

Compilation flags:
`static`

Template:
`key_type(Algorithm,KeyType)`
Mode and number of proofs:
`key_type(+atom,-atom)` - `zero_or_one`

---

hmac_hash/2

Maps a supported HMAC algorithm to its hash object.

Compilation flags:
`static`

Template:
`hmac_hash(Algorithm,Hash)`
Mode and number of proofs:
`hmac_hash(+atom,-object_identifier)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.174.7 jwt_jwk

JSON Web Key normalization and key material helpers.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:1
Date: 2026-07-26

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *jwt_helpers*
Uses:
jwt_der
list

Remarks:
(none)

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *public_key_pem/2*
  - *symmetric_key_bytes/2*
  - *compatible_key/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

public_key_pem/2

Converts a supported JWK public key into PEM SubjectPublicKeyInfo text.

Compilation flags:
`static`

Template:
`public_key_pem(Key,PEM)`
Mode and number of proofs:
`public_key_pem(+term,-atom)` - `one_or_error`

Exceptions:
`Key` is not a supported RSA or P-256 EC public JWK:
`domain_error(jwt_jwk_public_key,Key)`
`Key` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

symmetric_key_bytes/2

Extracts symmetric key bytes from an atom, byte wrapper, or octet JWK.

Compilation flags:
`static`

Template:
`symmetric_key_bytes(Key,Bytes)`
Mode and number of proofs:
`symmetric_key_bytes(+term,-list(byte))` - `one_or_error`

Exceptions:
`Key` is not an atom, byte wrapper, or octet JWK with Base64URL key material:
`domain_error(jwt_symmetric_key,Key)`

`Key` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

`compatible_key/2`

Succeeds when a key is compatible with the requested JWT algorithm.

Compilation flags:
`static`

Template:
`compatible_key(Key,Algorithm)`
Mode and number of proofs:
`compatible_key(+term,+atom)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.174.8 `jwt_jwks`

JSON Web Key Set validation and key selection helpers.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-06

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *jwt_helpers*
Uses:
jwt_jwa

jwt_jwk
list

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *validate/1*
  - *select_key/3*
  - *select_key/4*
  - *select_keys/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

validate/1

Validates that a term is a JSON Web Key Set.

Compilation flags:
`static`

Template:
`validate(JWKSet)`
Mode and number of proofs:
`validate(+term)` - `one_or_error`

Exceptions:
`JWKSet` is not a JSON Web Key Set with a `keys` list:
`domain_error(jwt_jwks,JWKSet)`

---

select_key/3

Selects a matching verification key from a JWK Set for a JWT header.

Compilation flags:
`static`

Template:
`select_key(JWKSet,Header,Key)`

Mode and number of proofs:

`select_key(+term,+term,-term)` - `one_or_error`

Exceptions:

`JWKSet` is not a JSON Web Key Set with a `keys` list:

`domain_error(jwt_jwks,JWKSet)`

`Header` does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(jwt_algorithm,Algorithm)`

No compatible key exists for `Header`:

`existence_error(jwt_jwk,Header)`

`select_key/4`

Selects a matching verification key from a JWK Set for a JWT header and options.

Compilation flags:

`static`

Template:

`select_key(JWKSet,Header,Key,Options)`

Mode and number of proofs:

`select_key(+term,+term,-term,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`JWKSet` is not a JSON Web Key Set with a `keys` list:

`domain_error(jwt_jwks,JWKSet)`

`Header` does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(jwt_algorithm,Algorithm)`

No compatible key exists for `Header`:

`existence_error(jwt_jwk,Header)`

---

select_keys/4

Selects all matching verification keys from a JWK Set for a JWT header and options.

Compilation flags:
`static`

Template:
`select_keys(JWKSet,Header,Keys,Options)`
Mode and number of proofs:
`select_keys(+term,+term,-list(term),+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`JWKSet` is not a JSON Web Key Set with a `keys` list:
`domain_error(jwt_jwks,JWKSet)`
`Header` does not contain a valid `alg` member:
`domain_error(jwt_header,Header)`
The JWT algorithm is unsupported or disallowed:
`domain_error(jwt_algorithm,Algorithm)`
No compatible key exists for `Header`:
`existence_error(jwt_jwk,Header)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.174.9 `jwt_jws`

JWS signing input construction and signature algorithm dispatch.

Availability:
`logtalk_load(jwt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-06

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *jwt_helpers*
Uses:
hmac
jwt_compact
jwt_jwa
jwt_jwk
jwt_openssl

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *verify/5*
  - *sign/5*
  - *sign_payload/5*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

`verify/5`

Verifies a JWS signature for a signing input, algorithm, key, and options.

Compilation flags:
`static`

Template:
`verify(Algorithm,SigningInput,Signature,Key,Options)`

Mode and number of proofs:

`verify(+atom,+atom,+list(byte),+term,+list(compound))` - `zero_or_one_or_error`

Exceptions:

`Algorithm` is unsupported:

`domain_error(jwt_algorithm,Algorithm)`

`Key` is not a valid symmetric key:

`domain_error(jwt_symmetric_key,Key)`

`Key` is not a supported public JWK:

`domain_error(jwt_jwk_public_key,Key)`

`Signature` is not a 64-byte raw ES256 signature:

`domain_error(jwt_es256_signature,Signature)`

The OpenSSL executable does not exist:

`existence_error(os_command,Executable)`

`sign/5`

Signs claims as a compact JWT using the given header, key, and options.

Compilation flags:

`static`

Template:

`sign(Header,Claims,Key,Token,Options)`

Mode and number of proofs:

`sign(+term,+term,+term,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Header` does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(jwt_algorithm,Algorithm)`

`Header` or `Claims` cannot be encoded as JSON:

`domain_error(json_sink,HeaderOrClaims)`

`Key` is not a valid symmetric key:

`domain_error(jwt_symmetric_key,Key)`

`Algorithm` is not a supported signing algorithm:

`domain_error(jwt_signing_algorithm,Algorithm)`

---

sign_payload/5

Signs a payload JSON term as a compact JWS using the given header, key, and options.

Compilation flags:

`static`

Template:

`sign_payload(Header,Payload,Key,Token,Options)`

Mode and number of proofs:

`sign_payload(+term,+term,+term,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Header` does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(jwt_algorithm,Algorithm)`

`Header` or `Payload` cannot be encoded as JSON:

`domain_error(json_sink,HeaderOrPayload)`

`Key` is not a valid symmetric key:

`domain_error(jwt_symmetric_key,Key)`

`Algorithm` is not a supported signing algorithm:

`domain_error(jwt_signing_algorithm,Algorithm)`

Public predicates

predict/4

Predicts the class label for a new instance using the learned classifier and the given options. The instance is a list of `Attribute-Value` pairs.

Compilation flags:

```
static
```

Template:

```
predict(Classifier,Instance,Class,Options)
```

Mode and number of proofs:

```
predict(+compound,+list,-atom,+list(compound)) - one
```

---

predict_probabilities/4

Predicts class probabilities for a new instance using the learned classifier and the given options. Returns a list of `Class-Probability` pairs. The instance is a list of `Attribute-Value` pairs.

Compilation flags:

```
static
```

Template:

```
predict_probabilities(Classifier,Instance,Probabilities,Options)
```

Mode and number of proofs:

```
predict_probabilities(+compound,+list,-list,+list(compound)) - one
```

1.185 knn_forecasting

object

1.185.1 `knn_forecasting`

k-Nearest Neighbors (analog method) time series forecaster: matches the most recent window of observations against historical windows of the same length and predicts by aggregating what followed the most similar ones. Supports multiple distance metrics, neighbor weighting schemes, optional differencing, and missing observations represented as unbound variables.

Availability:

```
logtalk_load(knn_forecasting(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-14

Compilation flags:

```
static, context_switching_calls
```

Imports:

```
public forecaster_common
```

Uses:

format
list
numberlist
type

Remarks:

(none)

Inherited public predicates:

- *Public predicates*
  - *update/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

update/3

Returns a new forecaster after appending one observation. Observation may be left an unbound variable to represent a missing observation; see update/4.

Compilation flags:

static

Template:

update(Forecaster,Observation,UpdatedForecaster)

Mode and number of proofs:

update(+compound,@number,-compound) - one_or_error

Exceptions:

Forecaster is a variable:

instantiation_error

Forecaster is neither a variable nor a valid forecaster:

domain_error(forecaster,Forecaster)

Observation is neither a variable nor a number:

type_error(number,Observation)

Protected predicates

Public predicates

(none)

Protected predicates

cosine_similarity/3

Computes cosine similarity between two lexically sorted sparse count vectors.

Compilation flags:

```
static
```

Template:

```
cosine_similarity(Counts1,Counts2,Similarity)
```

Mode and number of proofs:

```
cosine_similarity(+list(pair(atom,positive_integer)),+list(pair(atom,
positive_integer)),-float) - one
```

---

normalize_scores/2

Normalizes non-negative scores to sum to one or returns an empty list when their total is zero.

Compilation flags:

```
static
```

Template:

```
normalize_scores(RawScores,Scores)
```

Mode and number of proofs:

```
normalize_scores(+list(pair(atom,number)),-list(pair(atom,float))) - one
```

---

squared_norm/2

Computes the squared norm of a sparse count vector.

Compilation flags:

```
static
```

Template:

```
squared_norm(Counts,SquareSum)
```

Mode and number of proofs:

```
squared_norm(+list(pair(atom,positive_integer)),-float) - one
```

`cosine_similarity/5`

Computes cosine similarity using precomputed squared norms.

Compilation flags:
`static`

Template:
`cosine_similarity(Counts1,SquareSum1,Counts2,SquareSum2,Similarity)`
Mode and number of proofs:
`cosine_similarity(+list,+float,+list,+float,-float)` - `one`

Private predicates

(none)

Operators

(none)
object

1.191.35 `language_detection_scripts`

Unicode script analysis and language script registry.

Availability:
`logtalk_load(language_detection(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-07

Compilation flags:
`static, context_switching_calls`

Uses:
list
user

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*

      - *script_ratios/2*
      - *language_scripts/2*

      - *custom_language_scripts/2*
      - *scripts_to_languages/2*
    - *Protected predicates*
    - *Private predicates*
    - *Operators*

Public predicates

script_ratios/2

Returns observed Unicode scripts and their ratios ordered by decreasing ratio and then by script name.

Compilation flags:
```
static
```

Template:
```
script_ratios(Codes,ScriptRatios)
```
Mode and number of proofs:
```
script_ratios(+list(character_code),-list(pair(atom,float))) - one
```

---

language_scripts/2

Enumerates effective ISO 639-1 language codes and their expected Unicode scripts. Custom mappings override default mappings.

Compilation flags:
```
static
```

Template:
```
language_scripts(Language,Scripts)
```
Mode and number of proofs:
```
language_scripts(?atom,?list(atom)) - zero_or_more
```

---

default_language_scripts/2

Enumerates default ISO 639-1 language codes and their expected Unicode scripts.

Compilation flags:
```
static
```

Template:

```
default_language_scripts(Language,Scripts)
```
Mode and number of proofs:
```
default_language_scripts(?atom,?list(atom)) - zero_or_more
```

---

custom_language_scripts/2

Enumerates custom ISO 639-1 language codes and their expected Unicode scripts.

Compilation flags:
```
static, multifile
```

Template:
```
custom_language_scripts(Language,Scripts)
```
Mode and number of proofs:
```
custom_language_scripts(?atom,?list(atom)) - zero_or_more
```

---

scripts_to_languages/2

Returns the sorted unique registered languages compatible with any meaningful script in the given list.

Compilation flags:
```
static
```

Template:
```
scripts_to_languages(Scripts,Languages)
```
Mode and number of proofs:
```
scripts_to_languages(+list(atom),-list(atom)) - one
```

Public predicates

detect/2

Detects the most likely language and returns its ISO 639-1 code.

Compilation flags:

`static`

Template:

`detect(Text,Language)`

Mode and number of proofs:

`detect(+text,-atom)` - `zero_or_one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Strategy` parameter is a variable:

`instantiation_error`

The `Strategy` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Strategy)`

The `Strategy` parameter is an object identifier but not an object conforming to `language_detection_strategy_protocol`:

`domain_error(language_detection_strategy_protocol,Strategy)`

detect/3

Detects the most likely language and returns its ISO 639-1 code and relative detection score.

Compilation flags:
`static`

Template:
`detect(Text,Language,Score)`
Mode and number of proofs:
`detect(+text,-atom,-float)` - `zero_or_one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Strategy` parameter is a variable:
`instantiation_error`
The `Strategy` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Strategy)`
The `Strategy` parameter is an object identifier but not an object conforming to `language_detection_strategy_protocol`:
`domain_error(language_detection_strategy_protocol,Strategy)`

---

detect/4

Detects the most likely language using the given options and returns its ISO 639-1 code and relative detection score.

Compilation flags:
`static`

Template:
`detect(Text,Language,Score,Options)`
Mode and number of proofs:
`detect(+text,-atom,-float,+list(compound))` - `zero_or_one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Strategy` parameter is a variable:
`instantiation_error`
The `Strategy` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Strategy)`
The `Strategy` parameter is an object identifier but not an object conforming to `language_detection_strategy_protocol`:

`domain_error(language_detection_strategy_protocol,Strategy)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`detect_all/2`

Returns candidate languages ranked by descending relative detection score or an empty list when there is insufficient evidence.

Compilation flags:

`static`

Template:

`detect_all(Text,ScoredLanguages)`

Mode and number of proofs:

`detect_all(+text,-list(pair(atom,float)))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Strategy` parameter is a variable:

`instantiation_error`

The `Strategy` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Strategy)`

The `Strategy` parameter is an object identifier but not an object conforming to `language_detection_strategy_protocol`:

`domain_error(language_detection_strategy_protocol,Strategy)`

---

detect_all/3

Returns candidate languages ranked by descending relative detection score using the given options or an empty list when there is insufficient evidence.

Compilation flags:

`static`

Template:

`detect_all(Text,ScoredLanguages,Options)`

Mode and number of proofs:

`detect_all(+text,-list(pair(atom,float)),+list(compound))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Strategy` parameter is a variable:

`instantiation_error`

The `Strategy` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Strategy)`

The `Strategy` parameter is an object identifier but not an object conforming to `language_detection_strategy_protocol`:

`domain_error(language_detection_strategy_protocol,Strategy)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

language_detection_strategy_protocol

category

1.191.40 `language_profile_common`

Shared predicates for language detection profiles.

Availability:
`logtalk_load(language_detection(loader))`

Author: Paulo Moura
Version: 1:1:0
Date: 2026-10-15

Compilation flags:
`static`

Implements:
`public` *language_profile_protocol*
Uses:
list
n_grams(Representation)
user

Remarks:
(none)

Inherited public predicates:
language/1 *stop_word/1*

- *Public predicates*
  - *trigram_counts/1*
  - *trigram_counts/2*
- *Protected predicates*

- *Private predicates*
  - *trigram_counts_/2*
- *Operators*

Public predicates

trigram_counts/1

Returns trigram counts derived from the profile stop-word inventory.

Compilation flags:
```
static
```

Template:
```
trigram_counts(Counts)
```
Mode and number of proofs:
```
trigram_counts(-list(pair(atom,positive_integer)))-one
```

---

trigram_counts/2

Returns the profile trigram counts and their squared norm, using cached values when available.

Compilation flags:
```
static
```

Template:
```
trigram_counts(Counts,SquareSum)
```
Mode and number of proofs:
```
trigram_counts(-list(pair(atom,positive_integer)),-float)-one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

trigram_counts_/2

Returns cached profile trigram counts and their squared norm when available.

Compilation flags:
```
static
```

Template:

```
trigram_counts_(Counts,SquareSum)
```

Mode and number of proofs:

```
trigram_counts_(-list(pair(atom,positive_integer)),-float) - zero_or_one
```

Operators

(none)

object

1.191.41 language_profile_expansion

Computes and stores trigram vectors and squared norms when loading language profiles.

Availability:

```
logtalk_load(language_detection(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-15

Compilation flags:

```
static, context_switching_calls
```

Implements:

```
public expanding
```

Uses:

list
n_grams(Representation)
user

Remarks:

(none)

Inherited public predicates:

goal_expansion/2 *term_expansion/2*

- *Public predicates*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.191.42 `language_profile_protocol`

Language detection profile protocol.

Availability:
`logtalk_load(language_detection(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-06

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *language/1*
  - *trigram_counts/1*
  - *stop_word/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

language/1

Returns the profile ISO 639-1 language code.

Compilation flags:
`static`

Template:
`language(Language)`
Mode and number of proofs:
`language(-atom) - one`

---

trigram_counts/1

Returns the lexically sorted character-trigram count vector.

Compilation flags:
`static`

Template:
`trigram_counts(Counts)`
Mode and number of proofs:
`trigram_counts(-list(pair(text,positive_integer))) - one`

---

stop_word/1

Enumerates canonical lowercase stop words.

Compilation flags:
`static`

Template:
`stop_word(Word)`
Mode and number of proofs:
`stop_word(?atom) - zero_or_more`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
object

1.191.43 `language_profiles`

Registry of language detection profiles.

Availability:
`logtalk_load(language_detection(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-06

Compilation flags:
`static, context_switching_calls`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *profile/2*
  - *default_profile/2*
  - *custom_profile/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

profile/2

Enumerates the effective ISO 639-1 language codes and profile objects. Custom profiles override default profiles for the same language code.

Compilation flags:

```
static
```

Template:

```
profile(Language,Profile)
```

Mode and number of proofs:

```
profile(?atom,?object_identifier) - zero_or_more
```

---

default_profile/2

Enumerates default built-in ISO 639-1 language codes and profile objects.

Compilation flags:

```
static, multifile
```

Template:

```
default_profile(Language,Profile)
```

Mode and number of proofs:

```
default_profile(?atom,?object_identifier) - zero_or_more
```

---

custom_profile/2

Enumerates custom ISO 639-1 language codes and profile objects.

Compilation flags:

```
static, multifile
```

Template:

```
custom_profile(Language,Profile)
```

Mode and number of proofs:

```
custom_profile(?atom,?object_identifier) - zero_or_more
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

usable_examples/3

Counts known numeric targets after shared dataset validation.

Compilation flags:

```
static
```

Template:

```
usable_examples(Examples,Dataset,Count)
```

Mode and number of proofs:

```
usable_examples(+list(compound),+object_identifier,-non_negative_integer) -
one_or_error
```

Exceptions:

A known target is not numeric:

```
type_error(number,Target)
```

No known target remains:

```
domain_error(non_empty_examples,Dataset)
```

---

count_numeric_targets/2

Counts numeric targets while skipping unbound targets.

Compilation flags:

```
static
```

Template:

```
count_numeric_targets(Examples,Count)
```

Mode and number of proofs:

```
count_numeric_targets(+list(compound),-non_negative_integer) - one_or_error
```

Exceptions:

A known target is not numeric:

```
type_error(number,Target)
```

---

check_search_count/1

Requires at least two known numeric targets for holdout search.

Compilation flags:

```
static
```

Template:

```
check_search_count(Count)
```

Mode and number of proofs:

```
check_search_count(+non_negative_integer) - one_or_error
```

Exceptions:

Fewer than two usable rows remain:

```
domain_error(lasso_search_examples,Count)
```

---

group_scores/3

Consumes exact encoder blocks and returns original feature scores in encoder order.

Compilation flags:

```
static
```

Template:

```
group_scores(Encoders,Weights,Scores)
```

Mode and number of proofs:

```
group_scores(+list(compound),+list(float),-list(pair)) - zero_or_one
```

---

encoder_block/3

Returns an encoder name and its number of coefficient columns.

Compilation flags:

```
static
```

Template:

```
encoder_block(Encoder,Feature,Count)
```

Mode and number of proofs:

```
encoder_block(+compound,-atom,-positive_integer) - zero_or_one
```

---

block_maximum/5

Consumes a coefficient block and computes its maximum absolute weight.

Compilation flags:
`static`

Template:
`block_maximum(Count,Weights,Maximum0,Maximum,Remaining)`
Mode and number of proofs:
`block_maximum(+non_negative_integer,+list(float),+float,-float,-list(float))` - `zero_or_one`

---

select_active/3

Applies the selection strategy only to groups strictly above the coefficient cutoff.

Compilation flags:
`static`

Template:
`select_active(Scores,Options,Selected)`
Mode and number of proofs:
`select_active(+list(pair),+list(compound),-list(atom))` - `one`

---

active_scores/3

Retains scores strictly above the coefficient cutoff.

Compilation flags:
`static`

Template:
`active_scores(Scores,Cutoff,Active)`
Mode and number of proofs:
`active_scores(+list(pair),+number,-list(pair))` - `one`

---

model_diagnostics/8

Builds counts, effective options, aggregation metadata, and complete nested learner diagnostics.

Compilation flags:

```
static
```

Template:

```
model_diagnostics(Regressor,Scores,Selected,OriginalCount,UsableCount,Options,
SearchResult,Diagnostics)
```

Mode and number of proofs:

```
model_diagnostics(+compound,+list(pair),+list(atom),+positive_integer,
+positive_integer,+list(compound),+term,-list(compound)) - one
```

---

valid_model/1

Checks the retained regressor and recomputes scores, selection, and metadata without binding a partial input.

Compilation flags:

```
static
```

Template:

```
valid_model(Selector)
```

Mode and number of proofs:

```
valid_model(+ground) - zero_or_one
```

Exceptions:

The retained regressor is invalid:

```
domain_error(regressor,Regressor)
```

A stored option is invalid:

```
domain_error(option,Option)
```

A generated regularization bound exceeds backend floating-point limits:

```
evaluation_error(float_overflow)
```

Stored options are not a list:

```
type_error(list,Options)
```

A stored option is not compound:

```
type_error(compound,Option)
```

---

store_regressor_options/3

Replaces the first nested options occurrence with the learner effective options, preserving later occurrences.

Compilation flags:
```
static
```

Template:
```
store_regressor_options(Options,RegressorOptions,Stored)
```
Mode and number of proofs:
```
store_regressor_options(+list(compound),+list(compound),-list(compound)) - one
```

---

complete_regressor_options/2

Checks that each learner default option indicator has an effective value.

Compilation flags:
```
static
```

Template:
```
complete_regressor_options(Defaults,Options)
```
Mode and number of proofs:
```
complete_regressor_options(+list(compound),+list(compound)) - zero_or_one
```

---

valid_regularization_grid/1

Checks an explicit penalty list or an increasing bounded linear grid with at least two candidates.

Compilation flags:
```
static
```

Template:
```
valid_regularization_grid(Grid)
```
Mode and number of proofs:
```
valid_regularization_grid(@term) - zero_or_one
```

`regularization_grid_values/2`

Expands a validated linear grid to floating-point penalties or preserves an explicit penalty list.

Compilation flags:
`static`

Template:
`regularization_grid_values(Grid,Values)`
Mode and number of proofs:
`regularization_grid_values(+term,-list(number))` - `one_or_error`

Exceptions:
A generated bound exceeds backend floating-point limits:
`evaluation_error(float_overflow)`

Operators

(none)
object

1.192.2 `regression_dataset_adapter(Dataset)`

- `Dataset` - Feature dataset object.

Transient regression view of a feature dataset, preserving missing features and excluding unknown targets.

Availability:
`logtalk_load(lasso_feature_selector(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-12

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *regression_dataset_protocol*
Uses:
list
type

Remarks:
(none)

Inherited public predicates:

- *Private predicates*
  - *check_declarations/1*
  - *distinct_values/1*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

check_declarations/1

Checks distinct atom feature names and continuous or non-empty, distinct atomic categorical domains.

Compilation flags:

```
static
```

Template:

```
check_declarations(Declarations)
```

Mode and number of proofs:

```
check_declarations(+list(pair)) - one_or_error
```

Exceptions:

A feature declaration is unsupported:

```
domain_error(feature_type,Feature-Values)
```

A feature is declared more than once:

```
domain_error(duplicate_feature,Feature)
```

---

distinct_values/1

True when categorical values are pairwise distinct.

Compilation flags:

```
static
```

Template:

```
distinct_values(Values)
```

Mode and number of proofs:

```
distinct_values(+list(atomic)) - zero_or_one
```

Operators

(none)
object

1.192.3 regression_examples_adapter(Declarations,Examples)

- `Declarations` - Validated feature declarations.
- `Examples` - Validated feature dataset examples.

Transient materialized regression subset with validated declarations and numeric targets.

Public predicates

lemma/2

Enumerates the distinct lemmas of a word in provider preference order. Returns the normalized word when no lemma is recognized.

Compilation flags:

`static`

Template:

`lemma(Word,Lemma)`

Mode and number of proofs:

`lemma(+text,-text)` - `one_or_more_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Language` parameter is a variable:

`instantiation_error`

The `Language` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Language)`

The `Language` parameter is an object identifier but not an object conforming to `lemmatizer_language_protocol`:

`domain_error(lemmatizer_language_protocol,Language)`

`Word` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Word` is not an atom:

`type_error(atom,Word)`

The `Representation` parameter is `chars` but `Word` is not a list of characters:

`type_error(chars,Word)`

The `Representation` parameter is `codes` but `Word` is not a list of character codes:

`type_error(codes,Word)`

---

lemma/3

Lemmatizes a word using the given options. Recognized options are `part_of_speech(PartOfSpeech)`, `ambiguity(Policy)`, where `Policy` is `first` or `all`, and `unknown(Policy)`, where `Policy` is `normalize`, `preserve`, or `fail`.

Compilation flags:

`static`

Template:

`lemma(Word,Lemma,Options)`

Mode and number of proofs:

`lemma(+text,-text,+list(compound))` - `zero_or_more_or_error`

Exceptions:

The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Language` parameter is a variable:
`instantiation_error`
The `Language` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Language)`
The `Language` parameter is an object identifier but not an object conforming to `lemmatizer_language_protocol`:
`domain_error(lemmatizer_language_protocol,Language)`
`Word` is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but `Word` is not an atom:
`type_error(atom,Word)`
The `Representation` parameter is `chars` but `Word` is not a list of characters:
`type_error(chars,Word)`
The `Representation` parameter is `codes` but `Word` is not a list of character codes:
`type_error(codes,Word)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
An element of the list `Options` is a `parts_of_speech/1` option, which is only valid for `lemmas/3`:
`domain_error(option,parts_of_speech(A))`

`lemmas/2`

Lemmatizes a list of words, selecting the first lemma for each word and preserving order. Returns normalized words when no lemma is recognized.

Compilation flags:
`static`

Template:
`lemmas(Words,Lemmas)`
Mode and number of proofs:
`lemmas(+list(text),-list(text))` - `one_or_error`

Exceptions:

The Representation parameter is a variable:
instantiation_error
The Representation parameter is neither a variable nor atom, chars, or codes:
domain_error(text_representation,Representation)
The Language parameter is a variable:
instantiation_error
The Language parameter neither a variable nor an object identifier:
type_error(object_identifier,Language)
The Language parameter is an object identifier but not an object conforming to lemmatizer_language_protocol:
domain_error(lemmatizer_language_protocol,Language)
Words is a variable or a partial list:
instantiation_error
Words is neither a variable nor a list:
type_error(list,Words)
An element Word of the list Words is not a ground term:
instantiation_error
The Representation parameter is atom but a ground element Word of the list Words is not an atom:
type_error(atom,Word)
The Representation parameter is chars but an element Word of the list Words is not a list of characters:
type_error(chars,Word)
The Representation parameter is codes but an element Word of the list Words is not a list of character codes:
type_error(codes,Word)

---

lemmas/3

Lemmatizes a list of words using the given options. In addition to the scalar options, accepts parts_of_speech(PartsOfSpeech) for per-word hints. The part_of_speech/1 and parts_of_speech/1 options are mutually exclusive.

Compilation flags:
static

Template:
lemmas(Words,Lemmas,Options)
Mode and number of proofs:
lemmas(+list(text),-list(text),+list(compound)) - zero_or_more_or_error

Exceptions:
The Representation parameter is a variable:
instantiation_error
The Representation parameter is neither a variable nor atom, chars, or codes:
domain_error(text_representation,Representation)
The Language parameter is a variable:
instantiation_error
The Language parameter neither a variable nor an object identifier:
type_error(object_identifier,Language)

The `Language` parameter is an object identifier but not an object conforming to `lemmatizer_language_protocol`:
```
domain_error(lemmatizer_language_protocol,Language)
```
`Words` is a variable or a partial list:
```
instantiation_error
```
`Words` is neither a variable nor a list:
```
type_error(list,Words)
```
An element `Word` of the list `Words` is not a ground term:
```
instantiation_error
```
The `Representation` parameter is `atom` but a ground element `Word` of the list `Words` is not an atom:
```
type_error(atom,Word)
```
The `Representation` parameter is `chars` but an element `Word` of the list `Words` is not a list of characters:
```
type_error(chars,Word)
```
The `Representation` parameter is `codes` but an element `Word` of the list `Words` is not a list of character codes:
```
type_error(codes,Word)
```
`Options` is a variable:
```
instantiation_error
```
`Options` is neither a variable nor a list:
```
type_error(list,Options)
```
An element `Option` of the list `Options` is a variable:
```
instantiation_error
```
An element `Option` of the list `Options` is neither a variable nor a compound term:
```
type_error(compound,Option)
```
An element `Option` of the list `Options` is a compound term but not a valid option:
```
domain_error(option,Option)
```
The `part_of_speech(POS)` and `parts_of_speech(PsOS)` options are both present:
```
consistency_error(mutually_exclusive_options,part_of_speech(POS),
parts_of_speech(PsOS))
```
The `Words` and `PartsOfSpeech` lists have different lengths:
```
consistency_error(same_length,Words,PartsOfSpeech)
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

library_entity_/4

Table of documented entities per library.

Compilation flags:
`dynamic`

Template:
`library_entity_(Library,PrimarySortKey,SecondarySortKey,Entity)`
Mode and number of proofs:
`library_entity_(?atom,?nonvar,?nonvar,?atom)` - `zero_or_more`

---

directory_entity_/4

Table of documented entities per directory.

Compilation flags:
`dynamic`

Template:
`directory_entity_(Directory,PrimarySortKey,SecondarySortKey,Entity)`
Mode and number of proofs:
`directory_entity_(?atom,?nonvar,?nonvar,?atom)` - `zero_or_more`

---

type_entity_/4

Table of documented entities per type.

Compilation flags:
```
dynamic
```

Template:
```
type_entity_(Type,PrimarySortKey,SecondarySortKey,Entity)
```
Mode and number of proofs:
```
type_entity_(?atom,?nonvar,?nonvar,?atom) - zero_or_more
```

---

predicate_entity_/4

Table of public predicates for all documented entities.

Compilation flags:
```
dynamic
```

Template:
```
predicate_entity_(Predicate,PrimarySortKey,SecondarySortKey,Entity)
```
Mode and number of proofs:
```
predicate_entity_(?predicate_indicator,?nonvar,?nonvar,?entity_identifier) -
zero_or_more
```

---

cached_run_/5

Cache of diagnostics collected while generating documentation for a target and merged options.

Compilation flags:
```
dynamic
```

Template:
```
cached_run_(Target,Options,Contexts,Diagnostics,PreflightIssues)
```
Mode and number of proofs:
```
cached_run_(?nonvar,?list(compound),?list(compound),?list(compound),?
list(compound)) - zero_or_more
```

---

active_diagnostic_/1

Diagnostics collected during the current documentation run.

Compilation flags:
`dynamic`

Template:
`active_diagnostic_(Diagnostic)`
Mode and number of proofs:
`active_diagnostic_(?compound)` - `zero_or_more`

---

active_preflight_issue_/1

Preflight issues collected during the current documentation run.

Compilation flags:
`dynamic`

Template:
`active_preflight_issue_(Issue)`
Mode and number of proofs:
`active_preflight_issue_(?compound)` - `zero_or_more`

---

active_collection_mode_/1

Current diagnostics collection mode.

Compilation flags:
`dynamic`

Template:
`active_collection_mode_(Mode)`
Mode and number of proofs:
`active_collection_mode_(?atom)` - `zero_or_one`

protocol

1.197.3 lgtdocp

Documenting tool protocol.

Availability:
`logtalk_load(lgtdoc(loader))`

Author: Paulo Moura
Version: 6:0:0
Date: 2024-03-08

Compilation flags:
`static`

Dependencies:
(none)

Remarks:

- Compiling files for generating XML documentation: All source files must be compiled with the `source_data` flag turned on.
- `xml_spec(Specification)` option: XML documenting files specification format. Possible option values are `dtd` (DTD specification; default) and `xsd` (XML Schema specification).
- `xml_spec_reference(Reference)` option: Reference to the XML specification file in XML documenting files. Possible values are `local` (default; DTD/XSD file in same folder as XML files), `web` (logtalk.org website DTD/XSD file), and `standalone` (no reference to specification files).
- `entity_xsl_file(File)` option: XSLT file to use with generated XML documenting files. Default is `logtalk_entity_to_xml.xsl`, allowing the XML files to be viewed by opening them with a browser supporting XSLT (after running the `lgt2xml.sh` script on the output directory).
- `index_xsl_file(File)` option: XSLT file to use with generated XML documenting files. Default is `logtalk_index_to_xml.xsl`, allowing the XML files to be viewed by opening them with a browser supporting XSLT (after running the `lgt2xml.sh` script on the output directory).
- `xml_docs_directory(Directory)` option: Directory where the XML documenting files will be generated. The default value is `./xml_docs`, a sub-directory of the source files directory.
- `bom(Boolean)` option: Defines if a BOM should be added to the generated XML documenting files.
- `encoding(Encoding)` option: Encoding to be used for the generated XML documenting files.
- `omit_path_prefixes(Prefixes)` option: List of path prefixes (atoms) to omit when writing directory paths. The default value is to omit the home directory.
- `exclude_files(List)` option: List of files to exclude when generating the XML documenting files.
- `exclude_paths(List)` option: List of relative library paths to exclude when generating the XML documenting files (default is `[]`). All sub-directories of the excluded directories are also excluded.
- `exclude_prefixes(List)` option: List of path prefixes to exclude when generating the XML documenting files (default is `[]`).

- `exclude_entities(List)` option: List of entities to exclude when generating the XML documenting files (default is `[]`).
- `sort_predicates(Boolean)` option: Sort entity predicates (default is `false`).
- Known issues: Some options may depend on the used XSL processor. Most XSL processors support DTDs but only some of them support XML Schemas. Some processors (e.g., `fop2`) reject reference to a DTD.

Public predicates

rlibraries/2

Creates XML documenting files for all entities in all given libraries and their sub-libraries using the specified options.

Compilation flags:

```
static
```

Template:

```
rlibraries(Libraries,Options)
```

Mode and number of proofs:

```
rlibraries(+list(atom),+list) - one
```

---

rlibraries/1

Creates XML documenting files for all entities in all given libraries and their sub-libraries using default options.

Compilation flags:

```
static
```

Template:

```
rlibraries(Libraries)
```

Mode and number of proofs:

```
rlibraries(+list(atom)) - one
```

---

rlibrary/2

Creates XML documenting files for all entities in a library and its sub-libraries using the specified options.

Compilation flags:

```
static
```

Template:

```
rlibrary(Library,Options)
```

Mode and number of proofs:

```
rlibrary(+atom,+list) - one
```

Examples:

Generate XML documenting files for all tool entities for later conversion to Markdown files

```
rlibrary(tools,[xslfile('lgtmd.xsl')])
yes
```

---

rlibrary/1

Creates XML documenting files for all entities in a library and its sub-libraries using default options.

Compilation flags:

```
static
```

Template:

```
rlibrary(Library)
```

Mode and number of proofs:

```
rlibrary(+atom) - one
```

Examples:

Generate XML documenting files for all tool entities for direct viewing in a browser (after indexing using the `lgt2xml` script)

```
rlibrary(tools)
yes
```

---

libraries/2

Creates XML documenting files for all entities in all given libraries using the specified options.

Compilation flags:

```
static
```

Template:

```
libraries(Libraries,Options)
```

Mode and number of proofs:

```
libraries(+list(atom),+list) - one
```

---

libraries/1

Creates XML documenting files for all entities in all given libraries using default options.

Compilation flags:

```
static
```

Template:

```
libraries(Libraries)
```

Mode and number of proofs:

```
libraries(+list(atom)) - one
```

---

library/2

Creates XML documenting files for all entities in a library using the specified options.

Compilation flags:

```
static
```

Template:

```
library(Library,Options)
```

Mode and number of proofs:

```
library(+atom,+list) - one
```

Examples:

Generate XML documenting files for all library entities for later conversion to PDF A4 files

```
library(library,[xslfile('logtalk_entity_to_pdf_a4.xsl')])
yes
```

---

library/1

Creates XML documenting files for all entities in a library using default options.

Compilation flags:

```
static
```

Template:

```
library(Library)
```

Mode and number of proofs:

```
library(+atom) - one
```

---

rdirectories/2

Creates XML documenting files for all entities in all given directories and their sub-directories using the specified options.

Compilation flags:

```
static
```

Template:

```
rdirectories(Directories,Options)
```

Mode and number of proofs:

```
rdirectories(+list(atom),+list) - one
```

---

rdirectories/1

Creates XML documenting files for all entities in all given directories and their sub-directories using default options.

Compilation flags:

```
static
```

Template:

```
rdirectories(Directories)
```

Mode and number of proofs:

```
rdirectories(+list(atom)) - one
```

---

rdirectory/2

Creates XML documenting files for all entities in a directory and its sub-directories using the specified options.

Compilation flags:
```
static
```

Template:
```
rdirectory(Directory,Options)
```
Mode and number of proofs:
```
rdirectory(+atom,+list) - one
```

Examples:

Generate XML documenting files for all entities in the tools directory for later conversion to Markdown files
```
rdirectory('./tools',[xslfile('lgtmd.xsl')])
yes
```

---

rdirectory/1

Creates XML documenting files for all entities in a directory and its sub-directories using default options.

Compilation flags:
```
static
```

Template:
```
rdirectory(Directory)
```
Mode and number of proofs:
```
rdirectory(+atom) - one
```

Examples:

Generate XML documenting files for all entities in the tools directory for direct viewing in a browser (after indexing using the `lgt2xml` script)
```
rdirectory('./tools')
yes
```

---

directories/2

Creates XML documenting files for all entities in all given directories using the specified options.

Compilation flags:
```
static
```

Template:
```
directories(Directories,Options)
```
Mode and number of proofs:

```
directories(+list(atom),+list) - one
```

---

directories/1

Creates XML documenting files for all entities in all given directories using default options.

Compilation flags:

```
static
```

Template:

```
directories(Directories)
```

Mode and number of proofs:

```
directories(+list(atom)) - one
```

---

directory/2

Creates XML documenting files for all entities in a directory using the specified options.

Compilation flags:

```
static
```

Template:

```
directory(Directory,Options)
```

Mode and number of proofs:

```
directory(+atom,+list) - one
```

Examples:

Generate XML documenting files for all the entities in the current directory for later conversion to PDF A4 files

```
directory('.',[xslfile('logtalk_entity_to_pdf_a4.xsl')])
yes
```

---

directory/1

Creates XML documenting files for all entities in a directory using default options.

Compilation flags:

```
static
```

Template:

```
directory(Directory)
```

Mode and number of proofs:

```
directory(+atom) - one
```

---

files/2

Creates XML documenting files for all entities in loaded source files using the specified options. The files can be given by name, basename, full path, or using library notation.

Compilation flags:

```
static
```

Template:

```
files(Files,Options)
```

Mode and number of proofs:

```
files(+list(atom),+list) - one
```

---

files/1

Creates XML documenting files for all entities in loaded source files using default options. The files can be given by name, basename, full path, or using library notation.

Compilation flags:

```
static
```

Template:

```
files(Files)
```

Mode and number of proofs:

```
files(+list(atom)) - one
```

---

file/2

Creates XML documenting files for all entities in a loaded source file using the specified options. The file can be given by name, basename, full path, or using library notation.

Compilation flags:

```
static
```

Template:

```
file(File,Options)
```

Mode and number of proofs:

```
file(+atom,+list) - one
```

---

file/1

Creates XML documenting files for all entities in a loaded source file using default options. The file can be given by name, basename, full path, or using library notation.

Compilation flags:
`static`

Template:
`file(File)`
Mode and number of proofs:
`file(+atom)` - `one`

---

all/1

Creates XML documenting files for all loaded entities using the specified options.

Compilation flags:
`static`

Template:
`all(Options)`
Mode and number of proofs:
`all(+list)` - `one`

---

all/0

Creates XML documenting files for all loaded entities using default options.

Compilation flags:
`static`

Mode and number of proofs:
`all` - `one`

Uses:
fast_random
list
logtalk
numberlist

os
term_io
type
user

Remarks:

- Usage: Define test objects as extensions of the `lgtunit` object and compile their source files using the compiler option `hook(lgtunit)`.
- Portability: Deterministic unit tests are currently not available when using Quintus Prolog as the backend compiler.
- Known issues: Parameter variables cannot currently be used in the definition of test options.

Inherited public predicates:

Public predicates

cover/1

Declares entities being tested for which code coverage information should be collected.

Compilation flags:
`static`

Template:
`cover(Entity)`
Mode and number of proofs:
`cover(?entity_identifier)` - `zero_or_more`

run/0

Runs the unit tests, writing the results to the current output stream.

Compilation flags:
`static`

Mode and number of proofs:
`run` - `one`

---

run/1

Runs a unit test or a list of unit tests, writing the results to the current output stream. Runs the global setup and cleanup steps when defined. Fails when given a partial list of tests or when one of the test identifiers is not valid.

Compilation flags:
`static`

Template:
`run(Tests)`
Mode and number of proofs:
`run(++callable)` - `zero_or_one`
`run(++list(callable))` - `zero_or_one`

---

run/2

Runs the unit tests, writing the results to the specified file. Mode can be either `write` (to create a new file) or `append` (to add results to an existing file).

Compilation flags:
`static`

Template:
`run(File,Mode)`
Mode and number of proofs:
`run(+atom,+atom)` - `one`

---

run_test_sets/1

Runs two or more test sets as a unified set generating a single code coverage report if one is requested. When there is a single test set, it is equivalent to sending the message `run/0` to the test set. Trivially succeeds when the argument is an empty list.

Compilation flags:
`static`

Template:
`run_test_sets(TestObjects)`
Mode and number of proofs:
`run_test_sets(+list(object))` - `one`

Exceptions:
`TestObjects` is a partial list or a list with an element which is a variable:
`instantiation_error`
`TestObjects` is neither a partial list nor a list:
`type_error(list(object),TestObjects)`
An element `TestObject` of the `TestObjects` list is not an existing object:
`existence_error(object,TestObject)`

---

test/1

Enumerates, by backtracking, the identifiers of all defined unit tests.

Compilation flags:
`static`

Template:
`test(Identifier)`
Mode and number of proofs:
`test(?callable)` - `zero_or_more`

---

number_of_tests/1

Number of defined unit tests.

Compilation flags:
`static`

Template:
`number_of_tests(NumerOfTests)`
Mode and number of proofs:
`number_of_tests(?integer)` - `zero_or_one`

---

deterministic/1

True if the goal succeeds once without leaving choice-points.

Compilation flags:
`static`

Template:
`deterministic(Goal)`
Meta-predicate template:
`deterministic(0)`
Mode and number of proofs:
`deterministic(+callable)` - `zero_or_one`

---

deterministic/2

Reified version of the `deterministic/1` predicate. True if the goal succeeds. Returns a boolean value (`true` or `false`) indicating if the goal succeeded without leaving choice-points.

Compilation flags:
`static`

Template:
`deterministic(Goal,Deterministic)`
Meta-predicate template:
`deterministic(0,*)`
Mode and number of proofs:
`deterministic(+callable,--atom)` - `zero_or_one`

---

assertion/1

True if the assertion goal succeeds. Throws an error using the assertion goal as argument if the assertion goal throws an error or fails.

Compilation flags:
`static`

Template:
`assertion(Assertion)`
Meta-predicate template:
`assertion(::)`
Mode and number of proofs:
`assertion(@callable)` - `one`

Exceptions:

Assertion goal fails:

```
assertion_failure(Assertion)
```

Assertion goal throws Error:

```
assertion_error(Assertion,Error)
```

---

assertion/2

True if the assertion goal succeeds. Throws an error using the description as argument if the assertion goal throws an error or fails. The description argument helps to distinguish between different assertions in the same test body.

Compilation flags:

```
static
```

Template:

```
assertion(Description,Assertion)
```

Meta-predicate template:

```
assertion(*,0)
```

Mode and number of proofs:

```
assertion(+nonvar,@callable) - one
```

Exceptions:

Assertion goal fails:

```
assertion_failure(Description)
```

Assertion goal throws Error:

```
assertion_error(Description,Error)
```

---

quick_check/3

Reified version of the `quick_check/2` predicate. Reports `passed(SequenceSeed,Discarded,Labels)`, `failed(Goal,SequenceSeed,TestSeed)`, `error(Error,Goal,SequenceSeed,TestSeed)`, or `broken(Why,Culprit)`. `Goal` is the failed test.

Compilation flags:

```
static
```

Template:

```
quick_check(Template,Result,Options)
```

Meta-predicate template:

```
quick_check(::,*,::)
```

Mode and number of proofs:

```
quick_check(@callable,-callable,++list(compound)) - one
```

Remarks:

- `SequenceSeed` argument: Can be used to re-run the same exact sequence of pseudo-random tests by using the `rs/1` option after changes to the code being tested.

- `TestSeed` argument: Can be used to re-run the test that failed by using the `rs/1` option after changes to the code being tested.
- `Discarded` argument: Number of generated tests that were discarded for failing to comply a pre-condition specified using the `pc/1` option.
- `Labels` argument: List of pairs `Label-N` where `N` is the number of generated tests that are classified as `Label` by a closure specified using the `l/1` option.
- `broken(Why,Culprit)` result: This result signals a broken setup. For example, an invalid template, a broken pre-condition or label goal, or broken test generation.

---

quick_check/2

Generates and runs random tests for a predicate given its mode template and a set of options. Fails when a generated test fails printing the test. Also fails on an invalid option, printing the option.

Compilation flags:

```
static
```

Template:

```
quick_check(Template,Options)
```

Meta-predicate template:

```
quick_check(::,::)
```

Mode and number of proofs:

```
quick_check(@callable,++list(compound)) - zero_or_one
```

Remarks:

- Number of tests: Use the `n(NumberOfTests)` option to specify the number of random tests. Default is 100.
- Maximum number of shrink operations: Use the `s(MaxShrinks)` option to specify the number of shrink operations when a counter example is found. Default is 64.
- Type edge cases: Use the `ec(Boolean)` option to specify if type edge cases are tested (before generating random tests). Default is `true`.
- Starting seed: Use the `rs(Seed)` option to specify the random generator starting seed to be used when generating tests. No default. Seeds should be regarded as opaque terms.
- Test generation filtering: Use the `pc/1` option to specify a pre-condition closure for filtering generated tests (extended with the test arguments; no default).
- Generated tests classification: Use the `l/1` option to specify a label closure for classifying the generated tests (extended with the test arguments plus the labels argument; no default). The labelling predicate can return a single test label or a list of test labels.
- Verbose test generation: Use the `v(Boolean)` option to specify verbose reporting of generated random tests. Default is `false`.
- Progress bar: Use the `pb(Boolean,Tick)` option to print a progress bar for the executed tests, advancing at every `Tick` tests. Default is `false`. Only applies when the verbose option is false.

---

quick_check/1

Generates and runs random tests using default options for a predicate given its mode template. Fails when a generated test fails printing the test.

Compilation flags:
`static`

Template:
`quick_check(Template)`
Mode and number of proofs:
`quick_check(@callable)` - `zero_or_one`

---

benchmark/2

Benchmarks a goal and returns the total execution time in seconds. Uses CPU clock. Goals that may throw an exception should be wrapped by the `catch/3` control construct.

Compilation flags:
`static`

Template:
`benchmark(Goal,Time)`
Meta-predicate template:
`benchmark(0,*)`
Mode and number of proofs:
`benchmark(+callable,-float)` - `one`

---

benchmark_reified/3

Benchmarks a goal and returns the total execution time in seconds plus its result (`success`, `failure`, or `error(Error)`). Uses CPU clock.

Compilation flags:
`static`

Template:
`benchmark_reified(Goal,Time,Result)`
Meta-predicate template:
`benchmark_reified(0,*,*)`
Mode and number of proofs:
`benchmark_reified(+callable,-float,-callable)` - `one`

---

benchmark/3

Benchmarks a goal by repeating it the specified number of times and returning the total execution time in seconds. Uses CPU clock. Goals that may throw an exception should be wrapped by the `catch/3` control construct.

Compilation flags:
`static`

Template:
`benchmark(Goal,Repetitions,Time)`
Meta-predicate template:
`benchmark(0,*,*)`
Mode and number of proofs:
`benchmark(@callable,+positive_integer,-float) - one`

---

benchmark/4

Benchmarks a goal by repeating it the specified number of times and returning the total execution time in seconds using the given clock (`cpu` or `wall`). Goals that may throw an exception should be wrapped by the `catch/3` control construct.

Compilation flags:
`static`

Template:
`benchmark(Goal,Repetitions,Clock,Time)`
Meta-predicate template:
`benchmark(0,*,*,*)`
Mode and number of proofs:
`benchmark(@callable,+positive_integer,+atom,-float) - one`

---

variant/2

True when the two arguments are a variant of each other. I.e. if is possible to rename the term variables to make them identical. Useful for checking expected test results that contain variables.

Compilation flags:
`static`

Template:
`variant(Term1,Term2)`
Mode and number of proofs:
`variant(@term,@term) - zero_or_one`

---

approximately_equal/2

Compares two numbers for approximate equality given the `epsilon` arithmetic constant value using the de facto standard formula `abs(Number1 - Number2) =< max(abs(Number1), abs(Number2)) * epsilon`. Type-checked.

Compilation flags:

`static`

Template:

`approximately_equal(Number1,Number2)`

Mode and number of proofs:

`approximately_equal(+number,+number)` - `zero_or_one`

---

approximately_equal/3

Compares two numbers for approximate equality given a user-defined epsilon value using the de facto standard formula `abs(Number1 - Number2) =< max(abs(Number1), abs(Number2)) * Epsilon`. Type-checked.

Compilation flags:

`static`

Template:

`approximately_equal(Number1,Number2,Epsilon)`

Mode and number of proofs:

`approximately_equal(+number,+number,+number)` - `zero_or_one`

Remarks:

- Epsilon range: Epsilon should be the `epsilon` arithmetic constant value or a small multiple of it. Only use a larger value if a greater error is expected.
- Comparison with essential equality: For the same epsilon value, approximate equality is weaker requirement than essential equality.

---

essentially_equal/3

Compares two numbers for essential equality given an epsilon value using the de facto standard formula `abs(Number1 - Number2) =< min(abs(Number1), abs(Number2)) * Epsilon`. Type-checked.

Compilation flags:

`static`

Template:

`essentially_equal(Number1,Number2,Epsilon)`

Mode and number of proofs:

`essentially_equal(+number,+number,+number)` - `zero_or_one`

Remarks:

- Comparison with approximate equality: For the same epsilon value, essential equality is a stronger requirement than approximate equality.

---

tolerance_equal/4

Compares two numbers for close equality given relative and absolute tolerances using the de facto standard formula `abs(Number1 - Number2) =< max(RelativeTolerance * max(abs(Number1), abs(Number2)), AbsoluteTolerance)`. Type-checked.

Compilation flags:

`static`

Template:

`tolerance_equal(Number1,Number2,RelativeTolerance,AbsoluteTolerance)`

Mode and number of proofs:

`tolerance_equal(+number,+number,+number,+number)` - `zero_or_one`

=~= / 2

Compares two numbers (or lists of numbers) for approximate equality using `100*epsilon` for the absolute error and, if that fails, `99.999%` accuracy for the relative error. But these precision values may not be adequate for all cases. Type-checked.

Compilation flags:

`static`

Template:

`=~=(Number1,Number2)`

Mode and number of proofs:

`=~=(+number,+number)` - `zero_or_one`

`=~=(+list(number),+list(number))` - `zero_or_one`

---

epsilon/1

Returns the value of epsilon used in the definition of the `(=~=)/2` predicate.

Compilation flags:

`static`

Template:

`epsilon(Epsilon)`

Mode and number of proofs:

`epsilon(-float)` - `one`

Protected predicates

run_tests/0

Runs all defined unit tests.

Compilation flags:
`static`

Mode and number of proofs:
`run_tests` - `one`

---

run_tests/1

Runs all the tests defined in the given file.

Compilation flags:
`static`

Template:
`run_tests(File)`
Mode and number of proofs:
`run_tests(+atom)` - `one`

---

run_test_set/0

Runs a test set as part of running two or more test sets as a unified set.

Compilation flags:
`static`

Mode and number of proofs:
`run_test_set` - `one`

---

run_quick_check_tests/5

Runs a QuickCheck test using the given options. Returns the starting seed used to generate the random tests, the number of discarded tests, and the test label statistics.

Compilation flags:
`static`

Template:

`run_quick_check_tests(Template,Options,Seed,Discarded,Labels)`

Meta-predicate template:

`run_quick_check_tests(::,::,*,*,*)`

Mode and number of proofs:

`run_quick_check_tests(@callable,+list,--nonvar,--number,--list(pair))` - `one_or_error`

Exceptions:

`Template` is a variable:

`quick_check_broken(template_error(Template),instantiation_error)`

`Template` is not a callable term:

`quick_check_broken(template_error(Template),type_error(callable,Template))`

An error is raised while checking a generated test pre-condition:

`quick_check_broken(pre_condition_error(Condition),Error)`

All generated tests fail the pre-condition:

`quick_check_broken(pre_condition_always_fails(Condition))`

An error is raised while evaluating a label goal:

`quick_check_broken(label_goal_error(Label),Error)`

A label goal fails:

`quick_check_broken(label_goal_failure(Label))`

An error is raised while generating test arguments:

`quick_check_broken(generate_test_error(Template),Error)`

Test argument generation fails:

`quick_check_broken(generate_test_failure(Template),Type)`

---

condition/0

Verifies conditions for running the tests. Defaults to the goal `true`.

Compilation flags:

`static`

Mode and number of proofs:

`condition` - `zero_or_one`

---

setup/0

Setup environment before running the test set. Defaults to the goal `true`.

Compilation flags:

`static`

Mode and number of proofs:

`setup` - `zero_or_one`

---

cleanup/0

Cleanup environment after running the test set. Defaults to the goal `true`.

Compilation flags:
`static`

Mode and number of proofs:
`cleanup` - `zero_or_one`

---

make/1

Make target for automatically running the test set when calling the `logtalk_make/1` built-in predicate. No default. Possible values are `all` and `check`.

Compilation flags:
`static`

Template:
`make(Target)`
Mode and number of proofs:
`make(?atom)` - `zero_or_one`

---

note/1

Note to be printed after the test results. Defaults to the empty atom.

Compilation flags:
`static`

Template:
`note(Note)`
Mode and number of proofs:
`note(?atom)` - `zero_or_one`

---

file_path/2

Returns the absolute path for a file path that is relative to the tests object path. When the file path is already an absolute path, it is expanded to resolve any remaining relative file path parts.

Compilation flags:
`static`

Template:

```
file_path(File,Path)
```

Mode and number of proofs:

```
file_path(+atom,-atom) - one
```

See also:

clean_file/1
clean_directory/1

---

file_url/2

Returns the URL for a file path that can be either absolute or relative to the tests object path. When the file path is an absolute path, it is expanded to resolve any remaining relative file path parts.

Compilation flags:

```
static
```

Template:

```
file_url(File,URL)
```

Mode and number of proofs:

```
file_url(+atom,-atom) - one
```

---

suppress_text_output/0

Suppresses text output. Useful to avoid irrelevant text output from predicates being tested to clutter the test logs.

Compilation flags:

```
static
```

Mode and number of proofs:

```
suppress_text_output - one
```

---

suppress_binary_output/0

Suppresses binary output. Useful to avoid irrelevant binary output from predicates being tested to clutter the test logs.

Compilation flags:

```
static
```

Mode and number of proofs:

```
suppress_binary_output - one
```

---

set_text_input/3

Creates a temporary file, in the same directory as the tests object, with the given text contents, and opens it for reading referenced by the given alias and using the additional options. If no `eof_action/1` option is specified, its value will be the default used by the backend compiler.

Compilation flags:

`static`

Template:

`set_text_input(Alias,Contents,Options)`

Mode and number of proofs:

`set_text_input(+atom,+atom,+list(stream_option))` - `one`

`set_text_input(+atom,+list(atom),+list(stream_option))` - `one`

See also:

text_input_assertion/3

check_text_input/2

clean_text_input/0

---

set_text_input/2

Creates a temporary file, in the same directory as the tests object, with the given text contents, and opens it for reading referenced by the given alias and using the default end-of-file action for the used backend compiler.

Compilation flags:

`static`

Template:

`set_text_input(Alias,Contents)`

Mode and number of proofs:

`set_text_input(+atom,+atom)` - `one`

`set_text_input(+atom,+list(atom))` - `one`

See also:

text_input_assertion/3

check_text_input/2

clean_text_input/0

---

set_text_input/1

Creates a temporary file, in the same directory as the tests object, with the given text contents, opens it for reading using the default end-of-file action for the used backend compiler, and sets the current input stream to the file.

Compilation flags:

```
static
```

Template:

```
set_text_input(Contents)
```

Mode and number of proofs:

```
set_text_input(+atom) - one
set_text_input(+list(atom)) - one
```

See also:

text_input_assertion/2
check_text_input/1
clean_text_input/0

---

check_text_input/2

Checks that the temporary file (referenced by the given alias) being read have the expected text contents.

Compilation flags:

```
static
```

Template:

```
check_text_input(Alias,Contents)
```

Mode and number of proofs:

```
check_text_input(+atom,+atom) - zero_or_one
```

See also:

set_text_input/2
set_text_input/2
text_input_assertion/3
clean_text_input/0

---

check_text_input/1

Checks that the temporary file being read have the expected text contents.

Compilation flags:

```
static
```

Template:

```
check_text_input(Contents)
```

Mode and number of proofs:

```
check_text_input(+atom) - zero_or_one
```

See also:

set_text_input/1
text_input_assertion/2
clean_text_input/0

---

text_input_assertion/3

Returns an assertion for checking that the temporary file (referenced by the given alias) being read have the expected text contents.

Compilation flags:

```
static
```

Template:

```
text_input_assertion(Alias,Contents,Assertion)
```

Mode and number of proofs:

```
text_input_assertion(+atom,+atom,--callable) - one
```

See also:

set_text_input/3
check_text_input/2
clean_text_input/0

---

text_input_assertion/2

Returns an assertion for checking that the temporary file being read have the expected text contents.

Compilation flags:

```
static
```

Template:

```
text_input_assertion(Contents,Assertion)
```

Mode and number of proofs:

```
text_input_assertion(+atom,--callable) - one
```

See also:

set_text_input/1
check_text_input/1
clean_text_input/0

---

clean_text_input/0

Cleans the temporary file used when testing text input.

Compilation flags:
`static`

Mode and number of proofs:
`clean_text_input` - `one`

See also:
set_text_input/3
set_text_input/2
set_text_input/1

---

set_binary_input/3

Creates a temporary file, in the same directory as the tests object, with the given binary contents, and opens it for reading referenced by the given alias and using the additional options. If no `eof_action/1` option is specified, its value will be the default used by the backend compiler.

Compilation flags:
`static`

Template:
`set_binary_input(Alias,Bytes,Options)`
Mode and number of proofs:
`set_binary_input(+atom,+list(byte),+list(stream_option))` - `one`

See also:
binary_input_assertion/3
check_binary_input/2
clean_binary_input/0

---

set_binary_input/2

Creates a temporary file, in the same directory as the tests object, with the given binary contents, and opens it for reading referenced by the given alias and using the default end-of-file action for the used backend compiler.

Compilation flags:
`static`

Template:
`set_binary_input(Alias,Bytes)`
Mode and number of proofs:

`set_binary_input(+atom,+list(byte))` - `one`

See also:

binary_input_assertion/3
check_binary_input/2
clean_binary_input/0

---

set_binary_input/1

Creates a temporary file, in the same directory as the tests object, with the given binary contents, and opens it for reading using the default end-of-file action for the used backend compiler, and sets the current input stream to the file.

Compilation flags:

`static`

Template:

`set_binary_input(Bytes)`

Mode and number of proofs:

`set_binary_input(+list(byte))` - `one`

See also:

binary_input_assertion/2
check_binary_input/1
clean_binary_input/0

---

check_binary_input/2

Checks that the temporary file (referenced by the given alias) being read have the expected binary contents.

Compilation flags:

`static`

Template:

`check_binary_input(Alias,Bytes)`

Mode and number of proofs:

`check_binary_input(+atom,+list(byte))` - `zero_or_one`

See also:

set_binary_input/3
set_binary_input/2
binary_input_assertion/3
clean_binary_input/0

---

check_binary_input/1

Checks that the temporary file being read have the expected binary contents.

Compilation flags:
`static`

Template:
`check_binary_input(Bytes)`
Mode and number of proofs:
`check_binary_input(+list(byte))` - `zero_or_one`

See also:
binary_input_assertion/2
set_binary_input/1
clean_binary_input/0

---

binary_input_assertion/3

Returns an assertion for checking that the temporary file (referenced by the given alias) being read have the expected binary contents.

Compilation flags:
`static`

Template:
`binary_input_assertion(Alias,Bytes,Assertion)`
Mode and number of proofs:
`binary_input_assertion(+atom,+list(byte),--callable)` - `one`

See also:
check_binary_input/2
set_binary_input/3
set_binary_input/2
clean_binary_input/0

---

binary_input_assertion/2

Returns an assertion for checking that the temporary file being read have the expected binary contents.

Compilation flags:
`static`

Template:
`binary_input_assertion(Bytes,Assertion)`
Mode and number of proofs:

`binary_input_assertion(+list(byte),--callable)` - `one`

See also:

check_binary_input/1
set_binary_input/1
clean_binary_input/0

---

clean_binary_input/0

Cleans the temporary file used when testing binary input.

Compilation flags:

`static`

Mode and number of proofs:

`clean_binary_input` - `one`

See also:

set_binary_input/3
set_binary_input/2
set_binary_input/1

---

set_text_output/3

Creates a temporary file, in the same directory as the tests object, with the given text contents, and opens it for writing referenced by the given alias and using the additional options.

Compilation flags:

`static`

Template:

`set_text_output(Alias,Contents,Options)`

Mode and number of proofs:

`set_text_output(+atom,+atom,+list(stream_option))` - `one`
`set_text_output(+atom,+list(atom),+list(stream_option))` - `one`

See also:

text_output_assertion/4
check_text_output/3
clean_text_output/0

---

set_text_output/2

Creates a temporary file, in the same directory as the tests object, with the given text contents, and referenced by the given alias.

Compilation flags:

```
static
```

Template:

```
set_text_output(Alias,Contents)
```

Mode and number of proofs:

```
set_text_output(+atom,+atom) - one
set_text_output(+atom,+list(atom)) - one
```

See also:

text_output_assertion/3
check_text_output/2
clean_text_output/0

---

set_text_output/1

Creates a temporary file, in the same directory as the tests object, with the given text contents, and sets the current output stream to the file.

Compilation flags:

```
static
```

Template:

```
set_text_output(Contents)
```

Mode and number of proofs:

```
set_text_output(+atom) - one
set_text_output(+list(atom)) - one
```

See also:

text_output_assertion/2
check_text_output/1
clean_text_output/0

---

check_text_output/3

Checks that the temporary file (open with the given options and alias in the same directory as the tests object) being written have the expected text contents.

Compilation flags:

```
static
```

Template:
`check_text_output(Alias,Contents,Options)`
Mode and number of proofs:
`check_text_output(+atom,+atom,+list(stream_option))` - `zero_or_one`

See also:
set_text_output/3
text_output_assertion/4
clean_text_output/0

---

check_text_output/2

Checks that the temporary file (open with default options and alias in the same directory as the tests object) being written have the expected text contents.

Compilation flags:
`static`

Template:
`check_text_output(Alias,Contents)`
Mode and number of proofs:
`check_text_output(+atom,+atom)` - `zero_or_one`

See also:
set_text_output/2
text_output_assertion/3
clean_text_output/0

---

check_text_output/1

Checks that the temporary file being written have the expected text contents.

Compilation flags:
`static`

Template:
`check_text_output(Contents)`
Mode and number of proofs:
`check_text_output(+atom)` - `zero_or_one`

See also:
set_text_output/1
text_output_assertion/2
clean_text_output/0

---

text_output_assertion/4

Returns an assertion for checking that the temporary file (open with the given options and alias in the same directory as the tests object) being written have the expected text contents.

Compilation flags:

```
static
```

Template:

```
text_output_assertion(Alias,Contents,Options,Assertion)
```

Mode and number of proofs:

```
text_output_assertion(+atom,+atom,+list(stream_option),--callable) - one
```

See also:

set_text_output/3
check_text_output/3
clean_text_output/0

---

text_output_assertion/3

Returns an assertion for checking that the temporary file (open with default options and alias in the same directory as the tests object) being written have the expected text contents.

Compilation flags:

```
static
```

Template:

```
text_output_assertion(Alias,Contents,Assertion)
```

Mode and number of proofs:

```
text_output_assertion(+atom,+atom,--callable) - one
```

See also:

set_text_output/2
check_text_output/2
clean_text_output/0

---

text_output_assertion/2

Returns an assertion for checking that the temporary file (open with default options in the same directory as the tests object) being written have the expected text contents.

Compilation flags:

```
static
```

Template:

```
text_output_assertion(Contents,Assertion)
```

Mode and number of proofs:

```
text_output_assertion(+atom,--callable) - one
```

See also:

set_text_output/1
check_text_output/1
clean_text_output/0

---

text_output_contents/3

Returns the contents of the temporary file (open with the given options and alias in the same directory as the tests object) being written.

Compilation flags:

```
static
```

Template:

```
text_output_contents(Alias,Contents,Options)
```

Mode and number of proofs:

```
text_output_contents(+atom,-list(character),+list(stream_option)) - one
```

---

text_output_contents/2

Returns the contents of the temporary file (open with default options and alias in the same directory as the tests object) being written.

Compilation flags:

```
static
```

Template:

```
text_output_contents(Alias,Contents)
```

Mode and number of proofs:

```
text_output_contents(+atom,-list(character)) - one
```

---

text_output_contents/1

Returns the contents of the temporary file (open with default options in the same directory as the tests object) being written.

Compilation flags:

```
static
```

Template:

```
text_output_contents(Contents)
```

Mode and number of proofs:

```
text_output_contents(-list(character)) - one
```

---

clean_text_output/0

Cleans the temporary file used when testing text output.

Compilation flags:

```
static
```

Mode and number of proofs:

```
clean_text_output - one
```

See also:

set_text_output/3
set_text_output/2
set_text_output/1

---

set_binary_output/3

Creates a temporary file, in the same directory as the tests object, with the given binary contents, and opens it for writing referenced by the given alias and using the additional options.

Compilation flags:

```
static
```

Template:

```
set_binary_output(Alias,Contents,Options)
```

Mode and number of proofs:

```
set_binary_output(+atom,+list(byte),+list(stream_option)) - one
```

See also:

binary_output_assertion/3
check_binary_output/2
clean_binary_output/0

---

set_binary_output/2

Creates a temporary file, in the same directory as the tests object, with the given binary contents, and opens it for writing referenced with the given alias.

Compilation flags:

```
static
```

Template:

```
set_binary_output(Alias,Bytes)
```

Mode and number of proofs:

```
set_binary_output(+atom,+list(byte)) - one
```

See also:

binary_output_assertion/3
check_binary_output/2
clean_binary_output/0

---

set_binary_output/1

Creates a temporary file, in the same directory as the tests object, with the given binary contents, and sets the current output stream to the file.

Compilation flags:

```
static
```

Template:

```
set_binary_output(Bytes)
```

Mode and number of proofs:

```
set_binary_output(+list(byte)) - one
```

See also:

binary_output_assertion/2
check_binary_output/1
clean_binary_output/0

---

check_binary_output/2

Checks that the temporary file (referenced by the given alias) have the expected binary contents.

Compilation flags:

```
static
```

Template:

```
check_binary_output(Alias,Bytes)
```

Mode and number of proofs:

`check_binary_output(+atom,+list(byte))` - `zero_or_one`

See also:

set_binary_output/3
set_binary_output/2
binary_output_assertion/3
clean_binary_output/0

---

check_binary_output/1

Checks that the temporary file (open in the same directory as the tests object) have the expected binary contents.

Compilation flags:

`static`

Template:

`check_binary_output(Bytes)`

Mode and number of proofs:

`check_binary_output(+list(byte))` - `zero_or_one`

See also:

set_binary_output/1
binary_output_assertion/2
clean_binary_output/0

---

binary_output_assertion/3

Returns an assertion for checking that the temporary file (referenced by the given alias) have the expected binary contents.

Compilation flags:

`static`

Template:

`binary_output_assertion(Alias,Bytes,Assertion)`

Mode and number of proofs:

`binary_output_assertion(+atom,+list(byte),--callable)` - `one`

See also:

set_binary_output/2
check_binary_output/2
clean_binary_output/0

---

binary_output_assertion/2

Returns an assertion for checking that the temporary file (open in the same directory as the tests object) have the expected binary contents.

Compilation flags:
`static`

Template:
`binary_output_assertion(Bytes,Assertion)`
Mode and number of proofs:
`binary_output_assertion(+list(byte),--callable)` - `one`

See also:
set_binary_output/1
check_binary_output/1
clean_binary_output/0

---

binary_output_contents/2

Returns the binary contents of the temporary file (referenced by the given alias) being written.

Compilation flags:
`static`

Template:
`binary_output_contents(Alias,Bytes)`
Mode and number of proofs:
`binary_output_contents(+atom,-list(byte))` - `one`

---

binary_output_contents/1

Returns the binary contents of the temporary file being written.

Compilation flags:
`static`

Template:
`binary_output_contents(Bytes)`
Mode and number of proofs:
`binary_output_contents(-list(byte))` - `one`

---

clean_binary_output/0

Cleans the temporary file used when testing binary output.

Compilation flags:

```
static
```

Mode and number of proofs:

```
clean_binary_output - one
```

See also:

set_binary_output/3
set_binary_output/2
set_binary_output/1

---

create_text_file/3

Creates a text file with the given contents. The file is open for writing using the given options. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:

```
static
```

Template:

```
create_text_file(File,Contents,Options)
```

Mode and number of proofs:

```
create_text_file(+atom,+atom,+list(stream_option)) - one
create_text_file(+atom,+list(atom),+list(stream_option)) - one
```

---

create_text_file/2

Creates a text file with the given contents. The file is open for writing using default options. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:

```
static
```

Template:

```
create_text_file(File,Contents)
```

Mode and number of proofs:

```
create_text_file(+atom,+atom) - one
create_text_file(+atom,+list(atom)) - one
```

---

create_binary_file/2

Creates a binary file with the given contents. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:
`static`

Template:
`create_binary_file(File,Bytes)`
Mode and number of proofs:
`create_binary_file(+atom,+list(byte))` - `one`

---

check_text_file/3

Checks that the contents of a text file match the expected contents. The file is open for reading using the given options. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:
`static`

Template:
`check_text_file(File,Contents,Options)`
Mode and number of proofs:
`check_text_file(+atom,+atom,+list(stream_option))` - `zero_or_one`

See also:
text_file_assertion/4

---

check_text_file/2

Checks that the contents of a text file (open for reading using default options) match the expected contents. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:
`static`

Template:
`check_text_file(File,Contents)`
Mode and number of proofs:
`check_text_file(+atom,+atom)` - `zero_or_one`

See also:
text_file_assertion/3

---

text_file_assertion/4

Returns an assertion for checking that the given file have the expected text contents. The file is open for reading using the given options. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:

```
static
```

Template:

```
text_file_assertion(File,Contents,Options,Assertion)
```

Mode and number of proofs:

```
text_file_assertion(+atom,+atom,+list(stream_option),--callable) - one
```

See also:

check_text_file/3

---

text_file_assertion/3

Returns an assertion for checking that the given file have the expected text contents. The file is open for reading using default options. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:

```
static
```

Template:

```
text_file_assertion(File,Contents,Assertion)
```

Mode and number of proofs:

```
text_file_assertion(+atom,+atom,--callable) - one
```

See also:

check_text_file/2

---

check_binary_file/2

Checks the contents of a binary file match the expected contents. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:

```
static
```

Template:

```
check_binary_file(File,Bytes)
```

Mode and number of proofs:

```
check_binary_file(+atom,+list(byte)) - zero_or_one
```

See also:

binary_file_assertion/3

---

binary_file_assertion/3

Returns an assertion for checking that the given file have the expected binary contents. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:
`static`

Template:
`binary_file_assertion(File,Bytes,Assertion)`
Mode and number of proofs:
`binary_file_assertion(+atom,+list(byte),--callable)` - `one`

See also:
check_binary_file/2

---

clean_file/1

Closes any existing stream associated with the file and deletes the file if it exists. Relative file paths are interpreted as relative to the tests object path.

Compilation flags:
`static`

Template:
`clean_file(File)`
Mode and number of proofs:
`clean_file(+atom)` - `one`

See also:
clean_directory/1
file_path/2

---

clean_directory/1

Deletes a directory if it exists. Relative directory paths are interpreted as relative to the tests object path.

Compilation flags:
`static`

Template:

```
clean_directory(Directory)
```

Mode and number of proofs:

```
clean_directory(+atom) - one
```

See also:

clean_file/1
file_path/2

---

closed_input_stream/2

Opens a temporary file in the same directory as the tests object with the given options for reading, closes it, and returns its stream handle.

Compilation flags:

```
static
```

Template:

```
closed_input_stream(Stream,Options)
```

Mode and number of proofs:

```
closed_input_stream(-stream,+list(stream_option)) - one
```

---

closed_output_stream/2

Opens a temporary file in the same directory as the tests object with the given options for writing, closes it, and returns its stream handle.

Compilation flags:

```
static
```

Template:

```
closed_output_stream(Stream,Options)
```

Mode and number of proofs:

```
closed_output_stream(-stream,+list(stream_option)) - zero_or_one
```

---

stream_position/1

Returns a syntactically valid stream position by opening a temporary file in the same directory as the tests object.

Compilation flags:

```
static
```

Template:

```
stream_position(Position)
```

Mode and number of proofs:

```
stream_position(-stream_position) - one
```

---

test/2

Table of defined tests.

Compilation flags:

```
static
```

Template:

```
test(Identifier,Test)
```

Mode and number of proofs:

```
test(?callable,?compound) - zero_or_more
```

Private predicates

running_test_sets_/0

Internal flag used when running two or more test sets as a unified set.

Compilation flags:

```
dynamic
```

Mode and number of proofs:

```
running_test_sets_ - zero_or_one
```

---

test/3

Compiled unit tests. The list of variables is used to ensure variable sharing between a test with its test options.

Compilation flags:

```
static
```

Template:

```
test(Identifier,Variables,Outcome)
```

Mode and number of proofs:

```
test(?callable,?list(variable),?nonvar) - zero_or_more
```

---

test_time_/3

Test identifiers, objects, and wall times for the current test run.

Compilation flags:
```
dynamic
```

Template:
```
test_time_(Test,Object,WallTime)
```
Mode and number of proofs:
```
test_time_(?callable,?object,?float) - zero_or_more
```

---

auxiliary_predicate_counter_/1

Counter for generating unique auxiliary predicate names.

Compilation flags:
```
dynamic
```

Template:
```
auxiliary_predicate_counter_(Counter)
```
Mode and number of proofs:
```
auxiliary_predicate_counter_(?integer) - one_or_more
```

---

test_/2

Table of compiled tests.

Compilation flags:
```
dynamic
```

Template:
```
test_(Identifier,Test)
```
Mode and number of proofs:
```
test_(?callable,?compound) - zero_or_more
```

---

selected_test_/1

Table of selected tests for execution.

Compilation flags:
dynamic

Template:
selected_test_(Identifier)
Mode and number of proofs:
selected_test_(?callable) - zero_or_more

---

linter_warning_sequence_/1

Counter for cached test-compilation linter warnings.

Compilation flags:
dynamic

Template:
linter_warning_sequence_(Sequence)
Mode and number of proofs:
linter_warning_sequence_(?integer) - zero_or_one

---

recorded_linter_warning_/7

Cache of test-compilation linter warnings.

Compilation flags:
dynamic

Template:
recorded_linter_warning_(Sequence,RuleId,Message,Context,File,Lines,Properties)
Mode and number of proofs:
recorded_linter_warning_(?integer,?atom,?atom,?compound,?atom,?compound,?list(compound)) - zero_or_more

---

skipped_/1

Counter for skipped tests.

Compilation flags:
`dynamic`

Template:
`skipped_(Counter)`
Mode and number of proofs:
`skipped_(?integer)` - `zero_or_one`

---

passed_/3

Counter and total time for passed tests.

Compilation flags:
`dynamic`

Template:
`passed_(Counter,CPUTime,WallTime)`
Mode and number of proofs:
`passed_(?integer,-float,-float)` - `zero_or_one`

---

failed_/3

Counter and total time for failed tests.

Compilation flags:
`dynamic`

Template:
`failed_(Counter,CPUTime,WallTime)`
Mode and number of proofs:
`failed_(?integer,-float,-float)` - `zero_or_one`

---

flaky_/1

Counter for failed tests that are marked as flaky.

Compilation flags:
`dynamic`

Template:
`flaky_(Counter)`
Mode and number of proofs:
`flaky_(?integer)` - `zero_or_one`

---

fired_/3

Fired clauses when running the unit tests.

Compilation flags:
`dynamic`

Template:
`fired_(Entity,Predicate,Clause)`
Mode and number of proofs:
`fired_(?entity_identifier,?predicate_indicator,?integer)` - `zero_or_more`

---

covered_/4

Auxiliary predicate for collecting statistics on clause coverage.

Compilation flags:
`dynamic`

Template:
`covered_(Entity,Predicate,Covered,Total)`
Mode and number of proofs:
`covered_(?entity_identifier,?callable,?integer,?integer)` - `zero_or_more`

Operators

`op(700,xfx,=~=)`

Scope:
public

category

1.198.8 `lgtunit_messages`

Logtalk unit test framework default message translations.

Availability:
`logtalk_load(lgtunit(loader))`

Author: Paulo Moura
Version: 12:5:0
Date: 2026-11-17

Compilation flags:
static

Provides:
logtalk::message_prefix_stream/4
logtalk::message_tokens//2

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *failed_test_reason//1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

`failed_test_reason//1`

Used to rewrite a term representing the reason why a term failed into a list of tokens.

Compilation flags:
static

Template:

```
failed_test_reason(Reason)
```

Mode and number of proofs:

```
failed_test_reason(@nonvar) - one_or_more
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

object

1.198.9 `minimal_output`

Intercepts unit test execution messages and outputs a minimal report.

Availability:

```
logtalk_load(lgtunit(loader))
```

Author: Paulo Moura
Version: 3:0:0
Date: 2021-05-27

Compilation flags:

```
static, context_switching_calls
```

Provides:

logtalk::message_hook/4

Remarks:

- Usage: Simply load this object before running your tests using the goal `logtalk_load(lgtunit(minimal_output))`.
- Limitations: Cannot be used when the test objects also intercept `lgtunit` messages.

Inherited public predicates:

(none)

- *Public predicates*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

object

1.198.10 `sonar_report`

Intercepts unit test execution messages and generates a `sonar.xml` file with code coverage results using the SonarQube and SonarCloud Generic Test Coverage XML format.

Availability:

`logtalk_load(lgtunit(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-18

Compilation flags:

`static, context_switching_calls`

Provides:

logtalk::message_hook/4

Uses:

logtalk
user

Remarks:

- Usage: Simply load this object before running your tests using the goal `logtalk_load(lgtunit(sonar_report))`.
- Analysis parameter: Pass the generated report to the Sonar scanner using the `sonar.coverageReportPaths` analysis parameter.
- File paths: Sonar requires file paths to be either absolute or relative to the project root. Use the `suppress_path_prefix` flag to strip the prefix of the source file paths when necessary.
- Lines to cover: Each predicate is reported as a single line to cover, the line of its first clause. The line is reported as covered when at least one of the predicate clauses is covered. Predicates without line information and with lines outside the source file are not reported.
- Branches to cover: Predicates with two or more clauses also report the number of clauses as the number of branches to cover and the number of covered clauses as the number of covered branches.
- Shared lines and files: Entities defined in the same source file are reported under a single file element. Predicates that share the same line are reported as a single line to cover.

Inherited public predicates:
(none)

- *Public predicates*
- *Protected predicates*
- *Private predicates*
  - *predicate_coverage_/4*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

predicate_coverage_/4

Table of predicate coverage data.

Compilation flags:
`dynamic`

Template:
`predicate_coverage_(File,Line,Covered,Total)`
Mode and number of proofs:
`predicate_coverage_(?atom,?integer,?integer,?integer)` - `zero_or_more`

Operators

  - *op(100,xfx,<=)*
  - *op(100,xfx,=>)*

Public predicates

`new/1`

Makes `Variable` a stream variable. Initial state will be empty.

Compilation flags:
`static`

Template:

```
new(Variable)
```

Mode and number of proofs:

```
new(--streamvar) - one
```

Exceptions:

Variable is not a variable:

```
type_error(variable,Variable)
```

---

new/2

Makes `Variable` a stream variable and sets its initial state to `Value`.

Compilation flags:

```
static
```

Template:

```
new(Variable,Value)
```

Mode and number of proofs:

```
new(--streamvar,@nonvar) - one
```

Exceptions:

Variable is not a variable:

```
type_error(variable,Variable)
```

(<=)/2

Sets the state of the stream variable `Variable` to `Value` (initializing the variable if needed).

Compilation flags:

```
static
```

Template:

```
Variable<=Value
```

Mode and number of proofs:

```
(?streamvar)<=(@nonvar) - one
```

`(=>)/2`

Unifies `Value` with the current state of the stream variable `Variable`.

Compilation flags:
`static`

Template:
`Variable=>Value`
Mode and number of proofs:
`+streamvar=> ?nonvar - zero_or_one`

Protected predicates

1.200 linda

object

1.200.1 `linda`

Linda tuple-space implementation for process communication. Provides a server that acts as a shared blackboard where clients can write (`out/1-2`), read (`rd/1-2`), and remove (`in/1-2`) tuples. Uses threaded engines for the server implementation and the sockets library for network communication.

Availability:
`logtalk_load(linda(loader))`

Author: Paulo Moura
Version: 2:0:0
Date: 2026-03-27

Compilation flags:

`static, context_switching_calls, threaded`

Imports:

`public` *linda_server*
`public` *linda_client*

Remarks:

- Supported backends: SWI-Prolog, Trealla Prolog, and XVM (requires both multi-threading and sockets support).
- Linda operations: The basic operations are `out/1-2` (write tuple), `in/1-2` (remove tuple, blocking), `rd/1-2` (read tuple, blocking), `in_noblock/1-2` (remove tuple, non-blocking), and `rd_noblock/1-2` (read tuple, non-blocking).
- Tuple matching: Tuples are matched using unification.
- Blocking behavior: The `in/1-2` and `rd/1-2` predicates block until a matching tuple is available. The `in_noblock/1-2` and `rd_noblock/1-2` predicates fail immediately if no matching tuple is found.
- Multiple clients: Multiple clients can connect to the same server. A tuple removed by the `in/1-2` or `in_noblock/1-2` predicates is only removed for one client.
- Multiple servers: A client can connect to multiple servers. The first server it connects to, uses by default the `blackboard` alias.
- API compatibility: The API is inspired by the SICStus Prolog Linda library.
- Network communication: Uses TCP sockets for client-server communication, allowing processes to run on different machines.

Inherited public predicates:

check_option/1 check_options/1 close_client/1 default_option/1 default_options/1 findall_in_noblock/3 findall_in_noblock/4 findall_rd_noblock/3 findall_rd_noblock/4 in/1 in/2 in_list/2 in_list/3 in_noblock/1 in_noblock/2 linda/0 linda/1 linda_client/1 linda_client/2 linda_timeout/2 option/2 option/3 out/1 out/2 rd/1 rd/2 rd_list/2 rd_list/3 rd_noblock/1 rd_noblock/2 shutdown_server/1 valid_option/1 valid_options/1

    - *Operators*

Public predicates

`linda_client/2`

Connects to a Linda server at the given address (`Host:Port`) using the given options.

Compilation flags:
`static`

Template:
`linda_client(Address,Options)`

Mode and number of proofs:
`linda_client(++address,++list(compound))` - `one_or_error`

Exceptions:
Already connected:
`linda_error(already_connected)`
Connection failed:
`linda_error(connection_failed(Error))`

Remarks:

- Option `alias(Alias)`: Use `Alias` as an alias to the server address. Default is `blackboard`.

linda_client/1

Connects to a Linda server at the given address (`Host:Port`) using default options.

Compilation flags:
`static`

Template:
`linda_client(Address)`
Mode and number of proofs:
`linda_client(++address)` - `one_or_error`

Exceptions:
Already connected:
`linda_error(already_connected)`
Connection failed:
`linda_error(connection_failed(Error))`

---

close_client/1

Closes the connection to the given Linda server.

Compilation flags:
`static`

Template:
`close_client(Address)`
Mode and number of proofs:
`close_client(++address_or_alias)` - `one`

---

shutdown_server/1

Sends a shutdown signal to the given server. The server stops accepting new connections but continues serving existing clients until they all disconnect. The connection used for shutdown is closed after the server acknowledges the request.

Compilation flags:
`static`

Template:
`shutdown_server(Address)`
Mode and number of proofs:
`shutdown_server(++address_or_alias)` - `one_or_error`

Exceptions:
Not connected:

```
linda_error(not_connected(Address))
```

---

linda_timeout/2

Gets or sets the client timeout. `OldTime` is unified with the current timeout and the timeout is set to `NewTime`. The timeout value is either `off` (no timeout, wait forever) or `Seconds:Milliseconds`.

Compilation flags:

```
static
```

Template:

```
linda_timeout(OldTime,NewTime)
```

Mode and number of proofs:

```
linda_timeout(?compound,+compound) - one
```

---

out/2

Places the tuple `Tuple` in the tuple-space of the given server.

Compilation flags:

```
static
```

Template:

```
out(AddressOrALias,Tuple)
```

Mode and number of proofs:

```
out(++address_or_alias,+term) - one
```

---

out/1

Places the tuple `Tuple` in the tuple-space of the default server.

Compilation flags:

```
static
```

Template:

```
out(Tuple)
```

Mode and number of proofs:

```
out(+term) - one
```

---

in/2

Removes a tuple matching `Tuple` from the tuple-space of the given server. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`in(AddressOrALias,Tuple)`
Mode and number of proofs:
`in(++address_or_alias,?term) - one`

---

in/1

Removes a tuple matching `Tuple` from the tuple-space of the default server. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`in(Tuple)`
Mode and number of proofs:
`in(?term) - one`

---

in_noblock/2

Removes a tuple matching `Tuple` from the tuple-space of the default server. Fails if no matching tuple is available.

Compilation flags:
`static`

Template:
`in_noblock(AddressOrALias,Tuple)`
Mode and number of proofs:
`in_noblock(++address_or_alias,?term) - zero_or_one`

---

in_noblock/1

Removes a tuple matching `Tuple` from the tuple-space of the default server. Fails if no matching tuple is available.

Compilation flags:
`static`

Template:
`in_noblock(Tuple)`
Mode and number of proofs:
`in_noblock(?term)` - `zero_or_one`

---

in_list/3

Removes a tuple matching one of the patterns in `TupleList` from the tuple-space of the given server. `Tuple` is unified with the matched tuple. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`in_list(AddressOrALias,TupleList,Tuple)`
Mode and number of proofs:
`in_list(++address_or_alias,+list,?term)` - `one`

---

in_list/2

Removes a tuple matching one of the patterns in `TupleList` from the tuple-space of the default server. `Tuple` is unified with the matched tuple. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`in_list(TupleList,Tuple)`
Mode and number of proofs:
`in_list(+list,?term)` - `one`

---

rd/2

Reads a tuple matching `Tuple` from the tuple-space of the given server without removing it. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`rd(AddressOrALias,Tuple)`
Mode and number of proofs:
`rd(++address_or_alias,?term)` - `one`

---

rd/1

Reads a tuple matching `Tuple` from the tuple-space of the default server without removing it. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`rd(Tuple)`
Mode and number of proofs:
`rd(?term)` - `one`

---

rd_noblock/2

Reads a tuple matching `Tuple` from the tuple-space of the given server without removing it. Fails if no matching tuple is available.

Compilation flags:
`static`

Template:
`rd_noblock(AddressOrALias,Tuple)`
Mode and number of proofs:
`rd_noblock(++address_or_alias,?term)` - `zero_or_one`

---

rd_noblock/1

Reads a tuple matching `Tuple` from the tuple-space of the default server without removing it. Fails if no matching tuple is available.

Compilation flags:
`static`

Template:
`rd_noblock(Tuple)`
Mode and number of proofs:
`rd_noblock(?term)` - `zero_or_one`

---

rd_list/3

Reads a tuple matching one of the patterns in `TupleList` from the tuple-space of the given server without removing it. `Tuple` is unified with the matched tuple. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`rd_list(AddressOrALias,TupleList,Tuple)`
Mode and number of proofs:
`rd_list(++address_or_alias,+list,?term)` - `one`

---

rd_list/2

Reads a tuple matching one of the patterns in `TupleList` from the tuple-space of the default server without removing it. `Tuple` is unified with the matched tuple. Blocks if no matching tuple is available.

Compilation flags:
`static`

Template:
`rd_list(TupleList,Tuple)`
Mode and number of proofs:
`rd_list(+list,?term)` - `one`

---

findall_rd_noblock/4

Returns a list of all instances of `Template` for tuples matching `Tuple` in the tuple-space. The operation is atomic.

Compilation flags:
`static`

Template:
`findall_rd_noblock(AddressOrALias,Template,Tuple,List)`
Mode and number of proofs:
`findall_rd_noblock(++address_or_alias,?term,+term,?list) - one`

---

findall_rd_noblock/3

Returns a list of all instances of `Template` for tuples matching `Tuple` in the tuple-space. The operation is atomic.

Compilation flags:
`static`

Template:
`findall_rd_noblock(Template,Tuple,List)`
Mode and number of proofs:
`findall_rd_noblock(?term,+term,?list) - one`

---

findall_in_noblock/4

Removes and returns a list of all instances of `Template` for tuples matching `Tuple` in the tuple-space. The operation is atomic - all matching tuples are removed in one synchronized operation.

Compilation flags:
`static`

Template:
`findall_in_noblock(AddressOrALias,Template,Tuple,List)`
Mode and number of proofs:
`findall_in_noblock(++address_or_alias,?term,+term,?list) - one`

---

findall_in_noblock/3

Removes and returns a list of all instances of `Template` for tuples matching `Tuple` in the tuple-space. The operation is atomic - all matching tuples are removed in one synchronized operation.

Compilation flags:

```
static
```

Template:

```
findall_in_noblock(Template,Tuple,List)
```

Mode and number of proofs:

```
findall_in_noblock(?term,+term,?list) - one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

client_connection_input_/2

Stores the input stream for the client connection to the server.

Compilation flags:

```
dynamic
```

Template:

```
client_connection_input_(Address,InputStream)
```

Mode and number of proofs:

```
client_connection_input_(?address,?stream) - zero_or_more
```

---

client_connection_output_/2

Stores the output stream for the client connection to the server.

Compilation flags:

```
dynamic
```

Template:

```
client_connection_output_(Address,OutputStream)
```

Mode and number of proofs:

```
client_connection_output_(?address,?stream) - zero_or_more
```

---

client_connection_alias_/2

Stores the client connection server aliases.

Compilation flags:
`dynamic`

Template:
`client_connection_alias_(Address,Alias)`
Mode and number of proofs:
`client_connection_alias_(?address,?atom)` - `zero_or_more`

---

client_timeout_/1

Stores the timeout value for blocking client operations. Value is either `off` or `Seconds:Milliseconds`.

Compilation flags:
`dynamic`

Template:
`client_timeout_(Timeout)`
Mode and number of proofs:
`client_timeout_(?compound)` - `zero_or_one`

1.200.3 linda_server

Linda server predicates and tuple-space state. Import into a threaded object together with the linda_client category.

Availability:
`logtalk_load(linda(loader))`

Author: Paulo Moura
Version: 2:0:4
Date: 2026-07-14

Compilation flags:
`static`

Provides:
logtalk::message_prefix_stream/4

Uses:

list
logtalk
os
socket

Remarks:

(none)

Inherited public predicates:

Public predicates

`linda/1`

Starts a Linda server with the given options. The predicate succeeds when all clients have disconnected after a shutdown request.

Compilation flags:

`static`

Template:

`linda(Options)`

Meta-predicate template:

`linda(::)`

Mode and number of proofs:

`linda(+list)` - `one`

Remarks:

- Option `port(Port)`: Use `Port` as the server port. Must be an integer and an available port.
- Option `Address-Goal`: `Address` is unified with `Host:Port` and `Goal` is called when the server starts. Useful for saving the address or starting clients.
- Option `accept_hook(Client,Input,Output,Goal)`: When a client connects, `Client` is unified with the client address, `Input` and `Output` with the connection streams, and `Goal` is called. If `Goal` fails, the connection is rejected.

`linda/0`

Starts a Linda server on an automatically assigned port using default options. The server address (`Host:Port`) is written to the current output stream. The predicate succeeds when all clients have disconnected after a shutdown request.

Compilation flags:

`static`

Mode and number of proofs:

`linda` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

`server_socket_/1`

Stores the server socket descriptor.

Compilation flags:

`dynamic`

Template:

`server_socket_(ServerSocket)`

Mode and number of proofs:

`server_socket_(?term)` - `zero_or_one`

---

client_connection_/3

Stores active client connections. Each client has an ID, input stream, and output stream.

Compilation flags:
`dynamic`

Template:
`client_connection_(ClientId,InputStream,OutputStream)`
Mode and number of proofs:
`client_connection_(?term,?term,?term)` - `zero_or_more`

---

accept_hook_/1

Stores the optional accept hook goal to call when a client connects.

Compilation flags:
`dynamic`

Template:
`accept_hook_(Hook)`
Mode and number of proofs:
`accept_hook_(?callable)` - `zero_or_one`

---

server_running_/1

Flag indicating the server is running.

Compilation flags:
`dynamic`

Template:
`server_running_(Address)`
Mode and number of proofs:
`server_running_(?address)` - `zero_or_one`

---

server_shutdown_/0

Flag indicating the server has received a shutdown request.

Compilation flags:
`dynamic`

Mode and number of proofs:
`server_shutdown_` - `zero_or_one`

---

accept_loop_stopped_/0

Flag indicating the server accept loop has stopped.

Compilation flags:
`dynamic`

Mode and number of proofs:
`accept_loop_stopped_` - `zero_or_one`

---

tuple_/1

Stores tuples in the Linda tuple space.

Compilation flags:
`dynamic`

Template:
`tuple_(Tuple)`
Mode and number of proofs:
`tuple_(?term)` - `zero_or_more`

---

waiting_/3

Stores blocked clients waiting for tuples. Records the client ID, request pattern, and output stream.

Compilation flags:
`dynamic`

Template:
`waiting_(ClientId,Request,OutputStream)`
Mode and number of proofs:
`waiting_(?term,?term,?term)` - `zero_or_more`

---

client_engine_/2

Maps client IDs to their corresponding threaded engine names.

Compilation flags:
```
dynamic
```

Template:
```
client_engine_(ClientId,EngineName)
```
Mode and number of proofs:
```
client_engine_(?term,?atom) - zero_or_more
```

---

ts_out/1

Synchronized predicate to add a tuple to the tuple space and wake waiting clients.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_out(Tuple)
```
Mode and number of proofs:
```
ts_out(+term) - one
```

---

ts_in/4

Synchronized predicate to remove a matching tuple or register a waiting client.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_in(Tuple,ClientId,OutputStream,Found)
```
Mode and number of proofs:
```
ts_in(+term,+term,+term,-compound) - one
```

---

ts_in_noblock/2

Synchronized predicate to try removing a matching tuple without blocking.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_in_noblock(Tuple,Found)
```
Mode and number of proofs:
```
ts_in_noblock(+term,-compound) - zero_or_one
```

---

ts_in_list/4

Synchronized predicate to remove a tuple matching one of multiple patterns or register a waiting client.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_in_list(TupleList,ClientId,OutputStream,Found)
```
Mode and number of proofs:
```
ts_in_list(+list,+term,+term,-compound) - one
```

---

ts_rd/4

Synchronized predicate to read a matching tuple or register a waiting client.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_rd(Tuple,ClientId,OutputStream,Found)
```
Mode and number of proofs:
```
ts_rd(+term,+term,+term,-compound) - one
```

---

ts_rd_noblock/2

Synchronized predicate to try reading a matching tuple without blocking.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_rd_noblock(Tuple,Found)
```
Mode and number of proofs:
```
ts_rd_noblock(+term,-compound) - zero_or_one
```

---

ts_rd_list/4

Synchronized predicate to read a tuple matching one of multiple patterns or register a waiting client.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_rd_list(TupleList,ClientId,OutputStream,Found)
```
Mode and number of proofs:
```
ts_rd_list(+list,+term,+term,-compound) - one
```

---

ts_findall_rd_noblock/3

Synchronized predicate to collect all tuples matching a pattern.

Compilation flags:
```
static, synchronized
```

Template:
```
ts_findall_rd_noblock(Template,Tuple,List)
```
Mode and number of proofs:
```
ts_findall_rd_noblock(+term,+term,-list) - zero_or_more
```

---

ts_findall_in_noblock/3

Synchronized predicate to collect and remove all tuples matching a pattern.

Compilation flags:
`static, synchronized`

Template:
`ts_findall_in_noblock(Template,Tuple,List)`
Mode and number of proofs:
`ts_findall_in_noblock(+term,+term,-list)` - `zero_or_more`

(none)

1.201 linear_algebra

object

1.201.1 linear_algebra

Linear algebra predicates for numeric vectors and matrices implemented without dependencies on machine learning libraries.

Availability:
`logtalk_load(linear_algebra(loader))`

Author: Paulo Moura
Version: 2:2:0
Date: 2026-10-21

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *linear_algebra_protocol*
Uses:
list
numberlist
type

Remarks:
(none)

Inherited public predicates:

Public predicates

new_vector/3

Constructs a numeric vector with the requested length, filled with the given value.

Compilation flags:
`static`

Template:
`new_vector(Count,Value,Vector)`
Mode and number of proofs:
`new_vector(+integer,+number,-list(number))` - `one`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Value` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Count` is an integer that is less than zero:
`domain_error(non_negative_integer,Count)`

---

new_vector_like/2

Constructs a numeric zero vector matching the length of the reference list.

Compilation flags:
`static`

Template:
`new_vector_like(Reference,Zeroes)`
Mode and number of proofs:
`new_vector_like(+list,-list(number))` - `one`

---

add_vectors/3

Adds two numeric vectors element-wise.

Compilation flags:
`static`

Template:
`add_vectors(Vector1,Vector2,Vector)`
Mode and number of proofs:
`add_vectors(+list(number),+list(number),-list(number))` - `one`

---

subtract_vectors/3

Subtracts the second numeric vector from the first element-wise.

Compilation flags:
`static`

Template:
`subtract_vectors(Vector1,Vector2,Vector)`
Mode and number of proofs:
`subtract_vectors(+list(number),+list(number),-list(number))` - `one`

---

add_scaled_vector/4

Adds a scaled numeric vector to another numeric vector.

Compilation flags:
`static`

Template:
`add_scaled_vector(Vector,Scale,Vector0,UpdatedVector)`
Mode and number of proofs:
`add_scaled_vector(+list(number),+number,+list(number),-list(number))` - `one`

Exceptions:
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`

---

scale_vector/3

Scales a numeric vector by the given factor.

Compilation flags:
`static`

Template:
`scale_vector(Vector,Scale,ScaledVector)`
Mode and number of proofs:
`scale_vector(+list(number),+number,-list(number))` - `one`

Exceptions:
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`

---

dot_product/3

Computes the dot product of two numeric vectors of the same length. Returns the floating-point identity 0.0 for two empty vectors. Fails when the vectors have different lengths.

Compilation flags:
`static`

Template:
`dot_product(Vector1,Vector2,Product)`
Mode and number of proofs:
`dot_product(+list(number),+list(number),-number)` - `zero_or_one`

---

euclidean_norm/2

Computes the Euclidean norm of a numeric vector. Returns the floating-point identity 0.0 for an empty vector.

Compilation flags:
`static`

Template:
`euclidean_norm(Vector,Norm)`
Mode and number of proofs:
`euclidean_norm(+list(number),-float)` - `one`

---

vector_norm/3

Computes the norm of a numeric vector for a positive numeric order or the atoms *inf* and *infinity*. Returns the floating-point identity 0.0 for an empty vector and a valid order.

Compilation flags:
`static`

Template:
`vector_norm(Vector,Order,Norm)`
Mode and number of proofs:
`vector_norm(+list(number),@term,-number)` - `one_or_error`

Exceptions:
`Order` is a variable:
`instantiation_error`
`Order` is neither a variable, a number, nor one of the atoms `inf` and `infinity`:
`type_error(number,Order)`
`Order` is a number but not a valid positive_number_or_infinity:
`domain_error(positive_number_or_infinity,Order)`

---

basis_vector/3

Constructs a numeric basis vector with value 1.0 at the given one-based index and 0.0 elsewhere.

Compilation flags:
`static`

Template:
`basis_vector(Size,Index,Vector)`
Mode and number of proofs:
`basis_vector(+integer,+integer,-list(number))` - `one`

Exceptions:
`Size` is a variable:
`instantiation_error`
`Index` is a variable:
`instantiation_error`
`Size` is neither a variable nor an integer:
`type_error(integer,Size)`
`Index` is neither a variable nor an integer:
`type_error(integer,Index)`
`Size` is an integer that is less than one:
`domain_error(positive_integer,Size)`
`Index` is an integer that is less than one:
`domain_error(positive_integer,Index)`

---

new_matrix/4

Constructs a numeric matrix with the requested row and column counts, filled with the given value.

Compilation flags:
`static`

Template:
`new_matrix(Rows,Columns,Value,Matrix)`
Mode and number of proofs:
`new_matrix(+integer,+integer,+number,-list(list(number)))` - `one`

Exceptions:
`Rows` is a variable:
`instantiation_error`
`Columns` is a variable:
`instantiation_error`
`Value` is a variable:
`instantiation_error`
`Rows` is neither a variable nor an integer:
`type_error(integer,Rows)`
`Columns` is neither a variable nor an integer:
`type_error(integer,Columns)`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Rows` is an integer that is less than zero:
`domain_error(non_negative_integer,Rows)`
`Columns` is an integer that is less than zero:
`domain_error(non_negative_integer,Columns)`

---

identity_matrix/2

Constructs a square identity matrix with the requested size.

Compilation flags:
`static`

Template:
`identity_matrix(Size,Matrix)`
Mode and number of proofs:
`identity_matrix(+integer,-list(list(number)))` - `one`

Exceptions:
`Size` is a variable:
`instantiation_error`
`Size` is neither a variable nor an integer:
`type_error(integer,Size)`

`Size` is an integer that is less than zero:
`domain_error(non_negative_integer,Size)`

---

matrix_vector_product/3

Computes the matrix-vector product for a numeric matrix and vector, returning the list of row-wise dot products between each matrix row and the vector. Zero-width rows multiplied by an empty vector produce 0.0 values. Fails when a row and the vector have different lengths.

Compilation flags:
`static`

Template:
`matrix_vector_product(Matrix,Vector,Product)`
Mode and number of proofs:
`matrix_vector_product(+list(list(number)),+list(number),-list(number))` - `zero_or_one`

---

matrix_matrix_product/3

Computes the matrix-matrix product for two numeric matrices.

Compilation flags:
`static`

Template:
`matrix_matrix_product(Matrix1,Matrix2,Product)`
Mode and number of proofs:
`matrix_matrix_product(+list(list(number)),+list(list(number)),-list(list(number)))` - `one`

---

gram_matrix/2

Computes the row Gram matrix of a numeric row matrix by taking all row-wise dot products. For N zero-width rows, returns an N by N matrix filled with 0.0. Fails when the input rows have different lengths.

Compilation flags:
`static`

Template:
`gram_matrix(Rows,GramMatrix)`
Mode and number of proofs:
`gram_matrix(+list(list(number)),-list(list(number)))` - `zero_or_one`

---

matrix_row_means/2

Computes the arithmetic mean of each row in a numeric matrix.

Compilation flags:
`static`

Template:
`matrix_row_means(Matrix,Means)`
Mode and number of proofs:
`matrix_row_means(+list(list(number)),-list(number))` - `one`

Exceptions:
`Matrix` contains an empty row `Row`:
`domain_error(minimum_number_of_values(1),Row)`

---

matrix_column_means/2

Computes the arithmetic mean of each column in a numeric matrix.

Compilation flags:
`static`

Template:
`matrix_column_means(Matrix,Means)`
Mode and number of proofs:
`matrix_column_means(+list(list(number)),-list(number))` - `one`

---

center_gram_matrix/4

Double-centers a numeric Gram matrix and also returns its row means and total mean.

Compilation flags:
`static`

Template:
`center_gram_matrix(GramMatrix,CenteredGramMatrix,RowMeans,TotalMean)`
Mode and number of proofs:
`center_gram_matrix(+list(list(number)),-list(list(number)),-list(number),-number)` - `one`

Exceptions:
`GramMatrix` is empty:
`domain_error(minimum_number_of_values(1),GramMatrix)`
`GramMatrix` contains an empty row `Row`:

domain_error(minimum_number_of_values(1),Row)

---

center_gram_vector/4

Centers a numeric Gram vector using training row means and total mean.

Compilation flags:
static

Template:
center_gram_vector(GramVector,RowMeans,TotalMean,CenteredGramVector)

Mode and number of proofs:
center_gram_vector(+list(number),+list(number),+number,-list(number)) - one

Exceptions:
GramVector is empty:
domain_error(minimum_number_of_values(1),GramVector)

---

outer_product/3

Computes the outer product of two numeric vectors.

Compilation flags:
static

Template:
outer_product(Vector1,Vector2,Matrix)

Mode and number of proofs:
outer_product(+list(number),+list(number),-list(list(number))) - one

---

add_matrices/3

Adds two numeric matrices element-wise.

Compilation flags:
static

Template:
add_matrices(Matrix1,Matrix2,Matrix)

Mode and number of proofs:
add_matrices(+list(list(number)),+list(list(number)),-list(list(number))) - one

---

subtract_matrices/3

Subtracts the second numeric matrix from the first element-wise.

Compilation flags:
`static`

Template:
`subtract_matrices(Matrix1,Matrix2,Matrix)`
Mode and number of proofs:
`subtract_matrices(+list(list(number)),+list(list(number)),-list(list(number)))` - `one`

---

scale_matrix/3

Scales each element of a numeric matrix by the given factor.

Compilation flags:
`static`

Template:
`scale_matrix(Matrix,Scale,ScaledMatrix)`
Mode and number of proofs:
`scale_matrix(+list(list(number)),+number,-list(list(number)))` - `one`

---

frobenius_norm/2

Computes the Frobenius norm of a numeric matrix.

Compilation flags:
`static`

Template:
`frobenius_norm(Matrix,Norm)`
Mode and number of proofs:
`frobenius_norm(+list(list(number)),-float)` - `one_or_error`

Exceptions:
`Matrix` is not a rectangular matrix:
`domain_error(rectangular_matrix,Matrix)`

---

transpose_matrix/2

Transposes a numeric matrix represented as a list of row lists.

Compilation flags:
`static`

Template:
`transpose_matrix(Matrix,Transpose)`
Mode and number of proofs:
`transpose_matrix(+list(list(number)),-list(list(number)))` - `one`

---

vector_value/3

Looks up a numeric vector element using a one-based index.

Compilation flags:
`static`

Template:
`vector_value(Vector,Index,Value)`
Mode and number of proofs:
`vector_value(+list(number),+integer,-number)` - `one`

Exceptions:
`Index` is a variable:
`instantiation_error`
`Index` is neither a variable nor an integer:
`type_error(integer,Index)`
`Index` is an integer that is less than one:
`domain_error(positive_integer,Index)`

---

matrix_row/3

Looks up a numeric matrix row using a one-based row index.

Compilation flags:
`static`

Template:
`matrix_row(Matrix,RowIndex,Row)`
Mode and number of proofs:
`matrix_row(+list(list(number)),+integer,-list(number))` - `one`

Exceptions:

`RowIndex` is a variable:
`instantiation_error`
`RowIndex` is neither a variable nor an integer:
`type_error(integer,RowIndex)`
`RowIndex` is an integer that is less than one:
`domain_error(positive_integer,RowIndex)`

---

matrix_column/3

Looks up a numeric matrix column using a one-based column index.

Compilation flags:
`static`

Template:
`matrix_column(Matrix,ColumnIndex,Column)`
Mode and number of proofs:
`matrix_column(+list(list(number)),+integer,-list(number))` - `one`

Exceptions:
`ColumnIndex` is a variable:
`instantiation_error`
`ColumnIndex` is neither a variable nor an integer:
`type_error(integer,ColumnIndex)`
`ColumnIndex` is an integer that is less than one:
`domain_error(positive_integer,ColumnIndex)`

---

matrix_value/4

Looks up a numeric matrix element using one-based row and column indices.

Compilation flags:
`static`

Template:
`matrix_value(Matrix,RowIndex,ColumnIndex,Value)`
Mode and number of proofs:
`matrix_value(+list(list(number)),+integer,+integer,-number)` - `one`

Exceptions:
`RowIndex` is a variable:
`instantiation_error`
`ColumnIndex` is a variable:
`instantiation_error`

`RowIndex` is neither a variable nor an integer:
```
type_error(integer,RowIndex)
```
`ColumnIndex` is neither a variable nor an integer:
```
type_error(integer,ColumnIndex)
```
`RowIndex` is an integer that is less than one:
```
domain_error(positive_integer,RowIndex)
```
`ColumnIndex` is an integer that is less than one:
```
domain_error(positive_integer,ColumnIndex)
```

---

matrix_diagonal/2

Extracts the main diagonal of a numeric matrix as a vector.

Compilation flags:
```
static
```

Template:
```
matrix_diagonal(Matrix,Diagonal)
```
Mode and number of proofs:
```
matrix_diagonal(+list(list(number)),-list(number)) - one
```

Exceptions:
`Matrix` is not a rectangular matrix:
```
domain_error(rectangular_matrix,Matrix)
```

---

matrix_diagonal/3

Extracts the diagonal of a numeric matrix at the given offset, where positive offsets select superdiagonals and negative offsets select subdiagonals.

Compilation flags:
```
static
```

Template:
```
matrix_diagonal(Matrix,Offset,Diagonal)
```
Mode and number of proofs:
```
matrix_diagonal(+list(list(number)),+integer,-list(number)) - one_or_error
```

Exceptions:
`Offset` is a variable:
```
instantiation_error
```
`Offset` is neither a variable nor an integer:
```
type_error(integer,Offset)
```
`Matrix` is not a rectangular matrix:
```
domain_error(rectangular_matrix,Matrix)
```

diagonal_matrix/2

Constructs a square diagonal matrix from a numeric vector of diagonal entries.

Compilation flags:
`static`

Template:
`diagonal_matrix(Diagonal,Matrix)`
Mode and number of proofs:
`diagonal_matrix(+list(number),-list(list(number)))` - `one`

diagonal_matrix/3

Constructs the minimal square numeric matrix whose diagonal at the given offset matches the input vector.

Compilation flags:
`static`

Template:
`diagonal_matrix(Diagonal,Offset,Matrix)`
Mode and number of proofs:
`diagonal_matrix(+list(number),+integer,-list(list(number)))` - `one_or_error`

Exceptions:
`Offset` is a variable:
`instantiation_error`
`Offset` is neither a variable nor an integer:
`type_error(integer,Offset)`

diagonal_matrix/4

Constructs a square numeric matrix of the requested size whose diagonal at the given offset matches the input vector.

Compilation flags:
`static`

Template:
`diagonal_matrix(Diagonal,Offset,Size,Matrix)`
Mode and number of proofs:
`diagonal_matrix(+list(number),+integer,+integer,-list(list(number)))` - `one_or_error`

Exceptions:

`Offset` is a variable:

```
instantiation_error
```

`Offset` is neither a variable nor an integer:

```
type_error(integer,Offset)
```

`Size` is a variable:

```
instantiation_error
```

`Size` is neither a variable nor an integer:

```
type_error(integer,Size)
```

`Size` is an integer that is less than zero:

```
domain_error(non_negative_integer,Size)
```

`Size` is smaller than the minimum size required by `Diagonal` and `Offset`:

```
domain_error(minimum_matrix_size(A),Size)
```

---

matrix_trace/2

Computes the trace of a numeric matrix by summing its main diagonal entries.

Compilation flags:

```
static
```

Template:

```
matrix_trace(Matrix,Trace)
```

Mode and number of proofs:

```
matrix_trace(+list(list(number)),-number) - one
```

Exceptions:

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

---

shift_matrix_diagonal/3

Shifts the main diagonal of a numeric matrix by the given value.

Compilation flags:

```
static
```

Template:

```
shift_matrix_diagonal(Matrix,Shift,ShiftedMatrix)
```

Mode and number of proofs:

```
shift_matrix_diagonal(+list(list(number)),+number,-list(list(number))) - one
```

Exceptions:

`Shift` is a variable:

```
instantiation_error
```

`Shift` is neither a variable nor a number:
```
type_error(number,Shift)
```

---

upper_triangular_part/2

Returns the upper-triangular part of a numeric matrix including the main diagonal.

Compilation flags:
```
static
```

Template:
```
upper_triangular_part(Matrix,UpperTriangular)
```
Mode and number of proofs:
```
upper_triangular_part(+list(list(number)),-list(list(number))) - one_or_error
```

Exceptions:
`Matrix` is not a rectangular matrix:
```
domain_error(rectangular_matrix,Matrix)
```

---

upper_triangular_part/3

Returns the upper-triangular part of a numeric matrix using the given diagonal offset, where positive offsets exclude leading diagonals and negative offsets include additional subdiagonals.

Compilation flags:
```
static
```

Template:
```
upper_triangular_part(Matrix,Offset,UpperTriangular)
```
Mode and number of proofs:
```
upper_triangular_part(+list(list(number)),+integer,-list(list(number))) -
one_or_error
```

Exceptions:
`Offset` is a variable:
```
instantiation_error
```
`Offset` is neither a variable nor an integer:
```
type_error(integer,Offset)
```
`Matrix` is not a rectangular matrix:
```
domain_error(rectangular_matrix,Matrix)
```

---

lower_triangular_part/2

Returns the lower-triangular part of a numeric matrix including the main diagonal.

Compilation flags:

```
static
```

Template:

```
lower_triangular_part(Matrix,LowerTriangular)
```

Mode and number of proofs:

```
lower_triangular_part(+list(list(number)),-list(list(number)))-one_or_error
```

Exceptions:

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

---

lower_triangular_part/3

Returns the lower-triangular part of a numeric matrix using the given diagonal offset, where positive offsets include additional superdiagonals and negative offsets exclude leading diagonals below the main diagonal.

Compilation flags:

```
static
```

Template:

```
lower_triangular_part(Matrix,Offset,LowerTriangular)
```

Mode and number of proofs:

```
lower_triangular_part(+list(list(number)),+integer,-list(list(number)))-
one_or_error
```

Exceptions:

`Offset` is a variable:

```
instantiation_error
```

`Offset` is neither a variable nor an integer:

```
type_error(integer,Offset)
```

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

---

solve_linear_system/3

Solves a non-singular square numeric linear system with a vector right-hand side using pivoted elimination.

Compilation flags:
`static`

Template:
`solve_linear_system(Matrix,Values,Solution)`
Mode and number of proofs:
`solve_linear_system(+list(list(number)),+list(number),-list(float))` - `one_or_error`

Exceptions:
`Matrix` is not a square matrix:
`domain_error(square_matrix,Matrix)`
`Values` does not have the same length as the size of `Matrix`:
`domain_error(vector_length(A),Values)`
`Matrix` is singular:
`evaluation_error(zero_divisor)`

---

solve_linear_systems/3

Solves a non-singular square numeric linear system with a matrix right-hand side using pivoted elimination.

Compilation flags:
`static`

Template:
`solve_linear_systems(Matrix,RightHandSides,Solutions)`
Mode and number of proofs:
`solve_linear_systems(+list(list(number)),+list(list(number)),-list(list(float)))` - `one_or_error`

Exceptions:
`Matrix` is not a square matrix:
`domain_error(square_matrix,Matrix)`
`RightHandSides` does not have the same number of rows as the size of `Matrix`:
`domain_error(matrix_row_count(A),RightHandSides)`
`Matrix` is singular:
`evaluation_error(zero_divisor)`

---

determinant/2

Computes the determinant of a square numeric matrix.

Compilation flags:
`static`

Template:
`determinant(Matrix,Determinant)`
Mode and number of proofs:
`determinant(+list(list(number)),-number)` - `one_or_error`

Exceptions:
`Matrix` is not a square matrix:
`domain_error(square_matrix,Matrix)`

---

inverse_matrix/2

Computes the inverse of a non-singular square numeric matrix by solving one linear system per identity column.

Compilation flags:
`static`

Template:
`inverse_matrix(Matrix,Inverse)`
Mode and number of proofs:
`inverse_matrix(+list(list(number)),-list(list(float)))` - `one_or_error`

Exceptions:
`Matrix` is not a square matrix:
`domain_error(square_matrix,Matrix)`
`Matrix` is singular:
`evaluation_error(zero_divisor)`

---

qr_decomposition/3

Computes a thin QR decomposition of a rectangular numeric matrix, returning orthogonal columns and an upper-trapezoidal factor.

Compilation flags:
`static`

Template:
`qr_decomposition(Matrix,Orthogonal,UpperTriangular)`
Mode and number of proofs:

```
qr_decomposition(+list(list(number)),-list(list(float)),-list(list(float))) -
one_or_error
```

Exceptions:

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

---

least_squares/3

Computes a least-squares solution for a rectangular numeric linear system using a pivoted orthogonal solve without forming normal equations.

Compilation flags:

```
static
```

Template:

```
least_squares(Matrix,Values,Solution)
```

Mode and number of proofs:

```
least_squares(+list(list(number)),+list(number),-list(float)) - one_or_error
```

Exceptions:

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

`Values` does not have the same length as the number of rows of `Matrix`:

```
domain_error(vector_length(A),Values)
```

---

matrix_rank/2

Estimates the rank of a numeric matrix using the default library numerical tolerance of 1.0e-12.

Compilation flags:

```
static
```

Template:

```
matrix_rank(Matrix,Rank)
```

Mode and number of proofs:

```
matrix_rank(+list(list(number)),-integer) - one_or_error
```

Exceptions:

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

---

matrix_rank/3

Estimates the rank of a numeric matrix using the given non-negative numerical tolerance.

Compilation flags:

`static`

Template:

`matrix_rank(Matrix,Tolerance,Rank)`

Mode and number of proofs:

`matrix_rank(+list(list(number)),+number,-integer)` - `one_or_error`

Exceptions:

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a number but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

`Matrix` is not a rectangular matrix:

`domain_error(rectangular_matrix,Matrix)`

---

symmetric_eigen/3

Computes an orthonormal eigendecomposition of a real symmetric dense matrix using the default library numerical tolerance of 1.0e-12.

Compilation flags:

`static`

Template:

`symmetric_eigen(Matrix,Eigenvectors,Eigenvalues)`

Mode and number of proofs:

`symmetric_eigen(+list(list(number)),-list(list(float)),-list(float))` - `one_or_error`

Exceptions:

`Matrix` is not a square matrix:

`domain_error(square_matrix,Matrix)`

`Matrix` is not symmetric within the default numerical tolerance:

`domain_error(symmetric_matrix,Matrix)`

---

symmetric_eigen/4

Computes an orthonormal eigendecomposition of a real symmetric dense matrix using the given non-negative numerical tolerance.

Compilation flags:
`static`

Template:
`symmetric_eigen(Matrix,Tolerance,Eigenvectors,Eigenvalues)`

Mode and number of proofs:
`symmetric_eigen(+list(list(number)),+number,-list(list(float)),-list(float))` - `one_or_error`

Exceptions:
`Tolerance` is a variable:
`instantiation_error`
`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`Tolerance` is a number but not a non-negative number:
`domain_error(non_negative_number,Tolerance)`
`Matrix` is not a square matrix:
`domain_error(square_matrix,Matrix)`
`Matrix` is not symmetric within `Tolerance`:
`domain_error(symmetric_matrix,Matrix)`

---

symmetric_eigen/5

Computes an orthonormal eigendecomposition of a real symmetric dense matrix using the given non-negative numerical tolerance and positive iteration bound.

Compilation flags:
`static`

Template:
`symmetric_eigen(Matrix,Tolerance,MaximumIterations,Eigenvectors,Eigenvalues)`

Mode and number of proofs:
`symmetric_eigen(+list(list(number)),+number,+integer,-list(list(float)),-list(float))` - `one_or_error`

Exceptions:
`Tolerance` is a variable:
`instantiation_error`
`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`Tolerance` is a number but not a non-negative number:
`domain_error(non_negative_number,Tolerance)`
`MaximumIterations` is a variable:
`instantiation_error`

`MaximumIterations` is neither a variable nor an integer:
`type_error(integer,MaximumIterations)`
`MaximumIterations` is an integer that is less than one:
`domain_error(positive_integer,MaximumIterations)`
`Matrix` is not a square matrix:
`domain_error(square_matrix,Matrix)`
`Matrix` is not symmetric within `Tolerance`:
`domain_error(symmetric_matrix,Matrix)`

---

symmetric_eigen_partial/7

Computes a bounded partial largest-magnitude symmetric eigendecomposition with residual and orthogonality diagnostics. Returns eigenpairs in descending algebraic order.

Compilation flags:
`static`

Template:
`symmetric_eigen_partial(Matrix,Count,Tolerance,MaximumIterations,Eigenvectors,Eigenvalues,Diagnostics)`

Mode and number of proofs:
`symmetric_eigen_partial(+list(list(number)),+integer,+number,+integer,-list(list(float)),-list(float),-list(compound))` - `one_or_error`

Exceptions:
`Count`, `Tolerance`, or `MaximumIterations` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`MaximumIterations` is neither a variable nor an integer:
`type_error(integer,MaximumIterations)`
`Count` is an integer less than zero:
`domain_error(non_negative_integer,Count)`
`Count` exceeds the matrix dimension:
`domain_error(component_count(0,Size),Count)`
`Tolerance` is a negative number:
`domain_error(non_negative_number,Tolerance)`
`MaximumIterations` is an integer less than one:
`domain_error(positive_integer,MaximumIterations)`
`Matrix` is not square:
`domain_error(square_matrix,Matrix)`
`Matrix` is not symmetric within `Tolerance`:
`domain_error(symmetric_matrix,Matrix)`

---

pseudo_inverse/2

Computes the Moore-Penrose pseudo-inverse of a rectangular numeric matrix using the default library numerical tolerance of 1.0e-12.

Compilation flags:
`static`

Template:
`pseudo_inverse(Matrix,PseudoInverse)`
Mode and number of proofs:
`pseudo_inverse(+list(list(number)),-list(list(float)))` - `one_or_error`

Exceptions:
`Matrix` is not a rectangular matrix:
`domain_error(rectangular_matrix,Matrix)`

---

pseudo_inverse/3

Computes the Moore-Penrose pseudo-inverse of a rectangular numeric matrix using the given non-negative numerical tolerance.

Compilation flags:
`static`

Template:
`pseudo_inverse(Matrix,Tolerance,PseudoInverse)`
Mode and number of proofs:
`pseudo_inverse(+list(list(number)),+number,-list(list(float)))` - `one_or_error`

Exceptions:
`Tolerance` is a variable:
`instantiation_error`
`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`Tolerance` is a number but not a non-negative number:
`domain_error(non_negative_number,Tolerance)`
`Matrix` is not a rectangular matrix:
`domain_error(rectangular_matrix,Matrix)`

---

null_space/2

Computes an orthonormal basis for the right null space of a rectangular numeric matrix using the default library numerical tolerance of 1.0e-12.

Compilation flags:

```
static
```

Template:

```
null_space(Matrix,Basis)
```

Mode and number of proofs:

```
null_space(+list(list(number)),-list(list(float))) - one_or_error
```

Exceptions:

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

---

null_space/3

Computes an orthonormal basis for the right null space of a rectangular numeric matrix using the given non-negative numerical tolerance.

Compilation flags:

```
static
```

Template:

```
null_space(Matrix,Tolerance,Basis)
```

Mode and number of proofs:

```
null_space(+list(list(number)),+number,-list(list(float))) - one_or_error
```

Exceptions:

`Tolerance` is a variable:

```
instantiation_error
```

`Tolerance` is neither a variable nor a number:

```
type_error(number,Tolerance)
```

`Tolerance` is a number but not a non-negative number:

```
domain_error(non_negative_number,Tolerance)
```

`Matrix` is not a rectangular matrix:

```
domain_error(rectangular_matrix,Matrix)
```

---

normalize_vector/2

Normalizes a numeric vector to unit length when its norm is above the default library numerical tolerance of 1.0e-12.

Compilation flags:
`static`

Template:
`normalize_vector(Vector,NormalizedVector)`
Mode and number of proofs:
`normalize_vector(+list(number),-list(number))` - `one`

---

normalize_vector/3

Normalizes a numeric vector to unit length when its norm is above the given non-negative numerical tolerance.

Compilation flags:
`static`

Template:
`normalize_vector(Vector,Tolerance,NormalizedVector)`
Mode and number of proofs:
`normalize_vector(+list(number),+number,-list(number))` - `one_or_error`

Exceptions:
`Tolerance` is a variable:
`instantiation_error`
`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`Tolerance` is a number but not a non-negative number:
`domain_error(non_negative_number,Tolerance)`

---

difference_norm/3

Computes the Euclidean norm of the difference between two numeric vectors.

Compilation flags:
`static`

Template:
`difference_norm(Vector1,Vector2,Norm)`
Mode and number of proofs:
`difference_norm(+list(number),+list(number),-float)` - `one`

---

stabilize_vector_sign/2

Normalizes a vector sign convention by flipping vectors whose first significant component is negative.

Compilation flags:
`static`

Template:
`stabilize_vector_sign(Vector,StableVector)`
Mode and number of proofs:
`stabilize_vector_sign(+list(number),-list(number))` - `one`

---

stabilize_vector_sign/3

Normalizes a vector sign convention by flipping vectors whose first significant component under the given non-negative numerical tolerance is negative.

Compilation flags:
`static`

Template:
`stabilize_vector_sign(Vector,Tolerance,StableVector)`
Mode and number of proofs:
`stabilize_vector_sign(+list(number),+number,-list(number))` - `one_or_error`

Exceptions:
`Tolerance` is a variable:
`instantiation_error`
`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`Tolerance` is a number but not a non-negative number:
`domain_error(non_negative_number,Tolerance)`

---

first_significant_component/2

Returns the first component whose absolute value exceeds the default library numerical tolerance of 1.0e-12, defaulting to zero when no such component exists.

Compilation flags:
`static`

Template:
`first_significant_component(Vector,First)`
Mode and number of proofs:
`first_significant_component(+list(number),-number)` - `one`

---

first_significant_component/3

Returns the first component whose absolute value exceeds the given non-negative numerical tolerance, defaulting to zero when no such component exists.

Compilation flags:

```
static
```

Template:

```
first_significant_component(Vector,Tolerance,First)
```

Mode and number of proofs:

```
first_significant_component(+list(number),+number,-number) - one_or_error
```

Exceptions:

`Tolerance` is a variable:

```
instantiation_error
```

`Tolerance` is neither a variable nor a number:

```
type_error(number,Tolerance)
```

`Tolerance` is a number but not a non-negative number:

```
domain_error(non_negative_number,Tolerance)
```

---

add_scaled_outer_product/4

Adds a scaled outer product of a vector with itself to an accumulated matrix.

Compilation flags:

```
static
```

Template:

```
add_scaled_outer_product(Vector,Scale,Matrix0,Matrix)
```

Mode and number of proofs:

```
add_scaled_outer_product(+list(number),+number,+list(list(number)),
-list(list(number))) - one
```

Exceptions:

`Scale` is a variable:

```
instantiation_error
```

`Scale` is neither a variable nor a number:

```
type_error(number,Scale)
```

---

covariance_matrix/2

Computes the sample covariance matrix from a list of centered numeric row vectors.

Compilation flags:
`static`

Template:
`covariance_matrix(Rows,CovarianceMatrix)`
Mode and number of proofs:
`covariance_matrix(+list(list(number)),-list(list(number)))` - `one_or_error`

Exceptions:
`Rows` contains fewer than two rows:
`domain_error(minimum_number_of_rows(2),Rows)`

---

cholesky_decomposition/2

Computes the lower-triangular Cholesky factor of a positive definite numeric matrix.

Compilation flags:
`static`

Template:
`cholesky_decomposition(Matrix,CholeskyFactor)`
Mode and number of proofs:
`cholesky_decomposition(+list(list(number)),-list(list(float)))` - `one_or_error`

Exceptions:
`Matrix` is not numerically positive definite:
`domain_error(positive_definite_matrix,Matrix)`

---

solve_cholesky/3

Solves a positive definite linear system from a lower-triangular Cholesky factor and a right-hand-side vector.

Compilation flags:
`static`

Template:
`solve_cholesky(CholeskyFactor,Values,Solution)`
Mode and number of proofs:
`solve_cholesky(+list(list(number)),+list(number),-list(float))` - `one`

---

forward_substitution/3

Solves a lower-triangular system by forward substitution.

Compilation flags:
```
static
```

Template:
```
forward_substitution(LowerTriangular,Values,Solution)
```
Mode and number of proofs:
```
forward_substitution(+list(list(number)),+list(number),-list(float)) - one
```

---

solve_lower_triangular_matrix/3

Solves a lower-triangular system with a matrix right-hand side by forward substitution on each column.

Compilation flags:
```
static
```

Template:
```
solve_lower_triangular_matrix(LowerTriangular,Matrix,Solution)
```
Mode and number of proofs:
```
solve_lower_triangular_matrix(+list(list(number)),+list(list(number)),
-list(list(float))) - one
```

---

solve_upper_triangular/3

Solves an upper-triangular system by backward substitution.

Compilation flags:
```
static
```

Template:
```
solve_upper_triangular(UpperTriangular,Values,Solution)
```
Mode and number of proofs:
```
solve_upper_triangular(+list(list(number)),+list(number),-list(float)) - one
```

---

solve_upper_triangular_matrix/3

Solves an upper-triangular system with a matrix right-hand side by backward substitution on each column.

Compilation flags:

```
static
```

Template:

```
solve_upper_triangular_matrix(UpperTriangular,Matrix,Solution)
```

Mode and number of proofs:

```
solve_upper_triangular_matrix(+list(list(number)),+list(list(number)),
-list(list(float))) - one
```

---

backward_substitution/3

Solves the transposed upper-triangular system induced by a lower-triangular Cholesky factor using backward substitution.

Compilation flags:

```
static
```

Template:

```
backward_substitution(CholeskyFactor,Values,Solution)
```

Mode and number of proofs:

```
backward_substitution(+list(list(number)),+list(number),-list(float)) - one
```

---

invert_from_cholesky/2

Computes a matrix inverse from a Cholesky factor by solving one linear system per basis column.

Compilation flags:

```
static
```

Template:

```
invert_from_cholesky(CholeskyFactor,Inverse)
```

Mode and number of proofs:

```
invert_from_cholesky(+list(list(number)),-list(list(float))) - one
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

check_problem/1

Checks that the argument is a structurally valid linear-program problem.

Compilation flags:
`static`

Template:
`check_problem(Problem)`
Mode and number of proofs:
`check_problem(@term)` - `one_or_error`

Exceptions:
`Problem` is a variable:
`instantiation_error`
`Problem` is not a linear-program problem:
`type_error(linear_program,Problem)`

---

check_result/1

Checks that the argument is a structurally valid linear-programming result.

Compilation flags:
`static`

Template:
`check_result(Result)`
Mode and number of proofs:
`check_result(@term)` - `one_or_error`

Exceptions:
`Result` is a variable:
`instantiation_error`

`Result` is not a linear-programming result:
`type_error(linear_programming_result,Result)`

---

relax_problem/2

Returns the continuous relaxation of a validated linear-program problem.

Compilation flags:
`static`

Template:
`relax_problem(Problem,Relaxation)`
Mode and number of proofs:
`relax_problem(+compound,-compound)` - `one`

---

discrete_variables/2

Returns the integer and binary variable declarations of a validated linear-program problem in declaration order.

Compilation flags:
`static`

Template:
`discrete_variables(Problem,Variables)`
Mode and number of proofs:
`discrete_variables(+compound,-list(compound))` - `one`

---

tighten_variable_bounds/5

Returns a copy of a validated problem with the named variable bounds tightened to the given finite bounds.

Compilation flags:
`static`

Template:
`tighten_variable_bounds(Name,Lower,Upper,Problem0,Problem)`
Mode and number of proofs:
`tighten_variable_bounds(+term,+number,+number,+compound,-compound)` - `one_or_error`

Exceptions:
An argument is insufficiently instantiated:
`instantiation_error`

`Problem0` is not a linear-program problem:
```
type_error(linear_program,Problem0)
```
`Name` is not a declared variable:
```
domain_error(linear_programming_variable,Name)
```
The bounds are invalid, inconsistent, or weaken the current bounds:
```
domain_error(linear_programming_bounds,Lower-Upper)
```

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

protocol

1.202.2 `linear_programming_protocol`

Protocol for immutable linear-program construction, solving, and result inspection.

Availability:
```
logtalk_load(linear_programming(loader))
```

Author: Paulo Moura
Version: 1:0:0

Public predicates

new_problem/1

Creates an empty linear-program problem.

Compilation flags:
`static`

Template:
`new_problem(Problem)`

Mode and number of proofs:
`new_problem(-compound)` - `one`

---

variable/4

Adds a variable with default bounds. Continuous and integer variables default to zero and positive infinity; binary variables default to zero and one. The variable type is `continuous`, `integer`, or `binary`.

Compilation flags:
`static`

Template:
`variable(Name,Type,Problem0,Problem)`

Mode and number of proofs:
`variable(+term,+atom,+compound,-compound)` - `one_or_error`

Exceptions:
An argument is insufficiently instantiated:
`instantiation_error`
`Problem0` is not a linear-program problem:
`type_error(linear_program,Problem0)`

`Type` is not a supported variable type:
`domain_error(linear_programming_variable_type,Type)`
`Name` is already declared:
`domain_error(linear_programming_variable,Name)`

---

variable/6

Adds a variable with explicit lower and upper bounds. A bound is a number, `inf`, or `-inf` as appropriate.

Compilation flags:
`static`

Template:
`variable(Name,Type,Lower,Upper,Problem0,Problem)`
Mode and number of proofs:
`variable(+term,+atom,+term,+term,+compound,-compound)` - `one_or_error`

Exceptions:
An argument is insufficiently instantiated:
`instantiation_error`
`Problem0` is not a linear-program problem:
`type_error(linear_program,Problem0)`
`Type` is not a supported variable type:
`domain_error(linear_programming_variable_type,Type)`
`Name` is already declared:
`domain_error(linear_programming_variable,Name)`
The bounds are invalid or inconsistent:
`domain_error(linear_programming_bounds,Lower-Upper)`

---

constraint/5

Adds a linear constraint. `Coefficients` is a list of `Coefficient*Variable` terms and `Sense` is `=<`, `>=`, or `=`.

Compilation flags:
`static`

Template:
`constraint(Coefficients,Sense,RightHandSide,Problem0,Problem)`
Mode and number of proofs:
`constraint(+list(compound),+atom,+number,+compound,-compound)` - `one_or_error`

Exceptions:
An argument is insufficiently instantiated:
`instantiation_error`

`Problem0` is not a linear-program problem:
`type_error(linear_program,Problem0)`
`Coefficients` is not a list of coefficient-variable terms:
`type_error(linear_expression,Coefficients)`
`Sense` is not a supported constraint sense:
`domain_error(linear_programming_constraint_sense,Sense)`
A coefficient references an undeclared variable:
`domain_error(linear_programming_variable,Variable)`

---

constraints/3

Adds a list of `constraint(Coefficients, Sense, RightHandSide)` terms.

Compilation flags:
`static`

Template:
`constraints(Constraints,Problem0,Problem)`
Mode and number of proofs:
`constraints(+list(compound),+compound,-compound)` - `one_or_error`

Exceptions:
An argument is insufficiently instantiated:
`instantiation_error`
`Constraints` is not a list of valid constraint terms:
`type_error(linear_programming_constraints,Constraints)`
`Problem0` is not a linear-program problem:
`type_error(linear_program,Problem0)`

---

objective/4

Sets the linear objective. `Coefficients` is a list of `Coefficient*Variable` terms and `Sense` is `minimize` or `maximize`.

Compilation flags:
`static`

Template:
`objective(Coefficients,Sense,Problem0,Problem)`
Mode and number of proofs:
`objective(+list(compound),+atom,+compound,-compound)` - `one_or_error`

Exceptions:
An argument is insufficiently instantiated:
`instantiation_error`

`Problem0` is not a linear-program problem:
`type_error(linear_program,Problem0)`
`Coefficients` is not a list of coefficient-variable terms:
`type_error(linear_expression,Coefficients)`
`Sense` is not a supported objective sense:
`domain_error(linear_programming_objective_sense,Sense)`
The problem already has an objective:
`domain_error(linear_programming_objective,Problem0)`
A coefficient references an undeclared variable:
`domain_error(linear_programming_variable,Variable)`

---

problem_from_matrices/8

Creates a problem from a dense objective vector, objective sense, equality rows and right-hand sides, less-than-or-equal rows and right-hand sides, and variable bounds. Variables are named by their one-based column indices.

Compilation flags:
`static`

Template:
```
problem_from_matrices(Objective,ObjectiveSense,EqualityMatrix,
EqualityRightHandSide,InequalityMatrix,InequalityRightHandSide,Bounds,Problem)
```
Mode and number of proofs:
```
problem_from_matrices(+list(number),+atom,+list(list(number)),+list(number),
+list(list(number)),+list(number),+list(pair),-compound) - one_or_error
```

Exceptions:
An argument is insufficiently instantiated:
`instantiation_error`
The matrix and vector dimensions are inconsistent:
`domain_error(linear_programming_dimensions,Objective)`
An input is not a numeric vector, numeric matrix, or valid bounds list:
`type_error(linear_programming_matrix_problem,Objective)`

---

solve/2

Solves a linear-program problem using default options and returns a result term. Solver statuses include `optimal`, `infeasible`, `unbounded`, `iteration_limit`, `node_limit`, and `numerical_error` as applicable to the backend.

Compilation flags:
`static`

Template:
`solve(Problem,Result)`
Mode and number of proofs:

`solve(+compound,-compound)` - `one_or_error`

Exceptions:

`Problem` is a variable:
`instantiation_error`
`Problem` is not a linear-program problem:
`type_error(linear_program,Problem)`
`Problem` has no variables:
`domain_error(linear_programming_problem,empty)`
`Problem` has no objective:
`domain_error(linear_programming_problem,missing_objective)`
`Problem` contains a variable type unsupported by the backend:
`domain_error(simplex_variable_type,Variable-Type)`
A discrete variable does not have finite bounds:
`domain_error(milp_finite_integer_bounds,Variable-(Lower-Upper))`
A discrete variable domain contains no integer:
`domain_error(milp_integer_domain,Variable-(Lower-Upper))`

`solve/3`

Solves a linear-program problem using the specified options and returns a result term. Solver statuses include `optimal`, `infeasible`, `unbounded`, `iteration_limit`, `node_limit`, and `numerical_error` as applicable to the backend.

Compilation flags:
`static`

Template:
`solve(Problem,Result,Options)`
Mode and number of proofs:
`solve(+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Problem` is a variable:
`instantiation_error`
`Problem` is not a linear-program problem:
`type_error(linear_program,Problem)`
`Problem` has no variables:
`domain_error(linear_programming_problem,empty)`
`Problem` has no objective:
`domain_error(linear_programming_problem,missing_objective)`
`Problem` contains a variable type unsupported by the backend:
`domain_error(simplex_variable_type,Variable-Type)`
A discrete variable does not have finite bounds:
`domain_error(milp_finite_integer_bounds,Variable-(Lower-Upper))`
A discrete variable domain contains no integer:
`domain_error(milp_integer_domain,Variable-(Lower-Upper))`
`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

---

status/2

Returns the result status.

Compilation flags:

`static`

Template:

`status(Result,Status)`

Mode and number of proofs:

`status(+compound,-atom)` - `one_or_error`

Exceptions:

`Result` is a variable:

`instantiation_error`

`Result` is not a linear-programming result:

`type_error(linear_programming_result,Result)`

---

objective_value/2

Returns the optimal objective value. Fails when the result status is not `optimal`.

Compilation flags:

`static`

Template:

`objective_value(Result,Value)`

Mode and number of proofs:

`objective_value(+compound,-number)` - `zero_or_one_or_error`

Exceptions:

`Result` is a variable:

`instantiation_error`

`Result` is not a linear-programming result:

`type_error(linear_programming_result,Result)`

---

variable_value/3

Returns an optimal variable value. Fails when the result status is not `optimal` or the variable is absent.

Compilation flags:
`static`

Template:
`variable_value(Result,Variable,Value)`
Mode and number of proofs:
`variable_value(+compound,+term,-number)` - `zero_or_one_or_error`

Exceptions:
`Result` is a variable:
`instantiation_error`
`Result` is not a linear-programming result:
`type_error(linear_programming_result,Result)`

---

statistics/2

Returns solver statistics stored in a result.

Compilation flags:
`static`

Template:
`statistics(Result,Statistics)`
Mode and number of proofs:
`statistics(+compound,-list(compound))` - `one_or_error`

Exceptions:
`Result` is a variable:
`instantiation_error`
`Result` is not a linear-programming result:
`type_error(linear_programming_result,Result)`

---

print_problem/1

Prints a linear-program problem to the current output stream.

Compilation flags:
`static`

Template:
`print_problem(Problem)`
Mode and number of proofs:
`print_problem(+compound)` - `one_or_error`

Exceptions:
`Problem` is a variable:
`instantiation_error`
`Problem` is not a linear-program problem:
`type_error(linear_program,Problem)`

---

print_solution/1

Prints a linear-program result to the current output stream.

Compilation flags:
`static`

Template:
`print_solution(Result)`
Mode and number of proofs:
`print_solution(+compound)` - `one_or_error`

Exceptions:
`Result` is a variable:
`instantiation_error`
`Result` is not a linear-programming result:
`type_error(linear_programming_result,Result)`

object

1.202.4 `milp_branch_and_bound`

Portable depth-first branch-and-bound solver for small mixed-integer linear programs.

Availability:
`logtalk_load(linear_programming(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-03

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *linear_programming_common*
Uses:
list
simplex

Remarks:

- Discrete domains: Integer and binary variables must have finite bounds. No cutting planes or primal heuristics are used.
- LP relaxations: Each search node is solved using the simplex object.
- Branching: The solver can branch on the first fractional variable or the most fractional variable, with declaration order breaking ties. The lower or upper branch can be explored first.

Inherited public predicates:
check_option/1 check_options/1 constraint/5 constraints/3 default_option/1 default_options/1 new_problem/1 objective/4 objective_value/2 option/2 option/3 print_problem/1 print_solution/1 problem_from_matrices/8 solve/2 solve/3 statistics/2 status/2 valid_option/1 valid_options/1 variable/4 variable/6 variable_value/3

simplex, *linear_programming_protocol*

object

1.202.5 `simplex`

Portable dense two-phase simplex solver for small continuous linear programs.

Availability:
`logtalk_load(linear_programming(loader))`

Author: Paulo Moura
Version: 1:1:0
Date: 2026-09-24

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *linear_programming_common*
Uses:
linear_algebra
list

Remarks:

- Variable types: This backend supports continuous variables only. Integer and binary variables are accepted by the shared model API for use by future MILP backends but rejected when solving.
- Pivoting: Bland's rule is used by default. Dantzig's rule is also available, with the lowest column index breaking ties. Minimum-ratio ties use the lowest-indexed basic variable.

1.205 linter_reporter

object

1.205.1 `linter_reporter`

Intercepts compiler linter warnings and caches them as machine-readable diagnostics.

Availability:
`logtalk_load(linter_reporter(loader))`

Author: Paulo Moura
Version: 1:0:3
Date: 2026-08-12

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *tool_diagnostics_common*
`public` *tutor_explanations*
`public` *options*

Provides:
logtalk::message_hook/4

Uses:
list
logtalk
os
term_io
type
user

Remarks:

- Usage: Load this tool before compiling code to be checked by the built-in linter. Call `enable/0-1` before compiling code, `disable/0` when finished collecting warnings, and then query the cached warnings using either the legacy warning predicates or the diagnostics protocol predicates. The standalone `sarif` tool can generate SARIF reports by querying these diagnostics.
- Diagnostics targets: The diagnostics predicates accept the targets `all`, `entity(Entity)`, `file(File)`, `directory(Directory)`, `rdirectory(Directory)`, `library(Library)`, and `rlibrary(Library)`. These targets simply filter the cached diagnostics collected in the current warning collection session.

Inherited public predicates:

check_option/1 check_options/1 default_option/1 default_options/1 diagnostic/2 diagnostic/3 diagnostic_rule/5 diagnostic_rules/1 diagnostic_target/1 diagnostics/2 diagnostics/3 diagnostics_preflight/2 diagnostics_preflight/3 diagnostics_summary/2 diagnostics_summary/3 diagnostics_tool/5 explain//1 option/2 option/3 valid_option/1 valid_options/1

- *Operators*

Public predicates

enable/0

Enables warning collection and starts a fresh warning collection session using the default options.

Compilation flags:

`static`

Mode and number of proofs:

`enable` - `one`

enable/1

Enables warning collection and starts a fresh warning collection session using the given options.

Compilation flags:
`static`

Template:
`enable(Options)`
Mode and number of proofs:
`enable(+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is not a valid option:
`domain_error(option,Option)`

---

disable/0

Disables warning collection while preserving the cached warnings for later querying.

Compilation flags:
`static`

Mode and number of proofs:
`disable` - `one`

---

reset/0

Clears all cached warnings collected in the current session.

Compilation flags:
`static`

Mode and number of proofs:
`reset` - `one`

---

warning/1

Enumerates normalized linter warnings collected in the current session.

Compilation flags:
`static`

Template:
`warning(Warning)`
Mode and number of proofs:
`warning(-compound)` - `zero_or_more`

---

warnings/1

Returns the collected normalized linter warnings.

Compilation flags:
`static`

Template:
`warnings(Warnings)`
Mode and number of proofs:
`warnings(-list(compound))` - `one`

---

summary/1

Returns a machine-readable summary for the collected linter warnings.

Compilation flags:
`static`

Template:
`summary(Summary)`
Mode and number of proofs:
`summary(-compound)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

enabled_/0

True when warning collection is enabled.

Compilation flags:
`dynamic`

Mode and number of proofs:
`enabled_` - `zero_or_one`

---

warning_sequence_/1

Stores the last assigned warning sequence number.

Compilation flags:
`dynamic`

Template:
`warning_sequence_(Sequence)`
Mode and number of proofs:
`warning_sequence_(-integer)` - `zero_or_one`

---

recorded_warning_/4

Caches collected warnings together with their sequence number, flag, normalized message term, and printed message tokens.

Compilation flags:
`dynamic`

Template:
`recorded_warning_(Sequence,Flag,Message,Tokens)`
Mode and number of proofs:
`recorded_warning_(?integer,?atom,?compound,?list(compound))` - `zero_or_more`

---

collection_options_/1

Stores the merged options for the current warning collection session.

Compilation flags:
`dynamic`

Template:
`collection_options_(Options)`
Mode and number of proofs:
`collection_options_(-list(compound))` - `zero_or_one`

Operators

(none)

1.206 listing

category

1.206.1 listing

Listing predicates.

Availability:
`logtalk_load(listing(loader))`

Author: Paulo Moura
Version: 1:0:1
Date: 2024-11-11

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *listing/0*

    - *listing/1*
    - *portray_clause/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

listing/0

Lists all clauses of all visible dynamic predicates to the current output stream.

Compilation flags:
`static`

Mode and number of proofs:
`listing` - `one`

---

listing/1

Lists all clauses of a visible dynamic predicate or non-terminal to the current output stream. When the argument is a clause head, lists all matching clauses.

Compilation flags:
`static`

Template:
`listing(Spec)`

Mode and number of proofs:
`listing(+predicate_indicator)` - `one_or_error`
`listing(+non_terminal_indicator)` - `one_or_error`
`listing(+callable)` - `one_or_error`

Exceptions:
`Spec` is not a ground term:
`instantiation_error`
`Spec` is ground but not a valid predicate indicator:
`type_error(predicate_indicator,Spec)`
`Spec` is ground but not a valid non-terminal indicator:
`type_error(non_terminal_indicator,Spec)`
`Spec` is a predicate indicator but not a visible predicate:
`existence_error(predicate,Spec)`
`Spec` is a non-terminal indicator but not a visible non-terminal:
`existence_error(non_terminal,Spec)`
`Spec` is a callable term with a `Functor/Arity` indicator but not a visible predicate:
`existence_error(predicate,Functor/Arity)`

`Spec` is a predicate indicator of a visible predicate but not a dynamic predicate:
`permission_error(access,predicate,Spec)`
`Spec` is a non-terminal indicator of a visible non-terminal but not a dynamic non-terminal:
`permission_error(access,non_terminal,Spec)`
`Spec` is a callable term for a visible predicate with a `Functor/Arity` indicator but not a dynamic predicate:
`permission_error(access,predicate,Functor/Arity)`

`portray_clause/1`

Pretty prints a clause to the current output stream.

Compilation flags:
`static`

Template:
`portray_clause(Clause)`
Mode and number of proofs:
`portray_clause(+clause)` - `one`

Protected predicates

1.207 local_optimization

object

1.207.1 `barzilai_borwein(Problem)`

- `Problem` - Problem object implementing `local_optimization_problem_protocol` and defining `gradient/2`.

Barzilai-Borwein (BB) gradient method with adaptive step sizes. Requires the problem to define `gradient/2`. Supports box constraints via projection, minimization and maximization, and BB1 / BB2 / alternating formulas.

Availability:
`logtalk_load(local_optimization(loader))`

Author: Paulo Moura

Version: 1:0:0
Date: 2026-09-03

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *local_optimization_solver(Problem)*

Uses:
linear_algebra
list

Remarks:

- Step formulas: `formula(bb1)` uses `alpha = (s*s)/(s*y)` (long step). `formula(bb2)` uses `alpha = (s*y)/(y*y)` (short step). `formula(alternate)` (default) switches between BB1 and BB2 each iteration.
- Safeguards: When the denominator is near zero or the computed step is outside `[step_min, step_max]`, the previous accepted step (or `step_size` on the first iteration) is reused.
- Line search: Optional non-monotone Armijo acceptance controlled by `line_search(none|armijo)`. The default `none` accepts the pure BB step.
- Bounds: When the problem defines `position_bounds/1`, trial points are projected onto the box after each step.

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *run/2* *run/3* *run/4* *valid_option/1* *valid_options/1*

- *Public predicates*

Uses:

linear_algebra
list

Remarks:

- Update: Maintains a dense approximation to the inverse Hessian, updated after every accepted step with the standard BFGS rank-two formula. The approximation starts at the identity matrix.
- Internal minimization form: Maximization is handled by internally minimizing the negated objective and gradient; the quasi-Newton direction, curvature test, and Armijo condition are therefore always expressed in minimization form, which avoids sign errors in the line search.
- Curvature safeguard: Whenever the curvature condition `y . s > 0` is not comfortably satisfied (possible here since the line search only enforces sufficient decrease, not a Wolfe curvature condition), the inverse-Hessian approximation is reset to the identity matrix and the next step falls back to steepest descent, rather than keeping a stale approximation that would otherwise keep producing the same near-zero-progress direction.
- Restarts: The `restart(N)` option (off by default) periodically resets the inverse-Hessian approximation to the identity matrix, exactly as `conjugate_gradient(_)` resets its search direction.
- Bounds: When the problem defines `position_bounds/1`, trial points are projected onto the box after each step. Projection can weaken the quasi-Newton model; a pure bound-constrained formulation (L-BFGS-B style) is not implemented.

Inherited public predicates:

object

1.207.3 `conjugate_gradient(Problem)`

- `Problem` - Problem object implementing `local_optimization_problem_protocol` and defining `gradient/2`.

Nonlinear conjugate-gradient local optimizer (Fletcher-Reeves and Polak-Ribière). Requires the problem to define `gradient/2`. Supports optional box constraints via projection, minimization and maximization, and periodic or automatic restarts.

Availability:
`logtalk_load(local_optimization(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-03

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *local_optimization_solver(Problem)*

Uses:
linear_algebra
list

Remarks:

- Beta formulas: The `beta(fletcher_reeves)` and `beta(polak_ribiere)` options select the conjugacy coefficient. Polak-Ribière uses the standard non-negative truncation `max(Beta, 0)`.
- Restarts: The search direction is reset to steepest descent every `restart(N)` iterations (default: dimension) and whenever the new direction is insufficiently downhill.
- Line search: Backtracking Armijo line search (same parameters as gradient descent).
- Bounds: When the problem defines `position_bounds/1`, trial points are projected onto the box after each step.

Inherited public predicates:

check_option/1 check_options/1 default_option/1 default_options/1 option/2 option/3 run/2 run/3 run/4 valid_option/1 valid_options/1

object

1.207.5 `lbfgs(Problem)`

- `Problem` - Problem object implementing `local_optimization_problem_protocol` and defining `gradient/2`.

L-BFGS (limited-memory Broyden-Fletcher-Goldfarb-Shanno) quasi-Newton local optimizer with backtracking Armijo line search. Requires the problem to define `gradient/2`. Supports optional box constraints via projection, minimization and maximization.

Availability:
`logtalk_load(local_optimization(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-03

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *local_optimization_solver(Problem)*
Uses:
linear_algebra
list

Remarks:

- Update: Instead of maintaining a dense inverse-Hessian approximation like `bfgs(_)`, only the last `memory_size(M)` step/gradient-difference pairs `(s, y)` are kept, and the search direction is recovered from them with the standard two-loop recursion (Nocedal and Wright, Algorithm 7.4). Memory and per-iteration cost are `O(M*n)` instead of `bfgs(_)`'s `O(n^2)`.
- Internal minimization form: Maximization is handled by internally minimizing the negated objective and gradient, so the two-loop recursion, curvature test, and Armijo condition are always expressed in minimization form, which avoids sign errors in the line search.
- Curvature safeguard: Whenever the curvature condition `y . s > 0` is not comfortably satisfied (possible here since the line search only enforces sufficient decrease, not a Wolfe curvature condition), the pair history is cleared and the next step falls back to steepest descent, rather than keeping a stale history that would otherwise keep producing the same near-zero-progress direction.
- Restarts: The `restart(N)` option (off by default) periodically clears the pair history, exactly as `bfgs(_)` resets its inverse-Hessian approximation to the identity.
- Bounds: When the problem defines `position_bounds/1`, trial points are projected onto the box after each step. Projection can weaken the quasi-Newton model; a pure bound-constrained formulation (L-BFGS-B style) is not implemented.

object

1.207.6 `lbfgs_b(Problem)`

- `Problem` - Problem object implementing `local_optimization_problem_protocol` with `gradient/2` (and `position_bounds/1` when box constraints are present).

L-BFGS-B bound-constrained limited-memory quasi-Newton optimizer with a level-B approximate generalized Cauchy point (first-segment quadratic min along the projected gradient path), free-set identification at the Cauchy point, feasible-step limiting, and L-BFGS two-loop recursion. Requires `gradient/2`.

Availability:

```
logtalk_load(local_optimization(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-03

Compilation flags:

```
static, context_switching_calls
```

Imports:

`public` *local_optimization_solver(Problem)*

Uses:

linear_algebra
list

Remarks:

- Algorithm: Each iteration (1) builds an approximate generalized Cauchy point by minimizing a quadratic model of the limited-memory BFGS Hessian along the first segment of the projected steepest-descent path, (2) identifies the free set at that point, (3) computes an L-BFGS direction via the two-loop recursion and zeroes components outside the free set or that would leave the box, (4) uses the largest feasible step as the Armijo upper bound, and (5) updates the pair history only when the curvature condition holds.
- Approximate GCP: Level-B approximation: breakpoints along `x(t) = P(x - t g)`, univariate quadratic minimization on `[0, t1]` (first breakpoint), with curvature `d'Bd` estimated from the most recent L-BFGS pair (`gamma`). Full multi-segment BLNZ Cauchy search is not implemented.
- Versus `lbfgs(_)`: Plain `lbfgs(_)` only clamps trial points after an unconstrained step. This solver never proposes an infeasible step, stops on the projected gradient norm, and chooses the free set from an approximate Cauchy point.
- Internal minimization form: Maximization is handled by minimizing the negated objective and gradient (phi-space), as in `bfgs(_)` and `lbfgs(_)`.
- Unbounded problems: When the problem does not define `position_bounds/1`, the solver behaves like unconstrained `lbfgs(_)` (no GCP / free-set masking). Prefer `lbfgs(_)` for purely unconstrained work; prefer this solver when box constraints are present.

Public predicates

initial_point/1

Returns a starting point for the local search. The point must be a non-empty list of numbers. When position bounds are defined, the point must lie inside those bounds.

Compilation flags:

```
static
```

Template:

```
initial_point(Point)
```

Mode and number of proofs:

```
initial_point(-list(number)) - one
```

---

objective/2

Computes the objective (cost) value of a point. Solvers minimize this value by default; use the `objective(maximize)` option to maximize it instead. The returned value must be a number.

Compilation flags:

```
static
```

Template:

```
objective(Point,Value)
```

Mode and number of proofs:

```
objective(+list(number),-number) - one
```

---

gradient/2

Optional. Computes the gradient of the objective at a point. Required by gradient-based solvers (gradient descent, conjugate gradient, BFGS, …). When not defined those solvers raise an existence error. The returned vector must have the same length as the point.

Compilation flags:

```
static
```

Template:

```
gradient(Point,Gradient)
```

Mode and number of proofs:

```
gradient(+list(number),-list(number)) - zero_or_one
```

---

hessian/2

Optional for most solvers. Computes the Hessian matrix of the objective at a point (list of rows). Required by trust-region Newton-CG; when not defined that solver raises an existence error. Not used by any other solver.

Compilation flags:

```
static
```

Template:

```
hessian(Point,Hessian)
```

Mode and number of proofs:

```
hessian(+list(number),-list(list(number))) - zero_or_one
```

---

position_bounds/1

Optional. Returns one `Lower-Upper` numeric bound pair per dimension, with `Lower =< Upper`. When defined, solvers that support bounds project or clamp trial points onto the box. When not defined the search is treated as unbounded.

Compilation flags:

```
static
```

Template:

```
position_bounds(Bounds)
```

Mode and number of proofs:

```
position_bounds(-list(pair)) - zero_or_one
```

---

stop_condition/3

Optional. True when the search should stop given the completed iteration count, the current best point, and its objective value. When not defined the solver runs until its own termination criteria (maximum iterations, tolerances, …) are met.

Compilation flags:

```
static
```

Template:

```
stop_condition(Iteration,BestPoint,BestValue)
```

Mode and number of proofs:

```
stop_condition(+non_negative_integer,+list(number),+number) - zero_or_one
```

`progress/5`

Optional. Called periodically to report progress. Arguments are the completed iteration count, current best point, best objective value, a solver-specific measure of step size or gradient norm, and the number of objective evaluations so far. A final call is made when the solver terminates if progress reporting is enabled.

Compilation flags:
`static`

Template:
`progress(Iteration,BestPoint,BestValue,Measure,Evaluations)`

Mode and number of proofs:
`progress(+non_negative_integer,+list(number),+number,+number,+number)` - `zero_or_one`

Public predicates

run/2

Runs the solver with default options and returns the best point and objective value found.

Compilation flags:
`static`

Template:
`run(BestPoint,BestValue)`
Mode and number of proofs:
`run(-list(number),-number)` - `one`

run/3

Runs the solver with the given options and returns the best point and objective value found.

Compilation flags:
`static`

Template:
`run(BestPoint,BestValue,Options)`
Mode and number of proofs:
`run(-list(number),-number,+list(compound))` - `one`

---

run/4

Runs the solver with the given options and returns the best point, objective value, and run statistics.

Compilation flags:
`static`

Template:
`run(BestPoint,BestValue,Statistics,Options)`
Mode and number of proofs:
`run(-list(number),-number,-list(compound),+list(compound))` - `one`

Protected predicates

initial_point/2

Returns the initial point defined by the `initial_point/1` option if present. Otherwise returns the problem defined initial point.

Compilation flags:
`static`

Template:
`initial_point(Options,Point)`
Mode and number of proofs:
`initial_point(+list(compound),-list(number))` - `one`

---

better_value/3

True when `Value` is strictly better than `Reference` according to the optimization direction.

Compilation flags:
`static`

Template:
`better_value(Objective,Value,Reference)`
Mode and number of proofs:
`better_value(+atom,+number,+number)` - `zero_or_one`

---

target_reached/3

True when the current value has reached or passed the optional target in the selected direction.

Compilation flags:
`static`

Template:
`target_reached(Objective,Value,Target)`
Mode and number of proofs:
`target_reached(+atom,+number,+term)` - `zero_or_one`

---

project_to_bounds/3

Clamps each component of a point to the corresponding `Low-High` interval. When `Bounds` is empty the point is returned unchanged.

Compilation flags:
`static`

Template:
`project_to_bounds(Point,Bounds,Projected)`
Mode and number of proofs:
`project_to_bounds(+list(number),+list(pair),-list(number))` - `one`

---

check_bounds/1

Checks that the bounds are valid.

Compilation flags:
`static`

Template:
`check_bounds(Bounds)`
Mode and number of proofs:
`check_bounds(+list(pair))` - `one_or_error`

Exceptions:
`Bounds` is a variable:
`instantiation_error`
`Bounds` is neither a variable nor a valid list of bounds:
`domain_error(position_bounds,Bounds)`

---

check_point/2

Checks that the bounds are valid. Assumes `Point` is already checked to be a list of numbers.

Compilation flags:
`static`

Template:
`check_point(Point,Bounds)`
Mode and number of proofs:
`check_point(+list(number),+list(pair))` - `one_or_error`

Exceptions:
`Point` is not a valid point:
`domain_error(initial_point,Point)`

---

report_progress/6

Reports solver progress by calling `progress_hook/5` if defined.

Compilation flags:
`static`

Template:
`report_progress(Iteration,UpdateInterval,BestPoint,BestValue,Measure,Evaluations)`
Mode and number of proofs:

```
report_progress(+non_negative_integer,+non_negative_integer,+list(number),
+number,+number,+non_negative_integer) - one
```

---

report_final/5

Reports the final solver solution by calling `progress_hook/5` if defined.

Compilation flags:

```
static
```

Template:

```
report_final(Iteration,UpdateInterval,BestPoint,BestValue,Measure)
```

Mode and number of proofs:

```
report_final(+non_negative_integer,+non_negative_integer,+list(number),+number,
+number) - one
```

---

progress_hook/5

User-defined hook predicate to report a solver step.

Compilation flags:

```
static
```

Template:

```
progress_hook(Iteration,BestPoint,BestValue,Measure,Evaluations)
```

Mode and number of proofs:

```
progress_hook(+non_negative_integer,+list(number),+number,+number,
+non_negative_integer) - zero_or_one
```

local_optimization_problem_protocol

object

1.207.9 nelder_mead(Problem)

- Problem - Problem object implementing local_optimization_problem_protocol.

Nelder-Mead (downhill simplex) derivative-free local optimizer for continuous problems. Supports optional box constraints via projection, minimization and maximization, and the standard reflection / expansion / contraction / shrink operators.

Availability:

logtalk_load(local_optimization(loader))

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-03

Compilation flags:

static, context_switching_calls

Imports:

public *local_optimization_solver(Problem)*

Uses:

linear_algebra
list
pairs

Remarks:

- Algorithm: Classic Nelder-Mead simplex method. An optional adaptive-parameter variant (Gao-Han) can be selected with the adaptive(true) option.
- Bounds: When the problem defines position_bounds/1, trial points are projected onto the box after every operator.
- Initial simplex: Built from the problem initial_point/1 by stepping along each coordinate axis. The step size is controlled by the initial_step(S) option (default 0.05 of each finite range, or an absolute 0.05 when unbounded).

Inherited public predicates:

local_optimization_problem_protocol, *local_optimization_solver(Problem)*, *gradient_descent(Problem)*

object

1.207.10 `trust_region_newton_cg(Problem)`

- `Problem` - Problem object implementing `local_optimization_problem_protocol` and defining `gradient/2` and `hessian/2`.

Trust-region Newton-CG local optimizer (Steihaug-CG for the subproblem). Requires the problem to define `gradient/2` and `hessian/2`. Supports optional box constraints via projection, minimization and maximization.

Availability:
`logtalk_load(local_optimization(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-24

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *local_optimization_solver(Problem)*

Uses:
linear_algebra
list

Remarks:

- Subproblem: At each outer iteration, the step is obtained by approximately minimizing the local quadratic model within a ball of radius `trust_radius`, using the Steihaug-CG method (Nocedal and Wright, Algorithm 7.2): plain conjugate gradient on the model, terminated early either by a negative-curvature direction or by reaching the trust-region boundary, in which case the step is extended to the boundary along the current CG direction.
- No line search: Unlike the other gradient-based solvers in this library, this solver never backtracks a step size; the trust-region radius itself is grown or shrunk each iteration based on how well the quadratic model predicted the actual objective change, and a step is accepted only when that agreement is good enough.

- Internal minimization form: Maximization is handled by internally minimizing the negated objective, gradient, and Hessian, so the subproblem and acceptance test are always expressed in minimization form, which avoids sign errors.
- Convergence: Because it uses exact second-order information, this solver typically converges in far fewer iterations than `gradient_descent(_)`, `bfgs(_)`, or `lbfgs(_)` on well-behaved problems, at the cost of requiring an explicit `hessian/2`.
- Bounds: When the problem defines `position_bounds/1`, trial points are projected onto the box after each step. Projection can weaken the trust-region model agreement (the accepted step may differ from the one the subproblem solved for), which can trigger more radius shrinkage than an unconstrained problem would; a pure bound-constrained formulation is not implemented.

log_file/2

Access to the table of log files.

Compilation flags:
`static`

Template:
`log_file(Alias,File)`
Mode and number of proofs:
`log_file(?atom,?atom)` - `zero_or_more`

define_log_file/2

Defines a log file with alias Alias and file name File. If the log file already exists, its contents are kept. Logging is enabled by default.

Compilation flags:
```
static
```

Template:
```
define_log_file(Alias,File)
```
Mode and number of proofs:
```
define_log_file(+atom,+atom) - one
```

---

init_log_file/2

Initializes a new log file with alias Alias and file name File. If the log file already exists, its contents are erased. Logging is enabled by default.

Compilation flags:
```
static
```

Template:
```
init_log_file(Alias,File)
```
Mode and number of proofs:
```
init_log_file(+atom,+atom) - one
```

---

log_event/2

Logs an event Event to a log file with alias Alias. Fails if a log file with alias Alias is not defined.

Compilation flags:
```
static
```

Template:
```
log_event(Alias,Event)
```
Mode and number of proofs:
```
log_event(+atom,+nonvar) - zero_or_one
```

---

logging/1

True if logging to file with alias Alias is enabled.

Compilation flags:
`static`

Template:
`logging(Alias)`
Mode and number of proofs:
`logging(+atom)` - `zero_or_one`

---

enable_logging/1

Enables logging to file with alias Alias. Fails if a log file with alias Alias is not defined.

Compilation flags:
`static`

Template:
`enable_logging(Alias)`
Mode and number of proofs:
`enable_logging(+atom)` - `zero_or_one`

---

disable_logging/1

Disables logging to file with alias Alias. Fails if a log file with alias Alias is not defined.

Compilation flags:
`static`

Template:
`disable_logging(Alias)`
Mode and number of proofs:
`disable_logging(+atom)` - `zero_or_one`

whiledo/2

While `Condition` is true do `Action`.

Compilation flags:
`static`

Template:
`whiledo(Condition,Action)`
Meta-predicate template:
`whiledo(0,0)`
Mode and number of proofs:
`whiledo(+callable,@callable)` - `zero_or_one`

---

dowhile/2

Do `Action` while `Condition` is true.

Compilation flags:
`static`

Template:
`dowhile(Action,Condition)`
Meta-predicate template:
`dowhile(0,0)`

Mode and number of proofs:
`dowhile(@callable,+callable)` - `zero_or_one`

---

foreach/3

For each `Element` in `List` call `Goal`.

Compilation flags:
`static`

Template:
`foreach(Element,List,Goal)`
Meta-predicate template:
`foreach(*,*,0)`
Mode and number of proofs:
`foreach(@var,+list(term),@callable)` - `zero_or_one`

---

foreach/4

For each `Element` in `List` at position `Index` call `Goal`. `Index` starts at 1.

Compilation flags:
`static`

Template:
`foreach(Element,Index,List,Goal)`
Meta-predicate template:
`foreach(*,*,*,0)`
Mode and number of proofs:
`foreach(@var,@var,+list(term),@callable)` - `zero_or_one`

---

forto/3

Calls `Goal` counting up from `First` to `Last`. Increment is 1. For convenience, `First` and `Last` can be arithmetic expressions. Fails iff `Goal` fails.

Compilation flags:
`static`

Template:
`forto(First,Last,Goal)`
Meta-predicate template:

```
forto(*,*,0)
```

Mode and number of proofs:

```
forto(+number,+number,@callable) - zero_or_one
```

---

forto/4

Calls `Goal` counting up from `First` to `Last` and binding `Count` to each successive value. Increment is 1. For convenience, `First` and `Last` can be arithmetic expressions. Fails iff `Goal` fails.

Compilation flags:

```
static
```

Template:

```
forto(Count,First,Last,Goal)
```

Meta-predicate template:

```
forto(*,*,*,0)
```

Mode and number of proofs:

```
forto(@var,+number,+number,@callable) - zero_or_one
```

---

forto/5

Calls `Goal` counting up from `First` to `Last` and binding `Count` to each successive value. For convenience, `First`, `Last`, and `Increment` can be arithmetic expressions (uses `Increment` absolute value). Fails iff `Goal` fails.

Compilation flags:

```
static
```

Template:

```
forto(Count,First,Last,Increment,Goal)
```

Meta-predicate template:

```
forto(*,*,*,*,0)
```

Mode and number of proofs:

```
forto(@var,+number,+number,+number,@callable) - zero_or_one
```

---

fordownto/3

Calls `Goal` counting down from `First` to `Last`. Decrement is 1. For convenience, `First` and `Last` can be arithmetic expressions. Fails iff `Goal` fails.

Compilation flags:

```
static
```

Template:

```
fordownto(First,Last,Goal)
```

Meta-predicate template:

```
fordownto(*,*,0)
```

Mode and number of proofs:

```
fordownto(+number,+number,@callable) - zero_or_one
```

---

fordownto/4

Calls `Goal` counting down from `First` to `Last` and binding `Count` to each successive value. Decrement is 1. For convenience, `First` and `Last` can be arithmetic expressions. Fails iff `Goal` fails.

Compilation flags:

```
static
```

Template:

```
fordownto(Count,First,Last,Goal)
```

Meta-predicate template:

```
fordownto(*,*,*,0)
```

Mode and number of proofs:

```
fordownto(@var,+number,+number,@callable) - zero_or_one
```

---

fordownto/5

Calls `Goal` counting down from `First` to `Last` and binding `Count` to each successive value. For convenience, `First`, `Last`, and `Decrement` can be arithmetic expressions (uses `Decrement` absolute value). Fails iff `Goal` fails.

Compilation flags:

```
static
```

Template:

```
fordownto(Count,First,Last,Decrement,Goal)
```

Meta-predicate template:

```
fordownto(*,*,*,*,0)
```

Mode and number of proofs:

```
fordownto(@var,+number,+number,+number,@callable) - zero_or_one
```

Public predicates

new/2

Creates a new empty cache with the given maximum capacity.

Compilation flags:

`static`

Template:

`new(Capacity,Cache)`

Mode and number of proofs:

`new(+non_negative_integer,-cache)` - `one_or_error`

Exceptions:

`Capacity` is a variable:

`instantiation_error`

`Capacity` is neither a variable nor an integer:

`type_error(integer,Capacity)`

`Capacity` is an integer but is less than zero:

`domain_error(non_negative_integer,Capacity)`

capacity/2

Returns the maximum cache capacity.

Compilation flags:
```
static
```

Template:
```
capacity(Cache,Capacity)
```
Mode and number of proofs:
```
capacity(+cache,-non_negative_integer) - one
```

---

size/2

Returns the number of entries in the cache.

Compilation flags:
```
static
```

Template:
```
size(Cache,Size)
```
Mode and number of proofs:
```
size(+cache,-non_negative_integer) - one
```

---

empty/1

True iff the cache is empty.

Compilation flags:
```
static
```

Template:
```
empty(Cache)
```
Mode and number of proofs:
```
empty(+cache) - zero_or_one
```

---

lookup/3

Looks up a matching key-value pair without changing its recency. Fails if the key is not found or the value does not unify.

Compilation flags:
`static`

Template:
`lookup(Key,Value,Cache)`
Mode and number of proofs:
`lookup(+ground,?term,+cache)` - `zero_or_one_or_error`

Exceptions:
`Key` is not a ground term:
`instantiation_error`

---

get/4

Looks up a matching key-value pair and marks it as most recently used, returning the updated cache. Fails if the key is not found or the value does not unify.

Compilation flags:
`static`

Template:
`get(Key,Value,Cache,NewCache)`
Mode and number of proofs:
`get(+ground,?term,+cache,-cache)` - `zero_or_one_or_error`

Exceptions:
`Key` is not a ground term:
`instantiation_error`

---

put/4

Inserts or replaces a key-value pair, marks it as most recently used, and evicts the least recently used entry when necessary.

Compilation flags:
`static`

Template:
`put(Key,Value,Cache,NewCache)`
Mode and number of proofs:
`put(+ground,+term,+cache,-cache)` - `one_or_error`

Exceptions:
`Key` is not a ground term:
`instantiation_error`

---

update/5

Updates an existing matching key-value pair and marks it as most recently used. Fails if the key is not found or the old value does not unify.

Compilation flags:
`static`

Template:
`update(Key,OldValue,NewValue,Cache,NewCache)`
Mode and number of proofs:
`update(+ground,?term,+term,+cache,-cache)` - `zero_or_one_or_error`

Exceptions:
`Key` is not a ground term:
`instantiation_error`

---

delete/4

Deletes a matching key-value pair, returning the updated cache. Fails if the key is not found or the value does not unify.

Compilation flags:
`static`

Template:
`delete(Key,Value,Cache,NewCache)`
Mode and number of proofs:
`delete(+ground,?term,+cache,-cache)` - `zero_or_one_or_error`

Exceptions:
`Key` is not a ground term:
`instantiation_error`

---

evict/3

Evicts and returns the least recently used key-value pair. Fails if the cache is empty.

Compilation flags:
`static`

Template:
`evict(Cache,Pair,NewCache)`
Mode and number of proofs:
`evict(+cache,-pair,-cache)` - `zero_or_one`

---

as_list/2

Returns the cache key-value pairs ordered from most recently used to least recently used.

Compilation flags:
`static`

Template:
`as_list(Cache,Pairs)`
Mode and number of proofs:
`as_list(+cache,-list(pair))` - `one`

---

clear/2

Returns an empty cache with the same capacity.

Compilation flags:
`static`

Template:
`clear(Cache,EmptyCache)`
Mode and number of proofs:
`clear(+cache,-cache)` - `one`

Protected predicates

(none)

Private predicates

(none)

Operators

1.213 massey_ranker

object

1.213.1 `massey_ranker`

Massey pairwise preference ranker. Learns one deterministic rating per item from a dataset object implementing the `pairwise_ranking_dataset_protocol` protocol by solving the Massey linear system built from aggregated pairwise outcomes and returns a self-describing ranker term with diagnostics that can be used for ranking and export.

Availability:
`logtalk_load(massey_ranker(loader))`

Author: Paulo Moura
Version: 1:1:1
Date: 2026-08-18

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *ranking_dataset_common*
`public` *score_ranker_model_common*

1.214 mcp_server

protocol

1.214.1 mcp_cache_protocol

Optional protocol for per-operation cache policy used by the MCP 2026-07-28 specification. An application may implement `cache_policy/4` to choose TTL (milliseconds) and scope (`public` or `private`) for complete results of `server/discover`, list operations (`tools/list`, `prompts/list`, `resources/list`, `resources/templates/list`), and `resources/read`. Cache fields are never attached to `input_required` results or MRTR retries. When the predicate is not defined, or for an operation it does not cover, the server falls back to the options `cache_ttl(0)` and `cache_scope(private)`.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-14

Compilation flags:
`static`

Dependencies:
(none)

Remarks:

- TTL: A non-negative integer number of milliseconds. `0` means the result must not be cached.
- Scope: Either `public` (may be shared across clients) or `private` (client-specific).
- Applicability: Only complete final results of discover, list, and resource-read operations receive cache fields. Tool calls, prompt gets that return `input_required`, and any MRTR continuation never include `ttlMs` / `cacheScope`.

Inherited public predicates:
(none)

- *Public predicates*
  - *cache_policy/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

cache_policy/4

Returns the cache policy for a given operation and request. `Operation` is one of `discover`, `tools_list`, `prompts_list`, `resources_list`, `resources_templates_list`, or `resources_read`. `Request` is the request-specific identifier or arguments (e.g. a resource URI for `resources_read`, or a free term for list/discover). `TTL` is a non-negative integer (milliseconds). `Scope` is `public` or `private`. Failure means the server should use its configured defaults.

Compilation flags:
`static`

Template:
`cache_policy(Operation,Request,TTL,Scope)`
Mode and number of proofs:
`cache_policy(+atom,+term,-integer,-atom)` - `zero_or_one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
protocol

1.214.2 mcp_completion_protocol

Protocol for Logtalk objects that provide MCP prompt argument and resource URI completions. Used by the 2025-06-18, 2025-11-25, and 2026-07-28 adapters.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-02

Compilation flags:
`static`

Dependencies:
(none)

Remarks:

- Capabilities: Objects providing completions must declare `completions` in their `capabilities/1` predicate (from the `mcp_tool_protocol` protocol).
- References: The reference is either `prompt(Name)` for a declared prompt or `resource(URI)` for a declared resource URI or URI template.
- Results: The result is `completion(Values)` or `completion(Values, Total, HasMore)`. `Values` is an application-ranked list of atoms. The server preserves the first 100 values and sets `hasMore` to true when truncation is required. `Total` is a non-negative integer and `HasMore` is `true` or `false`.

Inherited public predicates:

(none)

- *Public predicates*
  - *completion/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

completion/4

Returns completion suggestions for a prompt argument or resource URI. `Reference` is `prompt(Name)` or `resource(URI)`, `Argument` is an `ArgumentName-PartialValue` pair, `Context` is a list of previously resolved `Name-Value` argument pairs, and `Result` is `completion(Values)` or `completion(Values, Total, HasMore)`.

Compilation flags:

`static`

Template:

`completion(Reference,Argument,Context,Result)`

Mode and number of proofs:

`completion(+compound,+pair,+list(pair),--compound)` - `one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)

protocol

1.214.3 mcp_multiround_protocol

Protocol for multi-round tool/prompt/resource operations (MRTR) used by the MCP 2026-07-28 specification. Implementing objects may define the round hooks to request additional input from the client (elicitation, sampling, roots) and to resume with input responses and opaque request state. Existing applications that do not implement these hooks continue to use `tool_call/3`, `prompt_get/3`, `resource_read/3`, or auto-dispatch; the 2026 adapter wraps those results as `complete(Result)`. The 2026 adapter never invokes the 2025-06-18 `tool_call/4` elicitation API.

Availability:

(none)

Remarks:

- Request context: Each round hook receives a `request_context(ClientCapabilities, InputResponses, RequestState, Progress)` term. `ClientCapabilities` is the curly-term advertised by the client. `InputResponses` is a list of `input_response(Key, Response)` terms (or empty on the first round). `RequestState` is application-owned opaque data (or `none`). `Progress` is a callable closure for emitting progress notifications when the client supplied a progress token; it is only meaningful under the 2026 adapter.
- Complete results: A hook returns `complete(Result)` where `Result` uses the existing canonical vocabulary: `text(Atom)`, `error(Atom)`, `results(List)`, `structured(StructuredContent)`, `structured(Items, StructuredContent)` for tools; `messages(MessageList)` or `messages(Description, MessageList)` for prompts; `contents(ContentList)` for resources.
- Input-required results: A hook returns `input_required(InputRequests, RequestState)`. `InputRequests` is a nonempty list of uniquely keyed `input_request(Key, Request)` terms, and/or `RequestState` is non-`none`. An input-required result must contain a nonempty request list, non-`none` state, or both.
- Allowed request forms: `Request` may be `form_elicitation(Message, Schema)`, `url_elicitation(Message, URL)`, `sampling(Messages, ModelPreferences, SystemPrompt, IncludeContext)`, or `roots`.
- Input responses: On a subsequent round the adapter supplies `InputResponses` with the same keys. Response values are `accept(Content)`, `decline`, `cancel` (elicitation), sampling results, or roots results. Unrecognized keys are ignored. Malformed known values yield a `-32602` error. Missing required responses cause the adapter to re-issue the corresponding input requests.
- State integrity: `RequestState` is opaque to the adapter. Applications that use it for authorization or business decisions must integrity-protect, bind, and validate it themselves.

Inherited public predicates:

(none)

- *Public predicates*
  - *tool_call_round/4*
  - *prompt_get_round/4*
  - *resource_read_round/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

tool_call_round/4

Handles one round of a multi-round tool call. `Name` is the MCP tool name, `Arguments` is a list of `ArgumentName-Value` pairs, `Context` is a `request_context(ClientCapabilities, InputResponses, RequestState, Progress)` term, and `RoundResult` is unified with either `complete(Result)` or `input_required(InputRequests, RequestState)`. If not defined, the 2026 adapter falls back to `tool_call/3` (or auto-dispatch) and wraps the outcome as `complete`.

Compilation flags:

`static`

Template:

`tool_call_round(Name,Arguments,Context,RoundResult)`

Mode and number of proofs:

`tool_call_round(+atom,+list(pair),+compound,--compound)` - `zero_or_one`

---

prompt_get_round/4

Handles one round of a multi-round prompt get. `Name` is the MCP prompt name, `Arguments` is a list of `ArgumentName-Value` pairs, `Context` is a `request_context/4` term, and `RoundResult` is unified with either `complete(Result)` or `input_required(InputRequests, RequestState)`. If not defined, the 2026 adapter falls back to `prompt_get/3` and wraps the outcome as `complete`.

Compilation flags:

`static`

Template:

`prompt_get_round(Name,Arguments,Context,RoundResult)`

Mode and number of proofs:

`prompt_get_round(+atom,+list(pair),+compound,--compound)` - `zero_or_one`

---

resource_read_round/4

Handles one round of a multi-round resource read. `URI` is the resource identifier, `Arguments` is a list of `ArgumentName-Value` pairs (currently unused by most applications), `Context` is a `request_context/4` term, and `RoundResult` is unified with either `complete(Result)` or `input_required(InputRequests, RequestState)`. If not defined, the 2026 adapter falls back to `resource_read/3` and wraps the outcome as `complete`.

Compilation flags:
`static`

Template:
`resource_read_round(URI,Arguments,Context,RoundResult)`
Mode and number of proofs:
`resource_read_round(+atom,+list(pair),+compound,--compound)` - `zero_or_one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
protocol

1.214.4 mcp_prompt_protocol

Protocol for Logtalk objects that provide prompts to be exposed via an MCP (Model Context Protocol) server. Implementing objects must define the set of prompts available and handle prompt get requests. Prompts are templates for structured LLM interactions that can accept arguments to customize their behavior. Used by both the 2025-06-18 and 2026-07-28 adapters.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-14

Compilation flags:
`static`

Dependencies:
(none)

Remarks:

- Capabilities: Objects providing prompts must declare `prompts` in their `capabilities/1` predicate (from the `mcp_tool_protocol` protocol). The server will then advertise the `prompts` capability and handle `prompts/list` and `prompts/get` requests.
- Prompt descriptors: Each prompt is described by a `prompt(Name, Description, Arguments)` or `prompt(Name, Title, Description, Arguments)` term where `Name` is an atom, `Title` is an optional human-friendly display name (an atom), `Description` is a human-readable atom, and `Arguments` is a list of `argument(ArgName, ArgDescription, Required)` terms.
- Prompt messages: The `prompt_get/3` predicate must return a result term containing a list of messages. Each message is a `message(Role, Content)` term where `Role` is `user` or `assistant` and `Content` is `text(Text)` where `Text` is an atom.
- Multi-round (2026-07-28): For the 2026-07-28 adapter, applications that need additional input during a prompt get implement `prompt_get_round/4` from the `mcp_multiround_protocol`. Existing `prompt_get/3` remains valid and is wrapped as a `complete` result when the round hook is absent.

Inherited public predicates:

(none)

- *Public predicates*
  - *prompts/1*
  - *prompt_get/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

prompts/1

Returns a list of prompt descriptors available from this object. Each descriptor is a compound term `prompt(Name, Description, Arguments)` or `prompt(Name, Title, Description, Arguments)` where `Name` is the MCP prompt name (an atom), `Title` is an optional human-friendly display name (an atom), `Description` is a human-readable description (an atom), and `Arguments` is a list of `argument(ArgName, ArgDescription, Required)` terms describing the prompt arguments. `ArgName` and `ArgDescription` are atoms, and `Required` is the boolean `true` or `false`.

Compilation flags:

`static`

Template:

`prompts(Prompts)`

Mode and number of proofs:

`prompts(-list(compound))` - `one`

prompt_get/3

Handles a prompt get request. `Name` is the MCP prompt name (as declared in `prompts/1`), `Arguments` is a list of `ArgumentName-Value` pairs provided by the client, and `Result` is unified with the prompt result. The result must be one of: `messages(MessageList)` for a list of prompt messages, or `messages(Description, MessageList)` to also include a description. Each message in the list must be a `message(Role, Content)` term where `Role` is `user` or `assistant` and `Content` is `text(Text)` where `Text` is an atom.

Compilation flags:
`static`

Template:
`prompt_get(Name,Arguments,Result)`
Mode and number of proofs:
`prompt_get(+atom,+list(pair),--compound)` - `one`

Protected predicates

protocol

1.214.5 mcp_resource_protocol

Protocol for Logtalk objects that provide resources to be exposed via an MCP (Model Context Protocol) server. Implementing objects must define the set of resources available and handle resource read requests. Applications may also expose parameterized resources using URI templates. Resources expose data and content from the application that MCP clients can access. Used by both the 2025-06-18 and 2026-07-28 adapters.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-02

Compilation flags:
`static`

Dependencies:
(none)

Remarks:

- Capabilities: Objects providing resources must declare `resources` in their `capabilities/1` predicate (from the `mcp_tool_protocol` protocol). The server will then advertise the `resources` capability and handle `resources/list`, `resources/templates/list`, and `resources/read` requests.
- Resource descriptors: Each resource is described by a `resource(URI, Name, Description, MimeType)` or `resource(URI, Name, Title, Description, MimeType)` term where `URI` is the resource identifier (an atom), `Name` is a human-readable name (an atom), `Title` is an optional human-friendly display name (an atom), `Description` is a human-readable description (an atom), and `MimeType` is the MIME type of the resource content (an atom, e.g. `'text/plain'`).
- Resource template descriptors: Parameterized resources are optionally described by `resource_template(URITemplate, Name, Description, MimeType)` or `resource_template(URITemplate, Name, Title, Description, MimeType)` terms. `URITemplate` is an RFC 6570 URI template atom. Template listing is validated as a whole: an invalid template raises a `domain_error(uri_template, URITemplate)` error and no partial list is advertised. The server advertises valid templates without expanding them; applications validate, authorize, and read concrete expanded URIs using `resource_read/3`.
- Resource contents: The `resource_read/3` predicate must return a result term. The result must be `contents(ContentList)` where each item is `text_content(URI, MimeType, Text)` for text resources or `blob_content(URI, MimeType, Base64Data)` for binary resources encoded as base64.
- Multi-round (2026-07-28): For the 2026-07-28 adapter, applications that need additional input during a resource read implement `resource_read_round/4` from the `mcp_multiround_protocol`. Existing `resource_read/3` remains valid and is wrapped as a `complete` result when the round hook is absent.
- Caching (2026-07-28): Complete `resources/read` results may include cache fields (`ttlMs`, `cacheScope`) derived from `mcp_cache_protocol` or server options. Cache fields are never attached to `input_required` results.

Inherited public predicates:

(none)

- *Public predicates*
  - *resources/1*
  - *resource_templates/1*
  - *resource_read/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

resources/1

Returns a list of resource descriptors available from this object. Each descriptor is a compound term `resource(URI, Name, Description, MimeType)` or `resource(URI, Name, Title, Description, MimeType)` where `URI` is the resource identifier (an atom, typically a URI like `logtalk://my-app/data`), `Name` is a human-readable name (an atom), `Title` is an optional human-friendly display name (an atom), `Description` is a human-readable description (an atom), and `MimeType` is the MIME type (an atom, e.g. `'text/plain'`, `'application/json'`).

Compilation flags:

`static`

Template:

`resources(Resources)`

Mode and number of proofs:

`resources(-list(compound))` - `one`

`resource_templates/1`

Optional. Returns a list of parameterized resource descriptors. Each descriptor is a `resource_template(URITemplate, Name, Description, MimeType)` or `resource_template(URITemplate, Name, Title, Description, MimeType)` term. `URITemplate` is an RFC 6570 URI template atom. Concrete expanded URIs are handled by `resource_read/3`.

Compilation flags:

`static`

Template:

`resource_templates(ResourceTemplates)`

Mode and number of proofs:

`resource_templates(-list(compound))` - `zero_or_one`

`resource_read/3`

Handles a resource read request. `URI` is the resource identifier (as declared in `resources/1`), `Arguments` is a list of `ArgumentName-Value` pairs (currently unused but reserved for future use), and `Result` is unified with the resource result. The result must be `contents(ContentList)` where each content item is either `text_content(URI, MimeType, Text)` for text resources or `blob_content(URI, MimeType, Base64Data)` for binary resources encoded as base64. `Text` and `Base64Data` must be atoms.

Compilation flags:

`static`

Template:

`resource_read(URI,Arguments,Result)`

Mode and number of proofs:

`resource_read(+atom,+list(pair),--compound)` - `one`

1.214.6 `mcp_server`

MCP server facade. Selects spec and transport (stdio or Streamable HTTP).

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 2:0:0
Date: 2026-09-02

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *options*
Uses:
http_server
list
type

Remarks:

- Specs: `'2025-06-18'` (default), `'2025-11-25'`, and `'2026-07-28'` via `spec/1`.
- Transports: `stdio` (default) and `streamable_http` via `transport/1`.
- OAuth: Streamable HTTP servers can be protected using the `oauth/4` option.

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

Public predicates

start/2

Starts the MCP server with default options.

Compilation flags:
`static`

Template:
`start(Name,Application)`
Mode and number of proofs:
`start(+atom,+object_identifier)` - `one`

---

start/3

Starts the MCP server with options (`spec/1`, `transport/1`, HTTP options, …).

Compilation flags:
`static`

Template:
`start(Name,Application,Options)`
Mode and number of proofs:
`start(+atom,+object_identifier,+list)` - `one_or_error`

Exceptions:
The `Options` list specifies an invalid MCP server configuration:
`domain_error(mcp_server_configuration,Version-Transport)`

---

start/4

Starts with custom streams and default options.

Compilation flags:
`static`

Template:
`start(Name,Application,Input,Output)`
Mode and number of proofs:
`start(+atom,+object_identifier,+stream,+stream)` - `one`

---

start/5

Starts with custom streams and options.

Compilation flags:
`static`

Template:
`start(Name,Application,Input,Output,Options)`
Mode and number of proofs:
`start(+atom,+object_identifier,+stream,+stream,+list)` - `one_or_error`

Exceptions:
The `Options` list specifies a unsupported MCP server configuration:
`domain_error(mcp_server_configuration,Version-Transport)`

---

notify/1

Publishes an application event to the active adapter.

Compilation flags:
`static`

Template:
`notify(Event)`
Mode and number of proofs:
`notify(+compound)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

active_transport_object_/1

Currently active transport object.

Compilation flags:
`dynamic`

Template:
`active_transport_object_(TransportObject)`
Mode and number of proofs:
`active_transport_object_(?object_identifier)` - `zero_or_one`

Operators

(none)
object

1.214.7 mcp_server_2025_06_18_spec

MCP 2025-06-18 protocol handler. Transport-agnostic message handling; returns abstract outcomes for stdio or Streamable HTTP transports to render. Synchronous elicitation requires `stdio_input/1` and `stdio_output/1` options.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-02

Public predicates

supported_specs/1

Specs this handler can negotiate, preferred first.

Compilation flags:
`static`

Template:
`supported_specs(Versions)`
Mode and number of proofs:
`supported_specs(-list)` - `one`

---

current_options/1

Merged options established by prepare/2.

Compilation flags:
`static`

Template:
`current_options(Options)`
Mode and number of proofs:
`current_options(-list)` - `zero_or_one`

---

elicit_request/5

Sends an elicitation/create request to the client and reads the response (2025-06-18 synchronous model).

Compilation flags:
`static`

Template:
`elicit_request(Input,Output,Message,RequestedSchema,Answer)`
Mode and number of proofs:
`elicit_request(+stream,+stream,+atom,+compound,--compound)` - `one`

Protected predicates

handle_initialize/4

Handles the `initialize` request and returns a `reply/1` outcome. Overridable by later 2025 family specs (e.g. 2025-11-25).

Compilation flags:
`static`

Template:
`handle_initialize(Message,Id,Options,Outcome)`
Mode and number of proofs:
`handle_initialize(+nonvar,+nonvar,+list,-nonvar)` - `one`

---

handle_ping/2

Handles the `ping` request and returns a `reply/1` outcome.

Compilation flags:
`static`

Template:
`handle_ping(Id,Outcome)`
Mode and number of proofs:
`handle_ping(+nonvar,-nonvar)` - `one`

---

handle_tools_list/3

Handles the `tools/list` request. Overridable so later specs can enrich tool descriptors (e.g. icons).

Compilation flags:
`static`

Template:
`handle_tools_list(Id,Options,Outcome)`
Mode and number of proofs:
`handle_tools_list(+nonvar,+list,-nonvar) - one`

---

handle_tools_call/4

Handles the `tools/call` request and returns a `reply/1` outcome.

Compilation flags:
`static`

Template:
`handle_tools_call(Message,Id,Options,Outcome)`
Mode and number of proofs:
`handle_tools_call(+nonvar,+nonvar,+list,-nonvar) - one`

---

handle_prompts_list/3

Handles the `prompts/list` request. Overridable so later specs can enrich prompt descriptors (e.g. icons).

Compilation flags:
`static`

Template:
`handle_prompts_list(Id,Options,Outcome)`
Mode and number of proofs:
`handle_prompts_list(+nonvar,+list,-nonvar) - one`

---

handle_prompts_get/4

Handles the `prompts/get` request and returns a `reply/1` outcome.

Compilation flags:
`static`

Template:
`handle_prompts_get(Message,Id,Options,Outcome)`
Mode and number of proofs:
`handle_prompts_get(+nonvar,+nonvar,+list,-nonvar)` - `one`

---

handle_completion_complete/4

Handles the `completion/complete` request and returns a `reply/1` outcome.

Compilation flags:
`static`

Template:
`handle_completion_complete(Message,Id,Options,Outcome)`
Mode and number of proofs:
`handle_completion_complete(+nonvar,+nonvar,+list,-nonvar)` - `one`

---

handle_resources_list/3

Handles the `resources/list` request. Overridable so later specs can enrich resource descriptors (e.g. icons).

Compilation flags:
`static`

Template:
`handle_resources_list(Id,Options,Outcome)`
Mode and number of proofs:
`handle_resources_list(+nonvar,+list,-nonvar)` - `one`

---

handle_resources_templates_list/3

Handles the `resources/templates/list` request. Overridable so later specs can enrich resource template descriptors (e.g. icons).

Compilation flags:

`static`

Template:

`handle_resources_templates_list(Id,Options,Outcome)`

Mode and number of proofs:

`handle_resources_templates_list(+nonvar,+list,-nonvar)` - `one`

---

handle_resources_read/4

Handles the `resources/read` request and returns a `reply/1` outcome.

Compilation flags:

`static`

Template:

`handle_resources_read(Message,Id,Options,Outcome)`

Mode and number of proofs:

`handle_resources_read(+nonvar,+nonvar,+list,-nonvar)` - `one`

---

generate_elicit_id/1

Generates a new elicitation id.

Compilation flags:

`dynamic`

Template:

`generate_elicit_id(ElicitId)`

Mode and number of proofs:

`generate_elicit_id(-non_negative_integer)` - `one`

---

build_capabilities/2

Builds the server `capabilities` object from application capability atoms (tools is always present; prompts, resources, completions, and the MCP Apps UI extension are optional).

Compilation flags:
`static`

Template:
`build_capabilities(ApplicationCapabilities,Capabilities)`
Mode and number of proofs:
`build_capabilities(+list,-compound)` - `one`

---

best_supported_spec/3

Selects the highest supported spec that is less than or equal to the client-requested spec. Fails when no such spec exists.

Compilation flags:
`static`

Template:
`best_supported_spec(Supported,ClientVersion,Best)`
Mode and number of proofs:
`best_supported_spec(+list,+atom,-atom)` - `zero_or_one`

Private predicates

client_capabilities_/1

Client capabilities.

Compilation flags:
`dynamic`

Template:
`client_capabilities_(Capabilities)`
Mode and number of proofs:
`client_capabilities_(-nonvar)` - `one`

---

elicit_counter_/1

Elicitation current counter.

Compilation flags:
`dynamic`

Template:
`elicit_counter_(Counter)`
Mode and number of proofs:
`elicit_counter_(-non_negative_integer)` - `one`

---

initialized_/0

Initialization completed flag.

Compilation flags:
`dynamic`

Mode and number of proofs:
`initialized_` - `zero_or_one`

---

server_options_/1

Server options.

Compilation flags:
`dynamic`

Template:
`server_options_(Options)`
Mode and number of proofs:
`server_options_(-list(compound))` - `one`

Operators

object

1.214.8 mcp_server_2025_11_25_spec

MCP 2025-11-25 protocol handler. Extends the 2025-06-18 handler with version `2025-11-25` negotiation (still accepting `2025-06-18`), optional `serverInfo.description`, icons metadata on tools/prompts/resources (SEP-973), and URL-mode elicitation (SEP-1036). EnumSchema / ElicitResult enrichments (SEP-1330) are pass-through via application-supplied schemas. Does **not** implement sampling tool calling, experimental Tasks, or OAuth/OIDC.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-31

Compilation flags:

Public predicates

run_stdio_loop/3

Stdio read/dispatch loop. Called by the stdio transport.

Compilation flags:
```
static
```

Template:
```
run_stdio_loop(Input,Output,Options)
```
Mode and number of proofs:
```
run_stdio_loop(+stream,+stream,+list) - one
```

---

emit_progress/6

Buffers a notifications/progress event or invokes progress_hook/1 from current options.

Compilation flags:
```
static
```

Template:
```
emit_progress(Token,RequestId,Output,ProgressValue,Total,Message)
```
Mode and number of proofs:
```
emit_progress(+term,+term,+stream,+number,+number,+atom) - one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

output_stream_/1

Current output stream used for stdio rendering and subscription event fan-out.

Compilation flags:
`dynamic`

Template:
`output_stream_(Stream)`
Mode and number of proofs:
`output_stream_(-stream)` - `zero_or_one`

---

subscription_/3

Active subscription entry: identifier, opening request id, and filter list.

Compilation flags:
`dynamic`

Template:
`subscription_(SubscriptionId,RequestId,Filters)`
Mode and number of proofs:
`subscription_(-atom,-nonvar,-list)` - `zero_or_more`

---

running_/0

Flag set while the stdio server loop is active.

Compilation flags:
`dynamic`

Mode and number of proofs:
`running_` - `zero_or_one`

---

reply_outcome_/1

Buffered abstract outcome (`reply/1`, `subscribe/3`, etc.) for the current request.

Compilation flags:
`dynamic`

Template:
`reply_outcome_(Outcome)`
Mode and number of proofs:
`reply_outcome_(-nonvar)` - `zero_or_one`

---

progress_buffer_/1

Buffered `notifications/progress` events for the current request (before final reply).

Compilation flags:
`dynamic`

Template:
`progress_buffer_(Events)`
Mode and number of proofs:
`progress_buffer_(-list)` - `zero_or_one`

---

current_options_/1

Merged options for the active prepare/handle session.

Compilation flags:
`dynamic`

Template:
`current_options_(Options)`
Mode and number of proofs:
`current_options_(-list)` - `zero_or_one`

Operators

category

1.214.10 mcp_server_application

Common predicates for MCP servers: tool/prompt/resource descriptor conversion, completion request handling, schema derivation from `info/2` and `mode/2` directives, auto-dispatch, canonical complete-result terms, curly-term predicates, and MCP Apps (`_meta.ui`) metadata.

Availability:
`logtalk_load(mcp_server(loader))`

Public predicates

tool_descriptors_to_json/3

Converts a list of `tool(Name, Functor, Arity)` descriptors into MCP JSON tool definitions, deriving titles, descriptions and input schemas from the application object's `info/2` and `mode/2` directives.

Compilation flags:
`static`

Template:
`tool_descriptors_to_json(ToolDescriptors,Application,JsonTools)`
Mode and number of proofs:
`tool_descriptors_to_json(+list,+object_identifier,-list)` - `one`

Protected predicates

prompt_descriptors_to_json/2

Converts prompt descriptors (3-arg or 4-arg) into MCP JSON prompt definitions.

Compilation flags:
`static`

Template:
`prompt_descriptors_to_json(PromptDescriptors,JsonPrompts)`
Mode and number of proofs:
`prompt_descriptors_to_json(+list,-list)` - `one`

---

resource_descriptors_to_json/3

Converts resource descriptors (4-arg or 5-arg) into MCP JSON resource definitions. When the application defines `resource_ui_meta/2`, attaches `_meta.ui` (MCP Apps).

Compilation flags:

```
static
```

Template:

```
resource_descriptors_to_json(Descriptors,Application,Resources)
```

Mode and number of proofs:

```
resource_descriptors_to_json(+list,+object_identifier,-list) - one
```

---

resource_template_descriptors_to_json/2

Converts resource template descriptors (4-arg or 5-arg) into MCP JSON resource template definitions. No partial list is returned when a descriptor is invalid.

Compilation flags:

```
static
```

Template:

```
resource_template_descriptors_to_json(Descriptors,ResourceTemplates)
```

Mode and number of proofs:

```
resource_template_descriptors_to_json(+list,-list) - one_or_error
```

Exceptions:

A descriptor contains an invalid RFC 6570 URI template `URITemplate`:

```
domain_error(uri_template,URITemplate)
```

---

application_resource_template_uri/2

Checks that a concrete resource URI matches the literal segments of one of the application resource templates. Full RFC 6570 expression validation and authorization remain application responsibilities.

Compilation flags:

```
static
```

Template:

```
application_resource_template_uri(Application,URI)
```

Mode and number of proofs:

```
application_resource_template_uri(+object_identifier,+atom) - zero_or_one
```

---

completion_request/5

Validates and normalizes completion request parameters. The normalized reference is `prompt(Name)` or `resource(URI)`, the argument is a `Name-PartialValue` pair, and the context is a list of prior argument pairs.

Compilation flags:
`static`

Template:
`completion_request(Application,Params,Reference,Argument,Context)`
Mode and number of proofs:
`completion_request(+object_identifier,+compound,-compound,-pair,-list)` - `zero_or_one`

---

completion_result_to_json/2

Validates and converts a completion result to its MCP JSON curly-term representation.

Compilation flags:
`static`

Template:
`completion_result_to_json(Result,JsonCompletion)`
Mode and number of proofs:
`completion_result_to_json(+compound,-compound)` - `zero_or_one`

---

auto_dispatch_tool/5

Auto-dispatches a tool call by calling the predicate on the application, collecting output-mode arguments, and returning structured output with a backwards-compatible text content item.

Compilation flags:
`static`

Template:
`auto_dispatch_tool(Application,Functor,Arity,ToolArguments,Result)`
Mode and number of proofs:
`auto_dispatch_tool(+object_identifier,+atom,+integer,+compound,-compound)` - `one`

---

try_tool_call_3/7

Tries `tool_call/3`. Falls back to auto-dispatch on failure.

Compilation flags:
`static`

Template:
`try_tool_call_3(Application,ToolName,Functor,Arity,ArgPairs,ToolArguments,Result)`
Mode and number of proofs:
`try_tool_call_3(+object_identifier,+atom,+atom,+integer,+list,+compound,-compound)` - `one`

---

tool_input_schema/4

Derives a JSON Schema curly-term for tool input arguments from the application object's `info/2` and `mode/2` directives. Used by Streamable HTTP `x-mcp-header` / `Mcp-Param-*` validation when the application does not define `input_schema/2`.

Compilation flags:
`static`

Template:
`tool_input_schema(Application,Functor,Arity,InputSchema)`
Mode and number of proofs:
`tool_input_schema(+object_identifier,+atom,+integer,-compound)` - `one`

---

tool_output_schema/4

Derives a JSON Schema curly-term for tool output arguments from the application object's `info/2` and `mode/2` directives.

Compilation flags:
`static`

Template:
`tool_output_schema(Application,Functor,Arity,OutputSchema)`
Mode and number of proofs:
`tool_output_schema(+object_identifier,+atom,+integer,-compound)` - `one`

---

format_content_items/2

Converts canonical content item terms into MCP JSON content array elements.

Compilation flags:
```
static
```

Template:
```
format_content_items(Items,Elements)
```
Mode and number of proofs:
```
format_content_items(+list,-list) - one
```

---

format_prompt_messages/2

Converts message(Role, text(Text)) terms into MCP JSON prompt message objects.

Compilation flags:
```
static
```

Template:
```
format_prompt_messages(Messages,JsonMessages)
```
Mode and number of proofs:
```
format_prompt_messages(+list,-list) - one
```

---

format_resource_contents/2

Converts text_content/3 and blob_content/3 terms into MCP JSON resource content objects.

Compilation flags:
```
static
```

Template:
```
format_resource_contents(Contents,JsonContents)
```
Mode and number of proofs:
```
format_resource_contents(+list,-list) - one
```

---

has_pair/3

Looks up a Key-Value pair inside a curly-term.

Compilation flags:
`static`

Template:
`has_pair(Curly,Key,Value)`
Mode and number of proofs:
`has_pair(+compound,+atom,?term) - zero_or_one`

---

curly_to_pairs/2

Converts a curly-term to a list of Key-Value pairs.

Compilation flags:
`static`

Template:
`curly_to_pairs(Curly,Pairs)`
Mode and number of proofs:
`curly_to_pairs(+compound,-list) - one`

---

pairs_to_curly/2

Converts a list of Key-Value pairs to a curly-term.

Compilation flags:
`static`

Template:
`pairs_to_curly(Pairs,Curly)`
Mode and number of proofs:
`pairs_to_curly(+list,-compound) - one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.214.11 `mcp_server_spec_protocol`

Protocol for MCP server spec (aka data layer) handlers independent of transport. A handler validates and dispatches JSON-RPC messages and returns abstract outcomes that a transport (stdio or Streamable HTTP) renders to the wire.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-31

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *spec/1*
  - *prepare/2*
  - *handle_message/3*
  - *notify/1*
  - *cleanup/0*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

spec/1

MCP server spec implemented by this handler (e.g. `'2025-06-18'` or `'2026-07-28'`).

Compilation flags:
`static`

Template:
`spec(Version)`
Mode and number of proofs:
`spec(-atom)` - `one`

---

prepare/2

Initializes handler state for `Application` with merged `Options`. Does not open any transport.

Compilation flags:
`static`

Template:
`prepare(Application,Options)`
Mode and number of proofs:
`prepare(+object_identifier,+list)` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

handle_message/3

Handles one JSON-RPC Message under Options and returns an Outcome for the transport to render. Outcomes include `reply(JsonRpcTerm)`, `accepted`, `no_reply`, and transport-agnostic error replies already encoded as JSON-RPC error objects inside `reply/1`.

Compilation flags:

`static`

Template:

`handle_message(Message,Options,Outcome)`

Mode and number of proofs:

`handle_message(+nonvar,+list,-nonvar)` - `one`

---

notify/1

Publishes an application event. Transports that support server-initiated notifications deliver it; others may ignore it.

Compilation flags:

`static`

Template:

`notify(Event)`

Mode and number of proofs:

`notify(+compound)` - `zero_or_one`

---

cleanup/0

Releases handler-owned dynamic state.

Compilation flags:

`static`

Mode and number of proofs:

`cleanup` - `one`

(none)
object

1.214.12 `mcp_server_stdio_transport`

Implements the stdio transport for MCP servers. Reads newline-delimited JSON-RPC from the input stream and writes responses to the output stream. Supports specs 2025-06-18, 2025-11-25, and 2026-07-28 selected via the `spec/1` option and delegated to `mcp_server_2025_06_18_spec`, `mcp_server_2025_11_25_spec`, or `mcp_server_2026_07_28_spec`.

Availability:
`logtalk_load(mcp_server(loader))`

object

1.214.13 `mcp_server_streamable_http_transport`

Implements the Streamable HTTP transport for MCP servers. Uses Logtalk `http_server::serve_until_shutdown/5` and a dedicated `http_handler_protocol` handler object. Supports specs 2025-06-18, 2025-11-25, and 2026-07-28 selected via the `spec/1` option and delegated to the matching `mcp_server_*_spec` object. Supports optional OAuth protection and protected-resource metadata publication using the `oauth/4` option. Long-lived subscriptions/listen streams emit periodic SSE comment keep-alives (`http_sse_keepalive/1`). Requires a multi-threaded backend for subscriptions/listen.

Availability:

Public predicates

prepare/2

Initializes adapter state for `Application` with `Options` without opening a listener. Used by unit tests and by embeddings by pairing with `handle_mcp_request/4` and `cleanup/0`.

Compilation flags:

`static`

Template:

`prepare(Application,Options)`

Mode and number of proofs:

`prepare(+object_identifier,+list)` - `one_or_error`

Exceptions:

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

---

attach_sse_stream/1

Registers a live output stream for incremental SSE writes. Headers must already have been written. Each `emit_progress/5` call writes and flushes immediately.

Compilation flags:

`static`

Template:

`attach_sse_stream(Stream)`

Mode and number of proofs:

`attach_sse_stream(+stream)` - `one`

---

detach_sse_stream/0

Clears any live SSE output stream registration.

Compilation flags:
`static`

Mode and number of proofs:
`detach_sse_stream` - `one`

---

sse_headers/1

HTTP headers for an SSE response body.

Compilation flags:
`static`

Template:
`sse_headers(Headers)`
Mode and number of proofs:
`sse_headers(-list)` - `one`

---

current_options/1

Unified with the options list established by `prepare/2` or `start/4`.

Compilation flags:
`static`

Template:
`current_options(Options)`
Mode and number of proofs:
`current_options(-list)` - `zero_or_one`

---

handle_mcp_request/4

Handles one MCP HTTP request. `Method` is an uppercase HTTP method atom. `Headers` is a list of `Name-Value` pairs. `Body` is the raw request body atom. `HTTPResponse` is `http_response(Status, Headers, BodyAtom)` or `http_response(already_sent, Headers, BodyAtom)`.

Compilation flags:
`static`

Template:
`handle_mcp_request(Method,Headers,Body,HTTPResponse)`
Mode and number of proofs:
`handle_mcp_request(+atom,+list,+atom,-compound)` - `one`

`emit_progress/5`

Emits a notifications/progress event. In live mode the SSE record is written and flushed immediately on the attached stream. In buffered mode the event is queued until `finalize_response/4`.

Compilation flags:
`static`

Template:
`emit_progress(Token,RequestId,ProgressValue,Total,Message)`
Mode and number of proofs:
`emit_progress(+term,+term,+number,+number,+atom)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

`running_/0`

True while the adapter has been prepared or is serving requests.

Compilation flags:
`dynamic`

Mode and number of proofs:
`running_` - `zero_or_one`

`server_options_/1`

Merged server options for the active prepare/start session.

Compilation flags:
`dynamic`

Template:
`server_options_(Options)`

Mode and number of proofs:
`server_options_(-list)` - `zero_or_one`

---

shutdown_control_/1

Token passed to `http_server::request_shutdown/1` when stopping the listener.

Compilation flags:
`dynamic`

Template:
`shutdown_control_(Control)`
Mode and number of proofs:
`shutdown_control_(-nonvar)` - `zero_or_one`

---

subscription_/4

Active subscriptions/listen registration. Synchronization uses `threaded_wait/1` and `threaded_notify/1` tagged by `SubscriptionId`.

Compilation flags:
`dynamic`

Template:
`subscription_(SubscriptionId,RequestId,Filters,Stream)`
Mode and number of proofs:
`subscription_(-atom,-nonvar,-list,-nonvar)` - `zero_or_more`

---

progress_events_/1

Buffered notifications/progress events when SSE mode is not live.

Compilation flags:
`dynamic`

Template:
`progress_events_(Events)`
Mode and number of proofs:
`progress_events_(-list)` - `zero_or_one`

---

progress_token_/1

progressToken from the current request, or none.

Compilation flags:
`dynamic`

Template:
`progress_token_(Token)`
Mode and number of proofs:
`progress_token_(-nonvar)` - `zero_or_one`

---

sse_output_/1

Live response stream for incremental SSE writes.

Compilation flags:
`dynamic`

Template:
`sse_output_(Stream)`
Mode and number of proofs:
`sse_output_(-stream)` - `zero_or_one`

---

sse_mode_/1

Current SSE delivery mode: live, buffered, or none.

Compilation flags:
`dynamic`

Template:
`sse_mode_(Mode)`
Mode and number of proofs:
`sse_mode_(-atom)` - `zero_or_one`

Operators

(none)

protocol

1.214.14 mcp_server_transport_protocol

Protocol for MCP server transports. The `mcp_server` facade object selects the transport via the `transport/1` option and delegates the server lifecycle to it.

Availability:

```
logtalk_load(mcp_server(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-31

Compilation flags:

```
static
```

Dependencies:

(none)

Remarks:

(none)

Inherited public predicates:

(none)

- *Public predicates*
  - *spec/1*
  - *start/4*
  - *notify/1*
  - *cleanup/0*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

spec/1

Returns the MCP server spec version implemented by this adapter (e.g. `'2025-06-18'` or `'2026-07-28'`).

Compilation flags:

```
static
```

Template:

`spec(Version)`

Mode and number of proofs:

`spec(-atom)` - `one`

---

start/4

Starts the adapter against the given application object, input/output streams, and normalized server configuration options. Blocks until the client disconnects (EOF) or an exit condition is reached. The adapter is responsible for all request handling, capability negotiation, and cleanup of adapter-owned state.

Compilation flags:

`static`

Template:

`start(Application,Input,Output,Options)`

Mode and number of proofs:

`start(+object_identifier,+stream,+stream,+list)` - `one_or_error`

Exceptions:

The `Options` list specifies a non-supported `Version` spec:

`domain_error(protocol_version,Version)`

---

notify/1

Publishes an application event to interested clients. Canonical event terms are `tools_list_changed`, `prompts_list_changed`, `resources_list_changed`, and `resource_updated(URI)`. The 2025-06-18 adapter may ignore or reject events not supported by that specification; the 2026-07-28 adapter filters events through active subscriptions.

Compilation flags:

`static`

Template:

`notify(Event)`

Mode and number of proofs:

`notify(+compound)` - `zero_or_one`

`cleanup/0`

Releases any adapter-owned dynamic state. Called by the facade after the server loop terminates (success, failure, exception, or EOF).

Compilation flags:
`static`

Mode and number of proofs:
`cleanup` - `one`

protocol

1.214.16 `mcp_tool_protocol`

Protocol for Logtalk objects that provide tools to be exposed via an MCP (Model Context Protocol) server. Implementing objects must define the set of tools available and handle tool calls. Tool metadata (names, titles, descriptions, input and output schemas) can be derived automatically from `info/2` and `mode/2` directives on the tool predicates, or overridden using `input_schema/2` and `output_schema/2`. Used by both the 2025-06-18 and 2026-07-28 adapters.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-02

Compilation flags:
`static`

Dependencies:

(none)

Remarks:

- Capabilities: Objects can optionally define `capabilities/1` to declare additional application features. Currently supported: `prompts`, `resources`, and `completions` (server capabilities advertised during initialization) and `elicitation` (a required client capability that allows the server to ask the user questions during tool execution under the 2025-06-18 adapter). If `capabilities/1` is not defined, only the `tools` server capability is advertised.
- Tool title: The tool title (human-friendly display name) is derived from a `title` key in the predicate `info/2` directive. If not specified, the predicate name (functor) is used as the title.
- Schemas: Input and output schemas are inferred from the tool predicate `info/2` and `mode/2` directives. Define `input_schema/2` or `output_schema/2` to override the inferred schema for a tool. Tools can return `structured(StructuredContent)` or `structured(ContentItems, StructuredContent)` results; the structured content is included in the `structuredContent` field of the tool call response alongside the `content` array.
- Resource links: Tool results can include `resource_link(URI, Name)` or `resource_link(URI, Name, Description, MimeType)` content items in `results/1` lists.
- Elicitation (2025-06-18 only): Under the 2025-06-18 adapter, tools that need user interaction during execution should define `tool_call/4` instead of `tool_call/3`. The extra argument is an elicitation closure that can be called as `call(Elicit, Message, Schema, Answer)` where `Message` is the prompt text (an atom), `Schema` is a JSON Schema curly-term for the requested input, and `Answer` is unified with `accept(Content)`, `decline`, or `cancel`. The 2026-07-28 adapter never invokes `tool_call/4`; multi-round interaction is provided by `mcp_multiround_protocol` instead.
- Multi-round (2026-07-28): For the 2026-07-28 adapter, applications that need additional input during a tool call implement `tool_call_round/4` from the `mcp_multiround_protocol`. Existing `tool_call/3` and auto-dispatch remain valid and are wrapped as `complete` results when the round hook is absent.

Inherited public predicates:

(none)

- *Public predicates*
  - *capabilities/1*
  - *tools/1*
  - *tool_call/3*
  - *tool_call/4*
  - *output_schema/2*
  - *input_schema/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

capabilities/1

Returns a list of additional MCP features used by this provider. `prompts`, `resources`, and `completions` are advertised as server capabilities. `elicitation` declares that the provider may ask the user questions and is enabled only when the client advertises the corresponding client capability. If not defined, only the `tools` server capability is advertised.

Compilation flags:

```
static
```

Template:

```
capabilities(Capabilities)
```

Mode and number of proofs:

```
capabilities(-list(atom)) - one
```

---

tools/1

Returns a list of tool descriptors available from this object. Each descriptor is a compound term `tool(Name, Functor, Arity)` where `Name` is the MCP tool name (an atom), `Functor` is the predicate functor, and `Arity` is the predicate arity. By default, the tool name is the predicate functor. Tool titles are derived from `info/2` `title` keys (falling back to the predicate name). Tool descriptions and parameter schemas are derived from the `info/2` and `mode/2` directives of the corresponding predicates.

Compilation flags:

```
static
```

Template:

```
tools(Tools)
```

Mode and number of proofs:

```
tools(-list(compound)) - one
```

---

tool_call/3

Handles a tool call. `Name` is the MCP tool name (as declared in `tools/1`), `Arguments` is a list of `ArgumentName-Value` pairs, and `Result` is unified with the tool result. The result must be one of: `text(Atom)` for a text result, `error(Atom)` for an error result, `results(List)` for a list of content items where each item is `text(Atom)`, `error(Atom)`, `resource_link(URI, Name)`, or `resource_link(URI, Name, Description, MimeType)`, `structured(StructuredContent)` for structured output with auto-generated text, or `structured(ContentItems, StructuredContent)` for structured output with explicit content items. If this predicate is not defined for a tool, the MCP server will use auto-dispatch: it calls the tool predicate as a message to the implementing object, collects output arguments, and returns them as a text result.

Compilation flags:

```
static
```

Template:

```
tool_call(Name,Arguments,Result)
```

Mode and number of proofs:

```
tool_call(+atom,+list(pair),--compound) - one
```

---

tool_call/4

Handles a tool call with elicitation support under the 2025-06-18 adapter only. Same as `tool_call/3` but receives an `Elicit` closure as the third argument. The closure can be called as `call(Elicit, Message, Schema, Answer)` where `Message` is a prompt text (an atom), `Schema` is a curly-term JSON Schema describing the requested input (e.g., `{type-object, properties-{answer-{type-string, enum-[yes, no]}}, required-[answer]}`), and `Answer` is unified with `accept(Content)` (where `Content` is the user response as a curly-term), `decline`, or `cancel`. Only available when the application declares `elicitation` in its `capabilities/1` and the client advertises elicitation support during initialization. Falls back to `tool_call/3` and then auto-dispatch if not defined. The 2026-07-28 adapter never calls this predicate; use `tool_call_round/4` from `mcp_multiround_protocol` instead.

Compilation flags:

```
static
```

Template:

```
tool_call(Name,Arguments,Elicit,Result)
```

Mode and number of proofs:

```
tool_call(+atom,+list(pair),+callable,--compound) - one
```

---

output_schema/2

Returns the JSON output schema for the given tool name. Optional; when defined, the schema overrides the one inferred from the tool predicate `info/2` and `mode/2` directives. The tool can return `structured(StructuredContent)` or `structured(ContentItems, StructuredContent)` results. The schema must be a curly-term following JSON Schema format (e.g. `{type-object, properties-{temperature-{type-number}}, required-[temperature]}`).

Compilation flags:

```
static
```

Template:

```
output_schema(Name,Schema)
```

Mode and number of proofs:

```
output_schema(+atom,-compound) - zero_or_one
```

---

input_schema/2

Returns the JSON input schema for the given tool name. Optional; when defined, the schema overrides the one inferred from the tool predicate `info/2` and `mode/2` directives. The schema must be a curly-term following JSON Schema format (e.g. `{type-object, properties-{temperature-{type-number}}, required-[temperature]}`).

Compilation flags:
`static`

Template:
`input_schema(Name,Schema)`
Mode and number of proofs:
`input_schema(+atom,-compound)` - `zero_or_one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
protocol

1.214.17 mcp_ui_protocol

Optional MCP Apps (`io.modelcontextprotocol/ui`) metadata for tools and resources. Applications that provide interactive UI resources declare `ui` in `capabilities/1` (and typically `resources`), implement `mcp_resource_protocol` for `ui://` HTML resources, and may implement these predicates to attach tool and resource UI metadata. See the https://modelcontextprotocol.io/extensions/apps/overview spec for details.

Availability:
`logtalk_load(mcp_server(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-30

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:

(none)

- *Public predicates*
  - *tool_ui/2*
  - *resource_ui_meta/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

tool_ui/2

Optional. UI metadata for a tool. `Options` is a list of `resource_uri(URI)` and/or `visibility(List)` terms. `URI` must be a `ui://` resource served by the application. `List` is a list of `model` and/or `app` (default when omitted on the wire is both). App-only tools use `visibility([app])` so hosts hide them from the model while still allowing iframe-proxied `tools/call`.

Compilation flags:

`static`

Template:

`tool_ui(ToolName,Options)`

Mode and number of proofs:

`tool_ui(?atom,-list)` - `zero_or_more`

---

resource_ui_meta/2

Optional. UI metadata for a `ui://` resource as a curly-term matching the Apps `_meta.ui` object (`csp`, `permissions`, `domain`, `prefersBorder`). Attached when serializing resource descriptors and may be used for `resources/read` content.

Compilation flags:

`static`

Template:

`resource_ui_meta(URI,Meta)`

Mode and number of proofs:

`resource_ui_meta(?atom,-compound)` - `zero_or_more`

1.215 memcached

object

1.215.1 `memcached`

Portable Memcached client implementing the text (ASCII) protocol. Uses the sockets library for TCP communication.

Availability:

```
logtalk_load(memcached(loader))
```

Author: Paulo Moura
Version: 1:1:0
Date: 2026-11-06

Compilation flags:

```
static, context_switching_calls
```

Uses:

list
socket
user

Remarks:

- Supported backends: ECLiPSe, GNU Prolog, SICStus Prolog, Shumway Prolog, SWI-Prolog, and Trealla Prolog (same as the sockets library).
- Protocol version: Implements the Memcached text (ASCII) protocol as documented in the official protocol.txt specification.
- Connection: The default Memcached port is 11211. Connections are represented as opaque handles that should be passed to all other predicates.
- Keys: Keys are atoms up to 250 characters. They must not include control characters or whitespace.
- Flags: Flags are 32-bit unsigned integers stored alongside the data, opaque to the server.
- Expiration: Expiration time in seconds. 0 means never expire. Values over 30 days (2592000) are treated as Unix timestamps.
- Storage commands: Supports set, add, replace, append, prepend, and cas (check-and-set).
- Retrieval commands: Supports get, gets (with CAS token), gat, and gats (get-and-touch).

- Other commands: Supports delete, incr/decr, touch, flush_all, version, stats, and quit.

Inherited public predicates:

Public predicates

connect/3

Connects to a Memcached server at the given host and port. Returns a connection handle for subsequent operations.

Compilation flags:

```
static
```

Template:

```
connect(Host,Port,Connection)
```

Mode and number of proofs:

`connect(+atom,+integer,--compound)` - `one_or_error`

Exceptions:

Connection refused or network error:

`memcached_error(connection_failed)`

---

connect/2

Connects to a Memcached server at the given host on the default port (11211). Returns a connection handle for subsequent operations.

Compilation flags:

`static`

Template:

`connect(Host,Connection)`

Mode and number of proofs:

`connect(+atom,--compound)` - `one_or_error`

Exceptions:

Connection refused or network error:

`memcached_error(connection_failed)`

---

disconnect/1

Disconnects from the Memcached server. Sends a quit command before closing.

Compilation flags:

`static`

Template:

`disconnect(Connection)`

Mode and number of proofs:

`disconnect(+compound)` - `one`

---

set/5

Stores the data unconditionally. Overwrites any existing data for the key.

Compilation flags:

`static`

Template:

```
set(Connection,Key,Value,Flags,ExpTime)
```

Mode and number of proofs:

```
set(+compound,+atom,+atom,+integer,+integer) - one_or_error
```

Exceptions:

Storage failed:

```
memcached_error(not_stored)
```

Network error:

```
memcached_error(Error)
```

---

set/3

Stores the data unconditionally with default flags (0) and no expiration (0).

Compilation flags:

```
static
```

Template:

```
set(Connection,Key,Value)
```

Mode and number of proofs:

```
set(+compound,+atom,+atom) - one_or_error
```

Exceptions:

Storage failed:

```
memcached_error(not_stored)
```

Network error:

```
memcached_error(Error)
```

---

add/5

Stores the data only if the key does not already exist.

Compilation flags:

```
static
```

Template:

```
add(Connection,Key,Value,Flags,ExpTime)
```

Mode and number of proofs:

```
add(+compound,+atom,+atom,+integer,+integer) - one_or_error
```

Exceptions:

Key already exists:

```
memcached_error(not_stored)
```

Network error:

```
memcached_error(Error)
```

---

replace/5

Stores the data only if the key already exists.

Compilation flags:
`static`

Template:
`replace(Connection,Key,Value,Flags,ExpTime)`
Mode and number of proofs:
`replace(+compound,+atom,+atom,+integer,+integer) - one_or_error`

Exceptions:
Key does not exist:
`memcached_error(not_stored)`
Network error:
`memcached_error(Error)`

---

append/3

Appends the data to the end of an existing item's data.

Compilation flags:
`static`

Template:
`append(Connection,Key,Value)`
Mode and number of proofs:
`append(+compound,+atom,+atom) - one_or_error`

Exceptions:
Key does not exist:
`memcached_error(not_stored)`
Network error:
`memcached_error(Error)`

---

prepend/3

Prepends the data to the beginning of an existing item's data.

Compilation flags:
`static`

Template:
`prepend(Connection,Key,Value)`

Mode and number of proofs:

```
prepend(+compound,+atom,+atom) - one_or_error
```

Exceptions:

Key does not exist:

```
memcached_error(not_stored)
```

Network error:

```
memcached_error(Error)
```

---

cas/6

Stores the data only if no one else has updated it since the given CAS unique value was obtained (via gets/3).

Compilation flags:

```
static
```

Template:

```
cas(Connection,Key,Value,Flags,ExpTime,CasUnique)
```

Mode and number of proofs:

```
cas(+compound,+atom,+atom,+integer,+integer,+integer) - one_or_error
```

Exceptions:

CAS value mismatch (item modified by another client):

```
memcached_error(exists)
```

Key does not exist:

```
memcached_error(not_found)
```

Network error:

```
memcached_error(Error)
```

---

get/3

Retrieves the value associated with the key. Fails if the key is not found.

Compilation flags:

```
static
```

Template:

```
get(Connection,Key,Value)
```

Mode and number of proofs:

```
get(+compound,+atom,-atom) - zero_or_one_or_error
```

Exceptions:

Network or stream I/O error while sending or reading the `get` command:

```
memcached_error(Error)
```

---

get/4

Retrieves the value and flags associated with the key. Fails if the key is not found.

Compilation flags:
`static`

Template:
`get(Connection,Key,Value,Flags)`
Mode and number of proofs:
`get(+compound,+atom,-atom,-integer)` - `zero_or_one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the `get` command:
`memcached_error(Error)`

---

gets/4

Retrieves the value and CAS unique token for the key. Fails if the key is not found. The CAS value is used with the cas/6 predicate.

Compilation flags:
`static`

Template:
`gets(Connection,Key,Value,CasUnique)`
Mode and number of proofs:
`gets(+compound,+atom,-atom,-integer)` - `zero_or_one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the `gets` command:
`memcached_error(Error)`

---

gets/5

Retrieves the value, flags, and CAS unique token for the key. Fails if the key is not found.

Compilation flags:
`static`

Template:
`gets(Connection,Key,Value,Flags,CasUnique)`
Mode and number of proofs:
`gets(+compound,+atom,-atom,-integer,-integer)` - `zero_or_one_or_error`

Exceptions:

Network or stream I/O error while sending or reading the `gets` command:
`memcached_error(Error)`

---

mget/3

Retrieves multiple keys at once. Returns a list of `item(Key, Value, Flags)` terms for found keys.

Compilation flags:
`static`

Template:
`mget(Connection,Keys,Items)`
Mode and number of proofs:
`mget(+compound,+list(atom),-list(compound))` - `one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the multi-key retrieval command:
`memcached_error(Error)`

---

delete/2

Deletes the item with the given key. Fails if the key is not found.

Compilation flags:
`static`

Template:
`delete(Connection,Key)`
Mode and number of proofs:
`delete(+compound,+atom)` - `zero_or_one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the `delete` command:
`memcached_error(Error)`

---

incr/4

Increments the numeric value of the given key by the specified amount. Returns the new value. The item must already exist and contain a decimal representation of a 64-bit unsigned integer. Fails if the key is not found.

Compilation flags:
`static`

Template:

```
incr(Connection,Key,Amount,NewValue)
```

Mode and number of proofs:

```
incr(+compound,+atom,+integer,-integer) - zero_or_one_or_error
```

Exceptions:

Network or stream I/O error while sending or reading the `incr` command:

```
memcached_error(Error)
```

---

decr/4

Decrements the numeric value of the given key by the specified amount. Returns the new value. Underflow is caught: decrementing below 0 yields 0. Fails if the key is not found.

Compilation flags:

```
static
```

Template:

```
decr(Connection,Key,Amount,NewValue)
```

Mode and number of proofs:

```
decr(+compound,+atom,+integer,-integer) - zero_or_one_or_error
```

Exceptions:

Network or stream I/O error while sending or reading the `decr` command:

```
memcached_error(Error)
```

---

touch/3

Updates the expiration time of the given key without fetching the data. Fails if the key is not found.

Compilation flags:

```
static
```

Template:

```
touch(Connection,Key,ExpTime)
```

Mode and number of proofs:

```
touch(+compound,+atom,+integer) - zero_or_one_or_error
```

Exceptions:

Network or stream I/O error while sending or reading the `touch` command:

```
memcached_error(Error)
```

---

gat/4

Gets the value of the key and updates its expiration time. Fails if the key is not found.

Compilation flags:
`static`

Template:
`gat(Connection,Key,ExpTime,Value)`
Mode and number of proofs:
`gat(+compound,+atom,+integer,-atom)` - `zero_or_one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the `gat` command:
`memcached_error(Error)`

---

gats/5

Gets the value and CAS unique token of the key and updates its expiration time. Fails if the key is not found.

Compilation flags:
`static`

Template:
`gats(Connection,Key,ExpTime,Value,CasUnique)`
Mode and number of proofs:
`gats(+compound,+atom,+integer,-atom,-integer)` - `zero_or_one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the `gats` command:
`memcached_error(Error)`

---

flush_all/1

Invalidates all existing items immediately.

Compilation flags:
`static`

Template:
`flush_all(Connection)`
Mode and number of proofs:
`flush_all(+compound)` - `one_or_error`

Exceptions:

Network or stream I/O error while sending or reading the `flush_all` command:
`memcached_error(Error)`
The server replies with an error to the `flush_all` command:
`memcached_error(server_error(Message))`

`flush_all/2`

Invalidates all existing items after the specified number of seconds.

Compilation flags:
`static`

Template:
`flush_all(Connection,Delay)`
Mode and number of proofs:
`flush_all(+compound,+integer)` - `one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the delayed `flush_all` command:
`memcached_error(Error)`
The server replies with an error to the delayed `flush_all` command:
`memcached_error(server_error(Message))`

`version/2`

Returns the version string of the Memcached server.

Compilation flags:
`static`

Template:
`version(Connection,Version)`
Mode and number of proofs:
`version(+compound,-atom)` - `one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the `version` command:
`memcached_error(Error)`
The server replies with an unexpected or error response to the `version` command:
`memcached_error(server_error(Message))`

---

stats/2

Returns general-purpose statistics as a list of `stat(Name, Value)` terms.

Compilation flags:
`static`

Template:
`stats(Connection,Stats)`
Mode and number of proofs:
`stats(+compound,-list(compound))` - `one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the `stats` command:
`memcached_error(Error)`

---

stats/3

Returns statistics for the given argument (e.g. `items`, `slabs`, `sizes`) as a list of `stat(Name, Value)` terms.

Compilation flags:
`static`

Template:
`stats(Connection,Argument,Stats)`
Mode and number of proofs:
`stats(+compound,+atom,-list(compound))` - `one_or_error`

Exceptions:
Network or stream I/O error while sending or reading the parameterized `stats` command:
`memcached_error(Error)`

Public predicates

parse/2

Parses a list of bytes in the MessagePack format returning the corresponding term representation. Throws an error when parsing is not possible (usually due to an invalid byte sequence).

Compilation flags:

`static`

Template:

`parse(Bytes,Term)`

Mode and number of proofs:

`parse(@list(byte),-ground)` - `one_or_error`

Exceptions:

`Bytes` is not a ground term:

`instantiation_error`

`Bytes` is ground but not a valid MessagePack byte sequence:

`domain_error(message_pack_byte_sequence,Bytes)`

---

generate/2

Generates a list of bytes in the MessagePack format representing the given term. Throws an error when generating is not possible (usually due to a term with no corresponding MessagePack representation).

Compilation flags:

`static`

Template:

`generate(Term,Bytes)`

Mode and number of proofs:

`generate(@ground,-list(byte))` - `one_or_error`

Exceptions:

`Term` is a variable:

`instantiation_error`

`Term` has no corresponding MessagePack representation:

`domain_error(message_pack_term,Term)`

Protected predicates

Public predicates

include/3

Returns a list of all list elements that satisfy a predicate.

Compilation flags:
`static`

Template:
`include(Closure,List,Included)`

Meta-predicate template:

```
include(1,*,*)
```

Mode and number of proofs:

```
include(+callable,+list,-list) - one
```

---

exclude/3

Returns a list of all list elements that fail to satisfy a predicate.

Compilation flags:

```
static
```

Template:

```
exclude(Closure,List,Excluded)
```

Meta-predicate template:

```
exclude(1,*,*)
```

Mode and number of proofs:

```
exclude(+callable,+list,-list) - one
```

---

findall_member/4

Finds all members of a list that satisfy a given test.

Compilation flags:

```
static
```

Template:

```
findall_member(Member,List,Test,Result)
```

Meta-predicate template:

```
findall_member(*,*,0,*)
```

Mode and number of proofs:

```
findall_member(@term,+list,@callable,-list) - one
```

---

findall_member/5

Finds all members of a list that satisfy a given test appending the given tail to the result.

Compilation flags:

```
static
```

Template:

```
findall_member(Member,List,Test,Result,Tail)
```

Meta-predicate template:

```
findall_member(*,*,0,*,*)
```

Mode and number of proofs:

```
findall_member(@term,+list,@callable,-list,+list) - one
```

---

partition/4

Partition a list of elements in two lists using a predicate.

Compilation flags:

```
static
```

Template:

```
partition(Closure,List,Included,Excluded)
```

Meta-predicate template:

```
partition(1,*,*,*)
```

Mode and number of proofs:

```
partition(+callable,+list,-list,-list) - one
```

---

partition/6

Partitions a list in lists with values less, equal, and greater than a given value using a comparison predicate with the same argument order as `compare/3`.

Compilation flags:

```
static
```

Template:

```
partition(Closure,List,Value,Less,Equal,Greater)
```

Meta-predicate template:

```
partition(3,*,*,*,*,*)
```

Mode and number of proofs:

```
partition(+callable,+list,@term,-list,-list,-list) - one
```

---

fold_left/4

List folding (left associative). Closure is extended with three arguments: accumulator, list element, and updated accumulator.

Compilation flags:

```
static
```

Template:

```
fold_left(Closure,Accumulator,List,Result)
```

Meta-predicate template:

```
fold_left(3,*,*,*)
```

Mode and number of proofs:

```
fold_left(+callable,?term,+list,?term) - zero_or_more
```

---

fold_left_1/3

List folding (left associative). Closure is extended with three arguments: accumulator, list element, and updated accumulator. The initial value of the accumulator is the list first element. Fails for empty lists.

Compilation flags:

```
static
```

Template:

```
fold_left_1(Closure,List,Result)
```

Meta-predicate template:

```
fold_left_1(3,*,*)
```

Mode and number of proofs:

```
fold_left_1(+callable,+list,?term) - zero_or_more
```

---

scan_left/4

List scanning (left associative). Closure is extended with three arguments: accumulator, list element, and updated accumulator.

Compilation flags:

```
static
```

Template:

```
scan_left(Closure,Accumulator,List,Results)
```

Meta-predicate template:

```
scan_left(3,*,*,*)
```

Mode and number of proofs:

```
scan_left(+callable,?term,+list,?list) - zero_or_more
```

---

scan_left_1/3

List scanning (left associative). Closure is extended with three arguments: accumulator, list element, and updated accumulator. The accumulator is initialized with the list first element. Fails for empty lists.

Compilation flags:

```
static
```

Template:

```
scan_left_1(Closure,List,Results)
```

Meta-predicate template:

```
scan_left_1(3,*,*)
```

Mode and number of proofs:

```
scan_left_1(+callable,+list,?list) - zero_or_more
```

---

fold_right/4

List folding (right associative). Closure is extended with three arguments: list element, accumulator, and updated accumulator.

Compilation flags:

```
static
```

Template:

```
fold_right(Closure,Accumulator,List,Result)
```

Meta-predicate template:

```
fold_right(3,*,*,*)
```

Mode and number of proofs:

```
fold_right(+callable,?term,+list,?term) - zero_or_more
```

---

fold_right_1/3

List folding (right associative). Closure is extended with three arguments: list element, accumulator, and updated accumulator. The initial value of the accumulator is the list first element. Fails for empty lists.

Compilation flags:

```
static
```

Template:

```
fold_right_1(Closure,List,Result)
```

Meta-predicate template:

```
fold_right_1(3,*,*)
```

Mode and number of proofs:

```
fold_right_1(+callable,+list,?term) - zero_or_more
```

---

scan_right/4

List scanning (right associative). Closure is extended with three arguments: list element, accumulator, and updated accumulator.

Compilation flags:
`static`

Template:
`scan_right(Closure,Accumulator,List,Results)`
Meta-predicate template:
`scan_right(3,*,*,*)`
Mode and number of proofs:
`scan_right(+callable,?term,+list,?list)` - `zero_or_more`

---

scan_right_1/3

List scanning (right associative). Closure is extended with three arguments: list element, accumulator, and updated accumulator. The accumulator is initialized with the list first element. Fails for empty lists.

Compilation flags:
`static`

Template:
`scan_right_1(Closure,List,Results)`
Meta-predicate template:
`scan_right_1(3,*,*)`
Mode and number of proofs:
`scan_right_1(+callable,+list,?list)` - `zero_or_more`

---

map/2

True if the predicate succeeds for each list element.

Compilation flags:
`static`

Template:
`map(Closure,List)`
Meta-predicate template:
`map(1,*)`
Mode and number of proofs:
`map(+callable,?list)` - `zero_or_more`

---

map/3

List mapping predicate taken arguments from two lists of elements.

Compilation flags:
`static`

Template:
`map(Closure,List1,List2)`
Meta-predicate template:
`map(2,*,*)`
Mode and number of proofs:
`map(+callable,?list,?list)` - `zero_or_more`

---

map/4

List mapping predicate taken arguments from three lists of elements.

Compilation flags:
`static`

Template:
`map(Closure,List1,List2,List3)`
Meta-predicate template:
`map(3,*,*,*)`
Mode and number of proofs:
`map(+callable,?list,?list,?list)` - `zero_or_more`

---

map/5

List mapping predicate taken arguments from four lists of elements.

Compilation flags:
`static`

Template:
`map(Closure,List1,List2,List3,List4)`
Meta-predicate template:
`map(4,*,*,*,*)`
Mode and number of proofs:
`map(+callable,?list,?list,?list,?list)` - `zero_or_more`

---

map/6

List mapping predicate taken arguments from five lists of elements.

Compilation flags:
`static`

Template:
`map(Closure,List1,List2,List3,List4,List5)`
Meta-predicate template:
`map(5,*,*,*,*,*)`
Mode and number of proofs:
`map(+callable,?list,?list,?list,?list,?list)` - `zero_or_more`

---

map/7

List mapping predicate taken arguments from six lists of elements.

Compilation flags:
`static`

Template:
`map(Closure,List1,List2,List3,List4,List5,List6)`
Meta-predicate template:
`map(6,*,*,*,*,*,*)`
Mode and number of proofs:
`map(+callable,?list,?list,?list,?list,?list,?list)` - `zero_or_more`

---

map/8

List mapping predicate taken arguments from seven lists of elements.

Compilation flags:
`static`

Template:
`map(Closure,List1,List2,List3,List4,List5,List6,List7)`
Meta-predicate template:
`map(7,*,*,*,*,*,*,*)`
Mode and number of proofs:
`map(+callable,?list,?list,?list,?list,?list,?list,?list)` - `zero_or_more`

---

map_reduce/5

Map a list and apply a fold left (reduce) to the resulting list.

Compilation flags:
`static`

Template:
`map_reduce(Map,Reduce,Accumulator,List,Result)`
Meta-predicate template:
`map_reduce(2,3,*,*,*)`
Mode and number of proofs:
`map_reduce(+callable,+callable,+term,?list,?term) - zero_or_more`

meta

1.218 meta_compiler

object

1.218.1 meta_compiler

Compiler for the `meta` object meta-predicates. Generates auxiliary predicates in order to avoid meta-call overheads.

Availability:
`logtalk_load(meta_compiler(loader))`

Author: Paulo Moura
Version: 0:16:1
Date: 2026-04-22

Compilation flags:
`static, context_switching_calls`

Implements:

`public` *expanding*

Uses:

gensym
list
logtalk
user

Remarks:

- Usage: Compile source files with calls to the `meta` object meta-predicates using the compiler option `hook(meta_compiler)`.

Inherited public predicates:

goal_expansion/2 *term_expansion/2*

- *Public predicates*
- *Protected predicates*
- *Private predicates*
  - *generated_predicate_/1*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

generated_predicate_/1

Table of generated auxiliary predicates.

Compilation flags:

`dynamic`

Template:

`generated_predicate_(Predicate)`

Mode and number of proofs:

`generated_predicate_(?predicate_indicator)` - `zero_or_more`

Operators

(none)

See also

meta

1.219 metagol

object

1.219.1 `metagol`

Inductive logic programming (ILP) system based on meta-interpretive learning.

Availability:
`logtalk_load(metagol(loader))`

Author: Metagol authors; adapted to Logtalk by Paulo Moura.
Version: 0:25:0
Date: 2026-08-10

Copyright: Copyright 2016 Metagol authors; Copyright 2018-2024 Paulo Moura
License: BSD-3-Clause

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *expanding*
Provides:
logtalk::message_tokens//2
logtalk::message_prefix_stream/4
Uses:
coroutining
integer
list
logtalk
meta
timeout

Remarks:
(none)

Inherited public predicates:

Public predicates

learn/3

Learns from a set of positive examples and a set of negative examples and returns the learned program.

Compilation flags:

```
static
```

Template:

```
learn(PositiveExamples,NegativeExamples,Program)
```

Mode and number of proofs:

```
learn(@list(example),@list(example),-list(term)) - zero_or_more
```

learn/2

Learns from a set of positive examples and a set of negative examples and pretty prints the learned program.

Compilation flags:
`static`

Template:
`learn(PositiveExamples,NegativeExamples)`
Mode and number of proofs:
`learn(@list(example),@list(example))` - `zero_or_more`

---

learn_seq/2

Learns from a sequence of examples represented as a list of PositiveExamples/NegativeExamples elements and returns the learned program.

Compilation flags:
`static`

Template:
`learn_seq(Examples,Program)`
Mode and number of proofs:
`learn_seq(@list(example),-list(clause))` - `zero_or_one`

---

learn_with_timeout/4

Learns from a set of positive examples and a set of negative examples and returns the learned program constrained by the given timeout or its default value.

Compilation flags:
`static`

Template:
`learn_with_timeout(PositiveExamples,NegativeExamples,Program,Timeout)`
Mode and number of proofs:
`learn_with_timeout(@list(example),@list(example),-list(term),+number)` - `zero_or_one_or_error`
`learn_with_timeout(@list(example),@list(example),-list(term),-number)` - `zero_or_one_or_error`

Exceptions:
Learning does not complete in the allowed time:
`timeout(learn(PositiveExamples,NegativeExamples,Program))`

---

program_to_clauses/2

Converts a learned program into a list of clauses.

Compilation flags:
```
static
```

Template:
```
program_to_clauses(Program,Clauses)
```
Mode and number of proofs:
```
program_to_clauses(@list(term),-list(clause)) - one
```

---

pprint/1

Pretty prints a learned program.

Compilation flags:
```
static
```

Template:
```
pprint(Program)
```
Mode and number of proofs:
```
pprint(@list(term)) - one
```

---

metarule/6

Compiled metarule, generated from a user-defined metarule/3 or metarule/4 clause, relating a name, its substitutions, a head atom, a body, a recursion flag, and the current call path.

Compilation flags:
```
static
```

Template:
```
metarule(Name,Subs,Head,Body,Recursive,Path)
```
Mode and number of proofs:
```
metarule(?atom,?list,?callable,?list,?atom,?list) - zero_or_more
```

---

head_pred/1

Declares a predicate indicator that can be used in the head of a learned clause.

Compilation flags:
`static`

Template:
`head_pred(PredicateIndicator)`
Mode and number of proofs:
`head_pred(?predicate_indicator)` - `zero_or_more`

---

ibk/3

Interpreted background knowledge clause, generated from a user-defined ibk/2 fact or rule, relating a head atom (as a list) to a body (as a list of atoms) and the current call path.

Compilation flags:
`static`

Template:
`ibk(Head,Body,Path)`
Mode and number of proofs:
`ibk(?list,?list,?list)` - `zero_or_more`

---

func_test/3

Relates an atom to a test atom and a condition used to check that the learned program is functional.

Compilation flags:
`static`

Template:
`func_test(Atom,TestAtom,Condition)`
Mode and number of proofs:
`func_test(@callable,-callable,-callable)` - `zero_or_more`

---

body_pred/1

Declares a predicate indicator that can be used in the body of a learned clause.

Compilation flags:
`dynamic`

Template:
`body_pred(PredicateIndicator)`
Mode and number of proofs:
`body_pred(?predicate_indicator)` - `zero_or_more`

---

functional/0

True when the learned program is required to be functional (deterministic).

Compilation flags:
`dynamic`

Mode and number of proofs:
`functional` - `zero_or_one`

---

min_clauses/1

Minimum number of clauses to try when searching for a learned program.

Compilation flags:
`dynamic`

Template:
`min_clauses(MinClauses)`
Mode and number of proofs:
`min_clauses(?integer)` - `zero_or_one`

---

max_clauses/1

Maximum number of clauses to try when searching for a learned program.

Compilation flags:
`dynamic`

Template:

```
max_clauses(MaxClauses)
```
Mode and number of proofs:
```
max_clauses(?integer) - zero_or_one
```

---

max_inv_preds/1

Maximum number of invented predicate symbols allowed per learning task.

Compilation flags:
```
dynamic
```

Template:
```
max_inv_preds(MaxInventedPredicates)
```
Mode and number of proofs:
```
max_inv_preds(?integer) - zero_or_one
```

---

metarule_next_id/1

Next identifier to use when generating a name for an anonymous metarule.

Compilation flags:
```
dynamic
```

Template:
```
metarule_next_id(Id)
```
Mode and number of proofs:
```
metarule_next_id(?integer) - zero_or_one
```

---

timeout/1

Default timeout, in seconds, used when learning a program.

Compilation flags:
```
dynamic
```

Template:
```
timeout(Timeout)
```
Mode and number of proofs:
```
timeout(?number) - zero_or_one
```

Protected predicates

pprint_clause/1

Pretty prints a single learned clause. Can be redefined to customize the printing of learned clauses.

Compilation flags:
```
static
```

Template:
```
pprint_clause(Clause)
```
Mode and number of proofs:
```
pprint_clause(@clause) - one
```

---

compiled_pred_call/2

Asserted clause used to call a compiled (pre-existing) predicate given its name and list of arguments.

Compilation flags:
```
dynamic
```

Template:
```
compiled_pred_call(Predicate,Arguments)
```
Mode and number of proofs:
```
compiled_pred_call(?atom,?list) - zero_or_more
```

---

body_pred_call/2

Asserted clause used to call a background knowledge predicate given its name and list of arguments.

Compilation flags:
```
dynamic
```

Template:
```
body_pred_call(Predicate,Arguments)
```
Mode and number of proofs:
```
body_pred_call(?atom,?list) - zero_or_more
```

---

type/3

Asserted fact classifying a predicate, given by its name and arity, by its role (head_pred, body_pred, ibk_head_pred, or compiled_pred).

Compilation flags:
`dynamic`

Template:
`type(Name,Arity,Type)`
Mode and number of proofs:
`type(?atom,?integer,?atom)` - `zero_or_more`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.219.2 metagol_example_protocol

Convenient learning predicates for use in examples and unit tests.

Availability:
`logtalk_load(metagol(loader))`

Author: Paulo Moura.
Version: 0:1:1
Date: 2024-03-15

License: BSD-3-Clause

Compilation flags:

(none)

1.220 mime_types

object

1.220.1 `mime_types`

MIME type registry and convenience predicates for mapping file names and URLs to media types.

Availability:
`logtalk_load(mime_types(loader))`

Author: Paulo Moura
Version: 1:1:1
Date: 2026-06-01

Compilation flags:
`static, context_switching_calls`

Uses:
list
os
reader
string(Representation)

Remarks:

- Default behavior: Convenience predicates default to lenient lookup by consulting both built-in standard mappings and built-in common mappings.
- Path decomposition: File path decomposition uses the `os` library `decompose_file_name/4` predicate.
- External overlays: Additional `mime.types`-style files can be loaded into the in-memory registry using the `load/1-2` predicates.

Inherited public predicates:
(none)

- *Public predicates*
  - *guess_type/3*
  - *guess_type/4*
  - *guess_file_type/3*
  - *guess_file_type/4*
  - *extension_type/2*

  - *guess_extension/2*
  - *guess_extension/3*

      - *guess_all_extensions/2*
      - *guess_all_extensions/3*
      - *add_type/2*
      - *add_type/3*
      - *read_mime_types/2*
      - *load/1*
      - *load/2*
      - *reset/0*
      - *suffix_alias/2*
      - *encoding_suffix/2*
  - *Protected predicates*
  - *Private predicates*
      - *runtime_type_/3*
  - *Operators*

Public predicates

guess_type/3

Guesses the MIME type and content encoding for a URL or file name using lenient lookup. Unknown values are returned as the empty atom.

Compilation flags:

```
static
```

Template:

```
guess_type(Resource,Type,Encoding)
```

Mode and number of proofs:

```
guess_type(+atom,-atom,-atom) - one
```

---

guess_type/4

Guesses the MIME type and content encoding for a URL or file name. When `Strict` is `true`, only built-in standard mappings and strict runtime overlays are consulted.

Compilation flags:

```
static
```

Template:

```
guess_type(Resource,Type,Encoding,Strict)
```

Mode and number of proofs:

```
guess_type(+atom,-atom,-atom,+boolean) - one
```

---

guess_file_type/3

Guesses the MIME type and content encoding for a file path using lenient lookup. Unknown values are returned as the empty atom.

Compilation flags:
```
static
```

Template:
```
guess_file_type(Path,Type,Encoding)
```
Mode and number of proofs:
```
guess_file_type(+atom,-atom,-atom) - one
```

---

guess_file_type/4

Guesses the MIME type and content encoding for a file path.

Compilation flags:
```
static
```

Template:
```
guess_file_type(Path,Type,Encoding,Strict)
```
Mode and number of proofs:
```
guess_file_type(+atom,-atom,-atom,+boolean) - one
```

---

extension_type/2

Returns the MIME type associated with a file extension using lenient lookup.

Compilation flags:
```
static
```

Template:
```
extension_type(Extension,Type)
```
Mode and number of proofs:
```
extension_type(+atom,-atom) - zero_or_one
```

---

extension_type/3

Returns the MIME type associated with a file extension.

Compilation flags:
```
static
```

Template:
```
extension_type(Extension,Type,Strict)
```
Mode and number of proofs:
```
extension_type(+atom,-atom,+boolean) - zero_or_one
```

---

guess_extension/2

Returns the preferred file extension associated with a MIME type using lenient lookup.

Compilation flags:
```
static
```

Template:
```
guess_extension(Type,Extension)
```
Mode and number of proofs:
```
guess_extension(+atom,-atom) - zero_or_one
```

---

guess_extension/3

Returns the preferred file extension associated with a MIME type.

Compilation flags:
```
static
```

Template:
```
guess_extension(Type,Extension,Strict)
```
Mode and number of proofs:
```
guess_extension(+atom,-atom,+boolean) - zero_or_one
```

---

guess_all_extensions/2

Returns all known file extensions associated with a MIME type using lenient lookup.

Compilation flags:

```
static
```

Template:

```
guess_all_extensions(Type,Extensions)
```

Mode and number of proofs:

```
guess_all_extensions(+atom,-list(atom)) - one
```

---

guess_all_extensions/3

Returns all known file extensions associated with a MIME type.

Compilation flags:

```
static
```

Template:

```
guess_all_extensions(Type,Extensions,Strict)
```

Mode and number of proofs:

```
guess_all_extensions(+atom,-list(atom),+boolean) - one
```

---

add_type/2

Adds a lenient runtime mapping from a MIME type to a file extension.

Compilation flags:

```
static
```

Template:

```
add_type(Type,Extension)
```

Mode and number of proofs:

```
add_type(+atom,+atom) - one
```

---

add_type/3

Adds a runtime mapping from a MIME type to a file extension.

Compilation flags:
`static`

Template:
`add_type(Type,Extension,Strict)`
Mode and number of proofs:
`add_type(+atom,+atom,+boolean) - one`

---

read_mime_types/2

Reads a `mime.types`-style file returning a list of `Extension-Type` pairs.

Compilation flags:
`static`

Template:
`read_mime_types(File,Pairs)`
Mode and number of proofs:
`read_mime_types(+atom,-list(pair(atom,atom))) - one`

---

load/1

Loads a `mime.types`-style file as a lenient runtime overlay.

Compilation flags:
`static`

Template:
`load(File)`
Mode and number of proofs:
`load(+atom) - one`

---

load/2

Loads a `mime.types`-style file as a strict or lenient runtime overlay.

Compilation flags:
`static`

Template:
`load(File,Strict)`
Mode and number of proofs:
`load(+atom,+boolean)` - `one`

---

reset/0

Clears all runtime MIME type overlays.

Compilation flags:
`static`

Mode and number of proofs:
`reset` - `one`

---

suffix_alias/2

Returns suffix aliases used before splitting encoding and type suffixes.

Compilation flags:
`static`

Template:
`suffix_alias(Alias,Expanded)`
Mode and number of proofs:
`suffix_alias(?atom,?atom)` - `zero_or_more`

---

encoding_suffix/2

Returns content-encoding suffix mappings.

Compilation flags:
`static`

Template:
`encoding_suffix(Extension,Encoding)`

Mode and number of proofs:
`encoding_suffix(?atom,?atom)` - `zero_or_more`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

`runtime_type_/3`

Table of runtime MIME type overlays.

Compilation flags:
`dynamic`

Template:
`runtime_type_(Strict,Extension,Type)`
Mode and number of proofs:
`runtime_type_(?boolean,?atom,?atom)` - `zero_or_more`

Operators

(none)

1.221 minizinc

object

1.221.1 `minizinc`

Process-backed MiniZinc CLI solving, source generation, and collected result inspection.

Availability:
`logtalk_load(minizinc(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-09

Compilation flags:
`static, context_switching_calls`

Implements:

- *Operators*

Public predicates

`decode/5`

Decodes CLI JSON-stream output and process metadata into a collected `minizinc_result(Status, Solutions, Properties)` term.

Compilation flags:
`static`

Template:
`decode(Codes,RawStatus,NormalizedStatus,Diagnostics,Result)`

Mode and number of proofs:
`decode(+list(code),+term,+compound,+list(code),-compound)` - `one_or_error`

Exceptions:
`Codes` is a partial list or a list with an element `Element` which is a variable:
`instantiation_error`
`Codes` is neither a partial list nor a list of character codes:
`type_error(codes,Codes)`
A `--json-stream` line is not valid JSON:
`domain_error(minizinc_output,json-Line)`
A JSON message field has an invalid type or value:
`domain_error(minizinc_output,Field-Value)`
A JSON message is missing a required field:
`domain_error(minizinc_output,Field-missing)`
`RawStatus` is not a ground term:
`instantiation_error`

`NormalizedStatus` is not a ground term:
`instantiation_error`
`NormalizedStatus` is not `exit(0)` and no JSON-stream message was produced:
`domain_error(minizinc_process_status,NormalizedStatus)`
`Diagnostics` is a partial list or a list with an element `Element` which is a variable:
`instantiation_error`
`Diagnostics` is neither a partial list nor a list of character codes:
`type_error(codes,Diagnostics)`

- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

minizinc_statement/2

Enumerates, by backtracking, canonical MiniZinc statements in source order and their origins.

Compilation flags:
`static`

Template:
`minizinc_statement(Statement,Origin)`
Mode and number of proofs:
`minizinc_statement(-compound,-term)` - `zero_or_more`

Remarks:

- Origin: Either `source(File, Start, End)` or `unknown`.

Protected predicates

(none)

Private predicates

- *Private predicates*
- *Operators*

Public predicates

quote/3

Quotes an atom as one POSIX shell or Windows PowerShell literal, without interpolation.

Compilation flags:

`static`

Template:

`quote(Platform,Argument,Quoted)`

Mode and number of proofs:

`quote(+atom,+atom,-atom)` - `one_or_error`

Exceptions:

`Platform` is a variable:

`instantiation_error`

`Argument` is a variable:

`instantiation_error`

`Platform` is neither a variable nor an atom:

`type_error(atom,Platform)`

`Argument` is neither a variable nor an atom:

`type_error(atom,Argument)`

`Platform` is an atom but neither `posix` nor `windows`:

`domain_error(minizinc_shell_platform,Platform)`

`Argument` is an atom but contains a null character:

`domain_error(minizinc_shell_argument,Argument)`

`run/8`

Runs the CLI using an owned directory and separate UTF-8 output files, returning only after cleanup.

Compilation flags:

`static`

Template:

`run(Executable,Arguments,Source,DataPath,Codes,Diagnostics,RawStatus,NormalizedStatus)`

Mode and number of proofs:

`run(+atom,+list(atom),+compound,+atom,-list(integer),-list(integer),-term,-compound)` - `one_or_error`

Exceptions:

`Executable`, `Arguments`, `Source`, or `DataPath` is a variable:

`instantiation_error`

An element of the list `Arguments` is a variable:

`instantiation_error`

`Executable` is neither a variable nor an atom:

`type_error(atom,Executable)`

`Arguments` is neither a variable nor a list:

`type_error(list,Arguments)`

An element of the list `Arguments` is neither a variable nor an atom:

`type_error(atom,Argument)`

`DataPath` is neither `none` nor an atom:

`type_error(atom,DataPath)`

`Source` is neither `file(Path)` nor `codes(Codes)`:

`domain_error(minizinc_process_source,Source)`

An argument contains a null character:

`domain_error(minizinc_shell_argument,Argument)`

A launcher dependency does not exist:

`existence_error(command,Command)`

A source or capture file does not exist:

`existence_error(source_sink,Path)`

A source or capture file cannot be opened:

`permission_error(open,source_sink,Path)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

```
minizinc_transport(Stage,Status,Details)
```

Protected predicates

(no local declarations; see entity ancestors if any)

  - *serialize/2*
  - *serialize/4*
  - *valid_identifier/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

serialize/2

Serializes ground canonical MiniZinc statements to character codes.

Compilation flags:
`static`

Template:
`serialize(Statements,Codes)`
Mode and number of proofs:
`serialize(+list(compound),-list(integer))` - `one_or_error`

Exceptions:
`Statements` is a variable:
`instantiation_error`
An element `Statement` of the list `Statements` is a variable:
`instantiation_error`
`Statements` is neither a variable nor a list:
`type_error(list,Statements)`
An element `Statement` of the list `Statements` is not a valid statement:
`domain_error(minizinc_statement,Statement)`

---

serialize/4

Serializes statements with origins and returns `line(Start, End, Origin)` source-map entries.

Compilation flags:
`static`

Template:
`serialize(Statements,Origins,Codes,SourceMap)`
Mode and number of proofs:
`serialize(+list(compound),+list,-list(integer),-list(compound))` - `one_or_error`

Exceptions:
`Statements` or `Origins` is a variable:
`instantiation_error`
An element `Statement` of the list `Statements` is a variable:
`instantiation_error`
An element `Origin` of the list `Origins` is a variable:
`instantiation_error`
`Statements` is neither a variable nor a list:
`type_error(list,Statements)`
`Origins` is neither a variable nor a list:
`type_error(list,Origins)`
An element `Statement` of the list `Statements` is not a valid statement:

`domain_error(minizinc_statement,Statement)`
`Origins` has an element that is neither `unknown` nor a valid `source(File, Start, End)` term, or its length differs from `Statements`:
`domain_error(minizinc_origins,Origins)`

`valid_identifier/1`

True if the argument is a supported, non-reserved MiniZinc identifier atom.

Compilation flags:
`static`

Template:
`valid_identifier(Name)`
Mode and number of proofs:
`valid_identifier(@term)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.221.7 `minizinc_protocol`

Protocol for process-backed MiniZinc solving, source generation, and result inspection.

Availability:
`logtalk_load(minizinc(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-11

Compilation flags:
`static`

Dependencies:

Public predicates

solve/2

Solves a source with default options using the external MiniZinc CLI and returns a collected result after cleanup. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`.

Compilation flags:
`static`

Template:
`solve(Source,Result)`

Mode and number of proofs:
`solve(+compound,-compound)` - `one_or_error`

Exceptions:
`Source` is not a ground term:
`instantiation_error`
`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `minizinc_problem_protocol`:
`domain_error(minizinc_source,Source)`
`Statements` is ground but not a list:
`type_error(list,Statements)`
A statement enumerated by the provider object is not a valid statement:
`domain_error(minizinc_statement,Statement)`
An origin enumerated by the provider object is invalid, or its origins and statements differ in length:
`domain_error(minizinc_origins,Origins)`
`Codes` is ground but not a list of character codes:
`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:
`type_error(integer,Code)`
An element `Code` of the list `Codes` is an integer but not a valid character code:
`domain_error(character_code,Code)`
`Path` is ground but not an atom:
`type_error(atom,Path)`
A launcher argument contains a null character:
`domain_error(minizinc_shell_argument,Argument)`
The `minizinc` executable or a shell dependency does not exist:
`existence_error(command,Command)`
An owned directory cannot be found during cleanup:
`existence_error(directory,Directory)`
An owned file or directory cannot be removed:
`permission_error(delete,source_sink,Path)`
A character sequence is not valid UTF-8:
`representation_error(utf_8)`
A launcher operation fails:
`minizinc_transport(Stage,Status,Details)`
Solver output is invalid or inconsistent with its exit status:
`minizinc_solver_error(Formal,Status,Diagnostics,SourceMap)`

`solve/3`

Solves a source using solver selection, executable, enumeration, data, and resource options. Repeated options use the first occurrence. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`.

Compilation flags:
`static`

Template:
`solve(Source,Result,Options)`
Mode and number of proofs:
`solve(+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Source` is not a ground term:
`instantiation_error`
`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `minizinc_problem_protocol`:
`domain_error(minizinc_source,Source)`
`Statements` is ground but not a list:
`type_error(list,Statements)`
A statement enumerated by the provider object is not a valid statement:
`domain_error(minizinc_statement,Statement)`
`Codes` is ground but not a list of character codes:
`type_error(codes,Codes)`
An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(minizinc_origins,Origins)`

A launcher argument contains a null character:

`domain_error(minizinc_shell_argument,Argument)`

The `minizinc` executable or a shell dependency does not exist:

`existence_error(command,Command)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

`minizinc_transport(Stage,Status,Details)`

Solver output is invalid or inconsistent with its exit status:

`minizinc_solver_error(Formal,Status,Diagnostics,SourceMap)`

`program/1`

Generates and prints MiniZinc source to the current output, equivalent to `program/2` followed by `print_program/1`, without invoking MiniZinc.

Compilation flags:

`static`

Template:

`program(Source)`

Mode and number of proofs:

`program(+compound)` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `minizinc_problem_protocol`:

`domain_error(minizinc_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(minizinc_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(minizinc_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

---

program/2

Returns MiniZinc source codes from `object(Object)`, `terms(Statements)`, `codes(Codes)`, or `file(Path)` without invoking MiniZinc.

Compilation flags:

`static`

Template:

`program(Source,Codes)`

Mode and number of proofs:

`program(+compound,-list(integer))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `minizinc_problem_protocol`:

`domain_error(minizinc_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(minizinc_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(minizinc_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

`print_program/1`

Prints MiniZinc character codes to the current output without adding a newline or invoking MiniZinc.

Compilation flags:

`static`

Template:

`print_program(Codes)`

Mode and number of proofs:

`print_program(+list(integer))` - `one_or_error`

Exceptions:

`Codes` is not a ground term:

`instantiation_error`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

---

model/2

Enumerates, by backtracking, collected `solution(Values, Objective, Time)` records without starting a process.

Compilation flags:
`static`

Template:
`model(Result,Solution)`
Mode and number of proofs:
`model(+compound,-compound)` - `zero_or_more`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected MiniZinc result:
`domain_error(minizinc_result,Result)`

---

result_property/2

Enumerates, by backtracking, `status(Status)` and the stored result properties.

Compilation flags:
`static`

Template:
`result_property(Result,Property)`
Mode and number of proofs:
`result_property(+compound,?compound)` - `zero_or_more`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected MiniZinc result:
`domain_error(minizinc_result,Result)`

---

print_result/1

Prints collected solutions, objective values, and solver status to the current output using MiniZinc-style markers, without invoking the solver.

Compilation flags:
`static`

Template:

```
print_result(Result)
```

Mode and number of proofs:

```
print_result(+compound) - one_or_error
```

Exceptions:

`Result` is not a ground term:

```
instantiation_error
```

`Result` is not a valid collected MiniZinc result:

```
domain_error(minizinc_result,Result)
```

The current output stream does not allow writing:

```
permission_error(output,stream,Stream)
```

Public predicates

connect/3

Opens a transport connection for an MQTT or MQTT-over-TLS address and completes the MQTT CONNECT/CONNACK exchange.

Compilation flags:

`static`

Template:

`connect(Address,Connection,Options)`

Mode and number of proofs:

`connect(+atom,--compound,+list)` - `one_or_error`

Exceptions:

`Address` is a variable:

`instantiation_error`

`Address` is neither a variable nor an atom:

`type_error(atom,Address)`

`Address` is an atom but not a valid MQTT address:

`domain_error(mqtt_address,Address)`

The server rejects the MQTT connection:

`domain_error(mqtt_connack_reason_code,ReasonCode)`

The server response is not a CONNACK packet:

`domain_error(mqtt_packet,expected(connack,Packet))`

---

connect/4

Opens a transport connection to the given host and port and completes the MQTT CONNECT/CONNACK exchange. The `scheme/1` option selects MQTT over TCP or TLS.

Compilation flags:

`static`

Template:

`connect(Host,Port,Connection,Options)`

Mode and number of proofs:

`connect(+atom,+integer,--compound,+list)` - `one_or_error`

Exceptions:

`Host` or `Port` is a variable:

`instantiation_error`

`Host` is neither a variable nor an atom:

`type_error(atom,Host)`

`Port` is neither a variable nor an integer:

`type_error(integer,Port)`

`Port` is a negative integer:

`domain_error(non_negative_integer,Port)`

The server rejects the MQTT connection:

`domain_error(mqtt_connack_reason_code,ReasonCode)`

The server response is not a CONNACK packet:

`domain_error(mqtt_packet,expected(connack,Packet))`

---

disconnect/2

Closes an MQTT transport connection. MQTT DISCONNECT packet exchange will be layered on this transport operation.

Compilation flags:

`static`

Template:

`disconnect(Connection,Options)`

Mode and number of proofs:

`disconnect(+compound,+list)` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is not a valid option:

`domain_error(option,Option)`

---

connection_alive/1

True if the term is an MQTT connection handle created by this object.

Compilation flags:

`static`

Template:

`connection_alive(Connection)`

Mode and number of proofs:

`connection_alive(+compound)` - `zero_or_one`

---

packet_type/2

Table of MQTT control packet type names and numeric codes.

Compilation flags:
`static`

Template:
`packet_type(Type,Code)`
Mode and number of proofs:
`packet_type(?atom,?integer)` - `zero_or_more`

---

reason_code/3

Table of MQTT reason code names and numeric codes by packet type.

Compilation flags:
`static`

Template:
`reason_code(PacketType,Name,Code)`
Mode and number of proofs:
`reason_code(?atom,?atom,?integer)` - `zero_or_more`

---

publish/4

Publishes a message and waits synchronously for the required MQTT acknowledgement.

Compilation flags:
`static`

Template:
`publish(Connection,Topic,Payload,Options)`
Mode and number of proofs:
`publish(+compound,+atom,+term,+list)` - `one_or_error`

Exceptions:
`Topic` is not a valid MQTT topic name:
`domain_error(mqtt_topic_name,Topic)`
`Options` contains an invalid packet identifier:
`domain_error(mqtt_packet_identifier,PacketIdentifier)`
`Options` contains an invalid QoS value:
`domain_error(mqtt_qos,QoS)`
The server response is not the expected acknowledgement packet:
`domain_error(mqtt_packet,expected(Type-PacketIdentifier,Packet))`

---

subscribe/4

Subscribes to topic filters and waits synchronously for the matching SUBACK.

Compilation flags:
`static`

Template:
`subscribe(Connection,TopicFilters,Result,Options)`
Mode and number of proofs:
`subscribe(+compound,+list,--list,+list)` - `one_or_error`

Exceptions:
`TopicFilters` is empty:
`domain_error(mqtt_subscriptions,[])`
An element `TopicFilter` is not a valid MQTT topic filter:
`domain_error(mqtt_topic_filter,TopicFilter)`
`Options` contains invalid subscription options:
`domain_error(mqtt_subscription_options,Byte)`
The server response is not the expected SUBACK packet:
`domain_error(mqtt_packet,expected(suback-PacketIdentifier,Packet))`

---

unsubscribe/4

Unsubscribes from topic filters and waits synchronously for the matching UNSUBACK.

Compilation flags:
`static`

Template:
`unsubscribe(Connection,TopicFilters,Result,Options)`
Mode and number of proofs:
`unsubscribe(+compound,+list,--list,+list)` - `one_or_error`

Exceptions:
`TopicFilters` is empty:
`domain_error(mqtt_topic_filters,[])`
An element `TopicFilter` is not a valid MQTT topic filter:
`domain_error(mqtt_topic_filter,TopicFilter)`
The server response is not the expected UNSUBACK packet:
`domain_error(mqtt_packet,expected(unsuback-PacketIdentifier,Packet))`

---

receive/3

Receives the next MQTT packet.

Compilation flags:
`static`

Template:
`receive(Connection,Message,Options)`
Mode and number of proofs:
`receive(+compound,--compound,+list)` - `one_or_error`

Exceptions:
The connection input ends before a complete packet is read:
`domain_error(mqtt_packet_stream,unexpected_end_of_file)`
The received bytes do not encode a valid MQTT packet:
`domain_error(mqtt_packet,Packet)`

---

send_pingreq/1

Sends a PINGREQ packet.

Compilation flags:
`static`

Template:
`send_pingreq(Connection)`
Mode and number of proofs:
`send_pingreq(+compound)` - `one_or_error`

Exceptions:
The PINGREQ packet cannot be written to the connection output stream:
`resource_error(mqtt_packet_stream)`

---

ping/2

Sends PINGREQ and waits synchronously for PINGRESP.

Compilation flags:
`static`

Template:
`ping(Connection,Options)`
Mode and number of proofs:
`ping(+compound,+list)` - `one_or_error`

Exceptions:

The connection input ends before a complete packet is read:

```
domain_error(mqtt_packet_stream,unexpected_end_of_file)
```

The server response is not a PINGRESP packet:

```
domain_error(mqtt_packet,expected(pingresp,Packet))
```

---

encode_packet/2

Encodes a normalized MQTT packet term.

Compilation flags:

```
static
```

Template:

```
encode_packet(Packet,Bytes)
```

Mode and number of proofs:

```
encode_packet(+compound,--list(integer)) - one_or_error
```

Exceptions:

`Packet` contains an invalid MQTT field value:

```
domain_error(mqtt_packet,Packet)
```

`Packet` has a packet type that is not yet supported:

```
resource_error(mqtt_packet_support)
```

---

decode_packet/2

Decodes bytes into a normalized MQTT packet term.

Compilation flags:

```
static
```

Template:

```
decode_packet(Bytes,Packet)
```

Mode and number of proofs:

```
decode_packet(+list(integer),--compound) - one_or_error
```

Exceptions:

`Bytes` contains an invalid MQTT packet encoding:

```
domain_error(mqtt_packet,Bytes)
```

`Bytes` contains bytes after the encoded packet:

```
domain_error(mqtt_packet_trailing_bytes,Rest)
```

`Bytes` encodes a packet type that is not yet supported:

```
resource_error(mqtt_packet_support)
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

resolve_address/4

Resolves an MQTT address into scheme, host, and port.

Compilation flags:
`static`

Template:
`resolve_address(Address,Scheme,Host,Port)`
Mode and number of proofs:
`resolve_address(+atom,-atom,-atom,-integer)` - `one_or_error`

Exceptions:
`Address` is a variable:
`instantiation_error`
`Address` is neither a variable nor an atom:
`type_error(atom,Address)`
`Address` is an atom but not a valid MQTT address:
`domain_error(mqtt_address,Address)`
`Address` contains an invalid authority:
`domain_error(mqtt_address_authority,Authority)`

---

resolve_transport/3

Resolves an explicit or default transport object for the given MQTT scheme.

Compilation flags:
`static`

Template:
`resolve_transport(Scheme,Transport0,Transport)`
Mode and number of proofs:
`resolve_transport(+atom,+object_identifier,-object_identifier)` - `one_or_error`

Exceptions:
`Transport0` is a variable:
`instantiation_error`
`Transport0` is neither a variable nor an existing object:
`existence_error(object,Transport0)`
`Transport0` does not implement `http_transport_protocol`:
`domain_error(http_transport_protocol_object,Transport0)`
`Transport0` does not support `Scheme`:

```
consistency_error(mqtt_options,scheme(Scheme),transport(Transport0))
```

---

append_tls_transport/3

Adds `connection_transport(tls)` to connection options for MQTT-over-TLS unless already specified.

Compilation flags:
`static`

Template:
`append_tls_transport(Scheme,Options,OptionsWithTransport)`
Mode and number of proofs:
`append_tls_transport(+atom,+list,-list)` - `one`

---

write_packet/2

Encodes and writes an MQTT packet to a binary output stream.

Compilation flags:
`static`

Template:
`write_packet(Output,Packet)`
Mode and number of proofs:
`write_packet(+stream,+compound)` - `one_or_error`

Exceptions:
`Packet` is not a supported normalized MQTT packet:
`resource_error(mqtt_packet_support)`
`Output` cannot be written or flushed:
`resource_error(mqtt_packet_stream)`

---

read_packet/2

Reads and decodes one MQTT packet from a binary input stream.

Compilation flags:
`static`

Template:
`read_packet(Input,Packet)`
Mode and number of proofs:

`read_packet(+stream,--compound)` - `one_or_error`

Exceptions:

`Input` ends before a complete packet is read:

`domain_error(mqtt_packet_stream,unexpected_end_of_file)`

`Input` contains an invalid MQTT packet encoding:

`domain_error(mqtt_packet,Packet)`

---

encode_uint8/2

Encodes an unsigned 8-bit integer.

Compilation flags:

`static`

Template:

`encode_uint8(Value,Bytes)`

Mode and number of proofs:

`encode_uint8(+integer,-list(integer))` - `one_or_error`

Exceptions:

`Value` is a variable:

`instantiation_error`

`Value` is neither a variable nor an integer:

`type_error(integer,Value)`

`Value` is outside the unsigned 8-bit integer range:

`domain_error(between(0,255),Value)`

---

decode_uint8/3

Decodes an unsigned 8-bit integer.

Compilation flags:

`static`

Template:

`decode_uint8(Bytes,Value,Rest)`

Mode and number of proofs:

`decode_uint8(+list(integer),-integer,-list(integer))` - `one_or_error`

Exceptions:

The first element of `Bytes` is not a byte:

`type_error(byte,Byte)`

---

encode_uint16/2

Encodes an unsigned 16-bit integer in network byte order.

Compilation flags:
`static`

Template:
`encode_uint16(Value,Bytes)`
Mode and number of proofs:
`encode_uint16(+integer,-list(integer))` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor an integer:
`type_error(integer,Value)`
`Value` is outside the unsigned 16-bit integer range:
`domain_error(between(0,65535),Value)`

---

decode_uint16/3

Decodes an unsigned 16-bit integer in network byte order.

Compilation flags:
`static`

Template:
`decode_uint16(Bytes,Value,Rest)`
Mode and number of proofs:
`decode_uint16(+list(integer),-integer,-list(integer))` - `one_or_error`

Exceptions:
One of the first two elements of `Bytes` is not a byte:
`type_error(byte,Byte)`

---

encode_uint32/2

Encodes an unsigned 32-bit integer in network byte order.

Compilation flags:
`static`

Template:
`encode_uint32(Value,Bytes)`

Mode and number of proofs:

`encode_uint32(+integer,-list(integer))` - `one_or_error`

Exceptions:

`Value` is a variable:

`instantiation_error`

`Value` is neither a variable nor an integer:

`type_error(integer,Value)`

`Value` is outside the unsigned 32-bit integer range:

`domain_error(between(0,4294967295),Value)`

---

decode_uint32/3

Decodes an unsigned 32-bit integer in network byte order.

Compilation flags:

`static`

Template:

`decode_uint32(Bytes,Value,Rest)`

Mode and number of proofs:

`decode_uint32(+list(integer),-integer,-list(integer))` - `one_or_error`

Exceptions:

One of the first four elements of `Bytes` is not a byte:

`type_error(byte,Byte)`

---

encode_varint/2

Encodes an MQTT variable byte integer.

Compilation flags:

`static`

Template:

`encode_varint(Value,Bytes)`

Mode and number of proofs:

`encode_varint(+integer,-list(integer))` - `one_or_error`

Exceptions:

`Value` is a variable:

`instantiation_error`

`Value` is neither a variable nor an integer:

`type_error(integer,Value)`

`Value` is outside the MQTT variable byte integer range:
`domain_error(between(0,268435455),Value)`

`decode_varint/3`

Decodes an MQTT variable byte integer, rejecting non-minimal encodings and overflows.

Compilation flags:
`static`

Template:
`decode_varint(Bytes,Value,Rest)`
Mode and number of proofs:
`decode_varint(+list(integer),-integer,-list(integer))` - `one_or_error`

Exceptions:
`Bytes` does not start with a valid, minimally encoded MQTT variable byte integer:
`domain_error(mqtt_variable_byte_integer,Consumed)`

`encode_utf8_string/2`

Encodes an MQTT UTF-8 encoded string with a two-byte length prefix.

Compilation flags:
`static`

Template:
`encode_utf8_string(String,Bytes)`
Mode and number of proofs:
`encode_utf8_string(+atom,-list(integer))` - `one_or_error`

Exceptions:
`String` is a variable:
`instantiation_error`
`String` is neither a variable nor atom:
`type_error(atom,String)`
`String` is not a valid MQTT UTF-8 string:
`domain_error(mqtt_utf8_string,Codes)`

---

decode_utf8_string/3

Decodes an MQTT UTF-8 encoded string with a two-byte length prefix.

Compilation flags:
`static`

Template:
`decode_utf8_string(Bytes,String,Rest)`
Mode and number of proofs:
`decode_utf8_string(+list(integer),-atom,-list(integer))` - `one_or_error`

Exceptions:
`Bytes` does not start with a valid MQTT UTF-8 string:
`domain_error(mqtt_utf8_string,Codes)`

---

encode_binary_data/2

Encodes MQTT binary data with a two-byte length prefix.

Compilation flags:
`static`

Template:
`encode_binary_data(Data,Bytes)`
Mode and number of proofs:
`encode_binary_data(+list(integer),-list(integer))` - `one_or_error`

Exceptions:
`Data` is not a list of bytes:
`type_error(list(byte),Data)`
`Data` is longer than 65535 bytes:
`domain_error(between(0,65535),Length)`

---

decode_binary_data/3

Decodes MQTT binary data with a two-byte length prefix.

Compilation flags:
`static`

Template:
`decode_binary_data(Bytes,Data,Rest)`
Mode and number of proofs:
`decode_binary_data(+list(integer),-list(integer),-list(integer))` - `one_or_error`

Exceptions:

The first two elements of `Bytes` do not encode a valid length:

`type_error(byte,Byte)`

---

encode_utf8_string_pair/2

Encodes an MQTT UTF-8 string pair as two MQTT UTF-8 encoded strings.

Compilation flags:

`static`

Template:

`encode_utf8_string_pair(Pair,Bytes)`

Mode and number of proofs:

`encode_utf8_string_pair(+compound,-list(integer))` - `one_or_error`

Exceptions:

An element of `Pair` is not an atom:

`type_error(atom,String)`

An element of `Pair` is not a valid MQTT UTF-8 string:

`domain_error(mqtt_utf8_string,Codes)`

---

decode_utf8_string_pair/3

Decodes an MQTT UTF-8 string pair from two MQTT UTF-8 encoded strings.

Compilation flags:

`static`

Template:

`decode_utf8_string_pair(Bytes,Pair,Rest)`

Mode and number of proofs:

`decode_utf8_string_pair(+list(integer),-compound,-list(integer))` - `one_or_error`

Exceptions:

`Bytes` does not start with two valid MQTT UTF-8 strings:

`domain_error(mqtt_utf8_string,Codes)`

---

encode_properties/2

Encodes an MQTT property list with its variable byte integer length prefix.

Compilation flags:
`static`

Template:
`encode_properties(Properties,Bytes)`
Mode and number of proofs:
`encode_properties(+list,-list(integer))` - `one_or_error`

Exceptions:
`Properties` is a variable or a partial list:
`instantiation_error`
`Properties` is neither a variable nor a list:
`type_error(list,Properties)`
An element `Property` is not a supported MQTT property:
`domain_error(mqtt_property,Property)`

---

decode_properties/3

Decodes an MQTT property list and returns the remaining packet bytes.

Compilation flags:
`static`

Template:
`decode_properties(Bytes,Properties,Rest)`
Mode and number of proofs:
`decode_properties(+list(integer),-list,-list(integer))` - `one_or_error`

Exceptions:
`Bytes` does not contain the declared property bytes:
`domain_error(mqtt_properties,Bytes)`
`Bytes` contains an unknown property identifier:
`domain_error(mqtt_property_identifier,Identifier)`

---

encode_property_list/2

Encodes MQTT properties without the property length prefix.

Compilation flags:
`static`

Template:
`encode_property_list(Properties,Bytes)`
Mode and number of proofs:
`encode_property_list(+list,-list(integer))` - `one_or_error`

Exceptions:
An element `Property` is not a supported MQTT property:
`domain_error(mqtt_property,Property)`

---

decode_property_list/2

Decodes MQTT properties from a property body byte list.

Compilation flags:
`static`

Template:
`decode_property_list(Bytes,Properties)`
Mode and number of proofs:
`decode_property_list(+list(integer),-list)` - `one_or_error`

Exceptions:
`Bytes` contains an unknown property identifier:
`domain_error(mqtt_property_identifier,Identifier)`

---

encode_property/2

Encodes a single MQTT property.

Compilation flags:
`static`

Template:
`encode_property(Property,Bytes)`
Mode and number of proofs:
`encode_property(+compound,-list(integer))` - `one_or_error`

Exceptions:

`Property` is not a supported MQTT property:
`domain_error(mqtt_property,Property)`
`Property` contains an invalid value:
`domain_error(mqtt_property_value,Name-Value)`

---

decode_property/3

Decodes a single MQTT property.

Compilation flags:
`static`

Template:
`decode_property(Bytes,Property,Rest)`
Mode and number of proofs:
`decode_property(+list(integer),-compound,-list(integer))` - `one_or_error`

Exceptions:
`Bytes` starts with an unknown property identifier:
`domain_error(mqtt_property_identifier,Identifier)`
`Bytes` contains an invalid property value:
`domain_error(mqtt_property_value,Name-Value)`

---

mqtt_property/3

Table of MQTT property names, identifiers, and value types.

Compilation flags:
`static`

Template:
`mqtt_property(Name,Identifier,Type)`
Mode and number of proofs:
`mqtt_property(?atom,?integer,?atom)` - `zero_or_more`

---

encode_fixed_header/4

Encodes an MQTT fixed header from packet type, flags, and remaining length.

Compilation flags:
`static`

Template:
`encode_fixed_header(Type,Flags,RemainingLength,Bytes)`
Mode and number of proofs:
`encode_fixed_header(+atom,+integer,+integer,-list(integer))` - `one_or_error`

Exceptions:
`Type` is not a supported MQTT packet type:
`domain_error(mqtt_packet_type,Type)`
`Flags` is invalid for `Type`:
`domain_error(mqtt_fixed_header_flags,Type-Flags)`
`RemainingLength` is outside the MQTT variable byte integer range:
`domain_error(between(0,268435455),RemainingLength)`

---

decode_fixed_header/5

Decodes an MQTT fixed header into packet type, flags, remaining length, and remaining bytes.

Compilation flags:
`static`

Template:
`decode_fixed_header(Bytes,Type,Flags,RemainingLength,Rest)`
Mode and number of proofs:
`decode_fixed_header(+list(integer),-atom,-integer,-integer,-list(integer))` - `one_or_error`

Exceptions:
`Bytes` starts with an unsupported MQTT packet type:
`domain_error(mqtt_packet_type,Code)`
`Bytes` contains invalid fixed header flags:
`domain_error(mqtt_fixed_header_flags,Type-Flags)`
`Bytes` contains an invalid MQTT variable byte integer:
`domain_error(mqtt_variable_byte_integer,Consumed)`

Operators

(none)

1.225 mrmr_feature_selector

object

1.225.1 `mrmr_feature_selector`

Minimum redundancy maximum relevance selection using raw mutual information in bits and the MID difference criterion. Learning requires at least two joint complete observations; otherwise it throws `domain_error(mrmr_usable_examples,Count)`.

Availability:
`logtalk_load(mrmr_feature_selector(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-07

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *feature_selector_common*
`public` *feature_redundancy*

Uses:
avltree
list
type

Remarks:
(none)

Inherited public predicates:

multisets/3

Generates all K-multisets (unordered K-element selections with replacement) of a list using default order.

Compilation flags:
`static`

Template:
`multisets(K,List,Multisets)`
Mode and number of proofs:
`multisets(+integer,+list,-list)` - `one`

---

multiset/3

True iff the third argument is a K-multiset with replacement of a list using default order.

Compilation flags:
`static`

Template:
`multiset(K,List,Multiset)`
Mode and number of proofs:
`multiset(+integer,+list,-list)` - `one_or_more`

---

multisets/4

Generates all K-multisets with the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`multisets(K,List,Order,Multisets)`
Mode and number of proofs:
`multisets(+integer,+list,+atom,-list)` - `one`

---

multiset/4

True iff the fourth argument is a K-multiset with replacement with the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`multiset(K,List,Order,Multiset)`
Mode and number of proofs:
`multiset(+integer,+list,+atom,-list)` - `one_or_more`

---

distinct_multisets/3

Generates all distinct K-multisets (deduplicating repeated values in the input list) using default order.

Compilation flags:
`static`

Template:
`distinct_multisets(K,List,Multisets)`
Mode and number of proofs:
`distinct_multisets(+integer,+list,-list)` - `one`

---

distinct_multiset/3

True iff the third argument is a distinct K-multiset with replacement of a list using default order.

Compilation flags:
`static`

Template:
`distinct_multiset(K,List,Multiset)`
Mode and number of proofs:
`distinct_multiset(+integer,+list,-list)` - `one_or_more`

---

distinct_multisets/4

Generates all distinct K-multisets with the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`distinct_multisets(K,List,Order,Multisets)`
Mode and number of proofs:
`distinct_multisets(+integer,+list,+atom,-list)` - `one`

---

distinct_multiset/4

True iff the fourth argument is a distinct K-multiset with replacement with the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`distinct_multiset(K,List,Order,Multiset)`
Mode and number of proofs:
`distinct_multiset(+integer,+list,+atom,-list)` - `one_or_more`

---

nth_multiset/4

Returns the K-multiset at a given zero-based index using default order.

Compilation flags:
`static`

Template:
`nth_multiset(K,List,Index,Multiset)`
Mode and number of proofs:
`nth_multiset(+integer,+list,+integer,-list)` - `zero_or_one`

---

nth_multiset/5

Returns the K-multiset at a given zero-based index in the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`nth_multiset(K,List,Order,Index,Multiset)`
Mode and number of proofs:
`nth_multiset(+integer,+list,+atom,+integer,-list)` - `zero_or_one`

---

multiset_index/4

Returns the zero-based index of a K-multiset using default order.

Compilation flags:
`static`

Template:
`multiset_index(K,List,Multiset,Index)`
Mode and number of proofs:
`multiset_index(+integer,+list,+list,-integer)` - `zero_or_one`

---

multiset_index/5

Returns the zero-based index of a K-multiset in the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`multiset_index(K,List,Order,Multiset,Index)`
Mode and number of proofs:
`multiset_index(+integer,+list,+atom,+list,-integer)` - `zero_or_one`

---

count_multisets/3

Counts the number of K-multisets with replacement of a list.

Compilation flags:
```
static
```

Template:
```
count_multisets(K,List,Count)
```
Mode and number of proofs:
```
count_multisets(+integer,+list,-integer) - one
```

---

count_distinct_multisets/3

Counts the number of distinct K-multisets with replacement of a list (deduplicating repeated values in the input list).

Compilation flags:
```
static
```

Template:
```
count_distinct_multisets(K,List,Count)
```
Mode and number of proofs:
```
count_distinct_multisets(+integer,+list,-integer) - one
```

---

nth_distinct_multiset/4

Returns the distinct K-multiset at a given zero-based index in default generation order.

Compilation flags:
```
static
```

Template:
```
nth_distinct_multiset(K,List,Index,Multiset)
```
Mode and number of proofs:
```
nth_distinct_multiset(+integer,+list,+integer,-list) - zero_or_one
```

---

distinct_multiset_index/4

Returns the zero-based index of a distinct K-multiset in default generation order.

Compilation flags:
```
static
```

Template:
```
distinct_multiset_index(K,List,Multiset,Index)
```
Mode and number of proofs:
```
distinct_multiset_index(+integer,+list,+list,-integer) - zero_or_one
```

---

random_multiset/3

Returns a random K-multiset with replacement of a list.

Compilation flags:
```
static
```

Template:
```
random_multiset(K,List,Multiset)
```
Mode and number of proofs:
```
random_multiset(+integer,+list,-list) - zero_or_one
```

---

sample_multisets/4

Returns SampleCount random K-multisets with replacement of a list, sampled with replacement.

Compilation flags:
```
static
```

Template:
```
sample_multisets(K,List,SampleCount,Samples)
```
Mode and number of proofs:
```
sample_multisets(+integer,+list,+integer,-list) - zero_or_one
```

---

random_distinct_multiset/3

Returns a random distinct K-multiset with replacement of a list (deduplicating repeated values in the input list).

Compilation flags:

```
static
```

Template:

```
random_distinct_multiset(K,List,Multiset)
```

Mode and number of proofs:

```
random_distinct_multiset(+integer,+list,-list) - zero_or_one
```

---

sample_distinct_multisets/4

Returns SampleCount random distinct K-multisets with replacement of a list, sampled with replacement after deduplicating repeated values in the input list.

Compilation flags:

```
static
```

Template:

```
sample_distinct_multisets(K,List,SampleCount,Samples)
```

Mode and number of proofs:

```
sample_distinct_multisets(+integer,+list,+integer,-list) - zero_or_one
```

---

next_multiset/3

Returns the next distinct multiset value in lexicographic order induced by the first argument.

Compilation flags:

```
static
```

Template:

```
next_multiset(List,Multiset,Next)
```

Mode and number of proofs:

```
next_multiset(+list,+list,-list) - zero_or_one
```

---

previous_multiset/3

Returns the previous distinct multiset value in lexicographic order induced by the first argument.

Compilation flags:
`static`

Template:
`previous_multiset(List,Multiset,Previous)`
Mode and number of proofs:
`previous_multiset(+list,+list,-list)` - `zero_or_one`

Public predicates

multivariate_normal/3

Returns a multivariate normally distributed random vector using the default numerical tolerance of 1.0e-12. Singular positive-semidefinite covariance matrices are supported.

Compilation flags:

`static`

Template:

`multivariate_normal(Mean,Covariance,Sample)`

Mode and number of proofs:

`multivariate_normal(+list(number),+list(list(number)),-list(float))` - `one_or_error`

Exceptions:

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

multivariate_normal/4

Returns a multivariate normally distributed random vector using the given non-negative numerical tolerance. Singular positive-semidefinite covariance matrices are supported.

Compilation flags:

`static`

Template:

`multivariate_normal(Mean,Covariance,Tolerance,Sample)`

Mode and number of proofs:

`multivariate_normal(+list(number),+list(list(number)),+number,-list(float))` - `one_or_error`

Exceptions:

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Tolerance` is negative:

`domain_error(non_negative_number,Tolerance)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

multivariate_normal_samples/4

Returns the requested number of multivariate normally distributed random row vectors using the default numerical tolerance of 1.0e-12.

Compilation flags:

`static`

Template:

`multivariate_normal_samples(Count,Mean,Covariance,Samples)`

Mode and number of proofs:

`multivariate_normal_samples(+integer,+list(number),+list(list(number)),-list(list(float)))` - `one_or_error`

Exceptions:

`Count` is a variable:

`instantiation_error`

`Count` is neither a variable nor an integer:

`type_error(integer,Count)`

`Count` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Count)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

multivariate_normal_samples/5

Returns the requested number of multivariate normally distributed random row vectors using the given non-negative numerical tolerance.

Compilation flags:

`static`

Template:

`multivariate_normal_samples(Count,Mean,Covariance,Tolerance,Samples)`

Mode and number of proofs:

`multivariate_normal_samples(+integer,+list(number),+list(list(number)),+number,-list(list(float)))` - `one_or_error`

Exceptions:

`Count` is a variable:

`instantiation_error`

`Count` is neither a variable nor an integer:

`type_error(integer,Count)`

`Count` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Count)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

multivariate_normal_density/4

Computes the multivariate normal density at a point using the default numerical tolerance of 1.0e-12. For a singular covariance matrix, computes the density on its affine support and returns zero outside it.

Compilation flags:

`static`

Template:

`multivariate_normal_density(Point,Mean,Covariance,Density)`

Mode and number of proofs:

`multivariate_normal_density(+list(number),+list(number),+list(list(number)),-float)` - `one_or_error`

Exceptions:

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` dimensions do not match the mean dimension:

`domain_error(point_dimensions(A),Point)`

multivariate_normal_density/5

Computes the multivariate normal density at a point using the given non-negative numerical tolerance. For a singular covariance matrix, computes the density on its affine support and returns zero outside it.

Compilation flags:

`static`

Template:

`multivariate_normal_density(Point,Mean,Covariance,Tolerance,Density)`

Mode and number of proofs:

`multivariate_normal_density(+list(number),+list(number),+list(list(number)),+number,-float)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` dimensions do not match the mean dimension:

`domain_error(point_dimensions(A),Point)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

multivariate_normal_log_density/4

Computes the multivariate normal log-density at a point using the default numerical tolerance of 1.0e-12. Returns the atom `negative_infinity` outside the affine support of a singular covariance matrix.

Compilation flags:

`static`

Template:

`multivariate_normal_log_density(Point,Mean,Covariance,LogDensity)`

Mode and number of proofs:

`multivariate_normal_log_density(+list(number),+list(number),+list(list(number)),-atomic)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` dimensions do not match the mean dimension:

`domain_error(point_dimensions(A),Point)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

multivariate_normal_log_density/5

Computes the multivariate normal log-density at a point using the given non-negative numerical tolerance. Returns the atom `negative_infinity` outside the affine support of a singular covariance matrix.

Compilation flags:

`static`

Template:

`multivariate_normal_log_density(Point,Mean,Covariance,Tolerance,LogDensity)`

Mode and number of proofs:

`multivariate_normal_log_density(+list(number),+list(number),+list(list(number)),+number,-atomic)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` dimensions do not match the mean dimension:

`domain_error(point_dimensions(A),Point)`

`Tolerance` is negative:

`domain_error(non_negative_number,Tolerance)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

---

squared_mahalanobis_distance/4

Computes the squared Mahalanobis distance using the default numerical tolerance of 1.0e-12.

Compilation flags:

`static`

Template:

`squared_mahalanobis_distance(Point,Mean,Covariance,SquaredDistance)`

Mode and number of proofs:

`squared_mahalanobis_distance(+list(number),+list(number),+list(list(number)),-float)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` is outside the affine support of `Covariance`:

`domain_error(covariance_support,Point)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

---

squared_mahalanobis_distance/5

Computes the squared Mahalanobis distance using the given non-negative numerical tolerance.

Compilation flags:

`static`

Template:

`squared_mahalanobis_distance(Point,Mean,Covariance,Tolerance,SquaredDistance)`

Mode and number of proofs:

`squared_mahalanobis_distance(+list(number),+list(number),+list(list(number)),+number,-float)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` is outside the affine support of `Covariance`:

`domain_error(covariance_support,Point)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

mahalanobis_distance/4

Computes the Mahalanobis distance using the default numerical tolerance of 1.0e-12.

Compilation flags:

```
static
```

Template:

```
mahalanobis_distance(Point,Mean,Covariance,Distance)
```

Mode and number of proofs:

```
mahalanobis_distance(+list(number),+list(number),+list(list(number)),-float) -
one_or_error
```

Exceptions:

`Point` is a variable or a partial list:

```
instantiation_error
```

`Point` is neither a partial list nor a list:

```
type_error(list,Point)
```

An element `Element` of the `Point` list is neither a variable nor a number:

```
type_error(number,Element)
```

`Point` is outside the affine support of `Covariance`:

```
domain_error(covariance_support,Point)
```

`Point` dimensions do not match the mean dimension:

```
domain_error(point_dimensions(A),Point)
```

`Mean` is a variable or a partial list:

```
instantiation_error
```

`Mean` is neither a partial list nor a list:

```
type_error(list,Mean)
```

An element `Element` of the `Mean` list is neither a variable nor a number:

```
type_error(number,Element)
```

`Covariance` is a variable or a partial list:

```
instantiation_error
```

`Covariance` is neither a partial list nor a list:

```
type_error(list(list(number)),Covariance)
```

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

```
type_error(list(number),Element)
```

---

mahalanobis_distance/5

Computes the Mahalanobis distance using the given non-negative numerical tolerance.

Compilation flags:

```
static
```

Template:

```
mahalanobis_distance(Point,Mean,Covariance,Tolerance,Distance)
```

Mode and number of proofs:

`mahalanobis_distance(+list(number),+list(number),+list(list(number)),+number,-float)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:
`instantiation_error`
`Point` is neither a partial list nor a list:
`type_error(list,Point)`
An element `Element` of the `Point` list is neither a variable nor a number:
`type_error(number,Element)`
`Point` is outside the affine support of `Covariance`:
`domain_error(covariance_support,Point)`
`Point` dimensions do not match the mean dimension:
`domain_error(point_dimensions(A),Point)`
`Mean` is a variable or a partial list:
`instantiation_error`
`Mean` is neither a partial list nor a list:
`type_error(list,Mean)`
An element `Element` of the `Mean` list is neither a variable nor a number:
`type_error(number,Element)`
`Covariance` is a variable or a partial list:
`instantiation_error`
`Covariance` is neither a partial list nor a list:
`type_error(list(list(number)),Covariance)`
An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:
`type_error(list(number),Element)`
`Tolerance` is a variable:
`instantiation_error`
`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`Tolerance` is a nuber but not a non-negative number:
`domain_error(non_negative_number,Tolerance)`

`multivariate_t/4`

Returns a multivariate Student's t distributed random vector using the default numerical tolerance of 1.0e-12.

Compilation flags:
`static`

Template:
`multivariate_t(DegreesOfFreedom,Location,Scale,Sample)`
Mode and number of proofs:
`multivariate_t(+positive_number,+list(number),+list(list(number)),-list(float))` - `one_or_error`

Exceptions:

`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor an integer:
`type_error(integer,DegreesOfFreedom)`
`DegreesOfFreedom` is not a positive integer:
`domain_error(positive_number,DegreesOfFreedom)`
`Location` is empty:
`domain_error(minimum_number_of_values(1),Location)`
`Scale` dimensions do not match the location dimension:
`domain_error(covariance_dimensions(A),Scale)`
`Scale` is not symmetric:
`domain_error(symmetric_matrix,Scale)`
`Scale` is not positive semidefinite:
`domain_error(positive_semidefinite_matrix,Scale)`

`multivariate_t/5`

Returns a multivariate Student's t distributed random vector using the given non-negative numerical tolerance.

Compilation flags:
`static`

Template:
`multivariate_t(DegreesOfFreedom,Location,Scale,Tolerance,Sample)`
Mode and number of proofs:
`multivariate_t(+positive_number,+list(number),+list(list(number)),+number,-list(float))` - `one_or_error`

Exceptions:
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`
`Tolerance` is negative:
`domain_error(non_negative_number,Tolerance)`
`Location` is empty:
`domain_error(minimum_number_of_values(1),Location)`
`Scale` dimensions do not match the location dimension:
`domain_error(covariance_dimensions(A),Scale)`
`Scale` is not symmetric:
`domain_error(symmetric_matrix,Scale)`
`Scale` is not positive semidefinite:
`domain_error(positive_semidefinite_matrix,Scale)`
`Tolerance` is a variable:
`instantiation_error`

`Tolerance` is neither a variable nor a number:
`type_error(number,Tolerance)`
`Tolerance` is a nuber but not a non-negative number:
`domain_error(non_negative_number,Tolerance)`

`multivariate_t_samples/5`

Returns the requested number of multivariate Student's t distributed random row vectors using the default numerical tolerance of 1.0e-12.

Compilation flags:
`static`

Template:
`multivariate_t_samples(Count,DegreesOfFreedom,Location,Scale,Samples)`
Mode and number of proofs:
`multivariate_t_samples(+integer,+positive_number,+list(number),`
`+list(list(number)),-list(list(float)))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`
`Location` is empty:
`domain_error(minimum_number_of_values(1),Location)`
`Scale` dimensions do not match the location dimension:
`domain_error(covariance_dimensions(A),Scale)`
`Scale` is not symmetric:
`domain_error(symmetric_matrix,Scale)`
`Scale` is not positive semidefinite:
`domain_error(positive_semidefinite_matrix,Scale)`

---

multivariate_t_samples/6

Returns the requested number of multivariate Student's t distributed random row vectors using the given non-negative numerical tolerance.

Compilation flags:

```
static
```

Template:

```
multivariate_t_samples(Count,DegreesOfFreedom,Location,Scale,Tolerance,Samples)
```

Mode and number of proofs:

```
multivariate_t_samples(+integer,+positive_number,+list(number),
+list(list(number)),+number,-list(list(float))) - one_or_error
```

Exceptions:

`Count` is a variable:

```
instantiation_error
```

`Count` is neither a variable nor an integer:

```
type_error(integer,Count)
```

`Count` is a negative integer:

```
domain_error(non_negative_integer,Count)
```

`DegreesOfFreedom` is a variable:

```
instantiation_error
```

`DegreesOfFreedom` is neither a variable nor a number:

```
type_error(number,DegreesOfFreedom)
```

`DegreesOfFreedom` is a number but not a positive number:

```
domain_error(positive_number,DegreesOfFreedom)
```

`Tolerance` is negative:

```
domain_error(non_negative_number,Tolerance)
```

`Location` is empty:

```
domain_error(minimum_number_of_values(1),Location)
```

`Scale` dimensions do not match the location dimension:

```
domain_error(covariance_dimensions(A),Scale)
```

`Scale` is not symmetric:

```
domain_error(symmetric_matrix,Scale)
```

`Scale` is not positive semidefinite:

```
domain_error(positive_semidefinite_matrix,Scale)
```

`Tolerance` is a variable:

```
instantiation_error
```

`Tolerance` is neither a variable nor a number:

```
type_error(number,Tolerance)
```

`Tolerance` is a nuber but not a non-negative number:

```
domain_error(non_negative_number,Tolerance)
```

multivariate_t_density/5

Computes the multivariate Student's t density using the default numerical tolerance of 1.0e-12. Returns zero outside the affine support of a singular scale matrix.

Compilation flags:

`static`

Template:

`multivariate_t_density(Point,DegreesOfFreedom,Location,Scale,Density)`

Mode and number of proofs:

`multivariate_t_density(+list(number),+positive_number,+list(number),+list(list(number)),-float)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` dimensions do not match the location dimension:

`domain_error(point_dimensions(A),Point)`

`DegreesOfFreedom` is a variable:

`instantiation_error`

`DegreesOfFreedom` is neither a variable nor a number:

`type_error(number,DegreesOfFreedom)`

`DegreesOfFreedom` is a number but not a positive number:

`domain_error(positive_number,DegreesOfFreedom)`

`Location` is empty:

`domain_error(minimum_number_of_values(1),Location)`

`Scale` dimensions do not match the location dimension:

`domain_error(covariance_dimensions(A),Scale)`

`Scale` is not symmetric:

`domain_error(symmetric_matrix,Scale)`

`Scale` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Scale)`

---

multivariate_t_density/6

Computes the multivariate Student's t density using the given non-negative numerical tolerance. Returns zero outside the affine support of a singular scale matrix.

Compilation flags:

`static`

Template:

`multivariate_t_density(Point,DegreesOfFreedom,Location,Scale,Tolerance,Density)`

Mode and number of proofs:

`multivariate_t_density(+list(number),+positive_number,+list(number),+list(list(number)),+number,-float)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Point` dimensions do not match the location dimension:

`domain_error(point_dimensions(A),Point)`

`DegreesOfFreedom` is a variable:

`instantiation_error`

`DegreesOfFreedom` is neither a variable nor a number:

`type_error(number,DegreesOfFreedom)`

`DegreesOfFreedom` is a number but not a positive number:

`domain_error(positive_number,DegreesOfFreedom)`

`Location` is empty:

`domain_error(minimum_number_of_values(1),Location)`

`Scale` dimensions do not match the location dimension:

`domain_error(covariance_dimensions(A),Scale)`

`Scale` is not symmetric:

`domain_error(symmetric_matrix,Scale)`

`Scale` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Scale)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

`multivariate_t_log_density/5`

Computes the multivariate Student's t log-density using the default numerical tolerance of 1.0e-12. Returns `negative_infinity` outside singular affine support.

Compilation flags:

`static`

Template:

`multivariate_t_log_density(Point,DegreesOfFreedom,Location,Scale,LogDensity)`

Mode and number of proofs:

`multivariate_t_log_density(+list(number),+positive_number,+list(number),+list(list(number)),-atomic)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

```
instantiation_error
```

`Point` is neither a partial list nor a list:

```
type_error(list,Point)
```

An element `Element` of the `Point` list is neither a variable nor a number:

```
type_error(number,Element)
```

`Point` dimensions do not match the location dimension:

```
domain_error(point_dimensions(A),Point)
```

`DegreesOfFreedom` is a variable:

```
instantiation_error
```

`DegreesOfFreedom` is neither a variable nor a number:

```
type_error(number,DegreesOfFreedom)
```

`DegreesOfFreedom` is a number but not a positive number:

```
domain_error(positive_number,DegreesOfFreedom)
```

`Location` is empty:

```
domain_error(minimum_number_of_values(1),Location)
```

`Scale` dimensions do not match the location dimension:

```
domain_error(covariance_dimensions(A),Scale)
```

`Scale` is not symmetric:

```
domain_error(symmetric_matrix,Scale)
```

`Scale` is not positive semidefinite:

```
domain_error(positive_semidefinite_matrix,Scale)
```

`multivariate_t_log_density/6`

Computes the multivariate Student's t log-density using the given non-negative numerical tolerance. Returns `negative_infinity` outside singular affine support.

Compilation flags:

```
static
```

Template:

```
multivariate_t_log_density(Point,DegreesOfFreedom,Location,Scale,Tolerance,
LogDensity)
```

Mode and number of proofs:

```
multivariate_t_log_density(+list(number),+positive_number,+list(number),
+list(list(number)),+number,-atomic) - one_or_error
```

Exceptions:

`Point` is a variable or a partial list:

```
instantiation_error
```

`Point` is neither a partial list nor a list:

```
type_error(list,Point)
```

An element `Element` of the `Point` list is neither a variable nor a number:

```
type_error(number,Element)
```

`Point` dimensions do not match the location dimension:

`domain_error(point_dimensions(A),Point)`

`DegreesOfFreedom` is a variable:

`instantiation_error`

`DegreesOfFreedom` is neither a variable nor a number:

`type_error(number,DegreesOfFreedom)`

`DegreesOfFreedom` is a number but not a positive number:

`domain_error(positive_number,DegreesOfFreedom)`

`Location` is empty:

`domain_error(minimum_number_of_values(1),Location)`

`Scale` dimensions do not match the location dimension:

`domain_error(covariance_dimensions(A),Scale)`

`Scale` is not symmetric:

`domain_error(symmetric_matrix,Scale)`

`Scale` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Scale)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

`logistic_normal/3`

Returns an additive-log-ratio logistic-normal random vector using the default numerical tolerance of 1.0e-12. A latent vector of length d maps to a simplex vector of length d+1 using the final component as reference.

Compilation flags:

`static`

Template:

`logistic_normal(Mean,Covariance,Sample)`

Mode and number of proofs:

`logistic_normal(+list(number),+list(list(number)),-list(float))` - `one_or_error`

Exceptions:

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`
An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:
`type_error(list(number),Element)`
`Covariance` dimensions do not match the mean dimension:
`domain_error(covariance_dimensions(A),Covariance)`
`Covariance` is not symmetric:
`domain_error(symmetric_matrix,Covariance)`
`Covariance` is not positive semidefinite:
`domain_error(positive_semidefinite_matrix,Covariance)`

`logistic_normal/4`

Returns an additive-log-ratio logistic-normal random vector using the given non-negative numerical tolerance.

Compilation flags:
`static`

Template:
`logistic_normal(Mean,Covariance,Tolerance,Sample)`
Mode and number of proofs:
`logistic_normal(+list(number),+list(list(number)),+number,-list(float))` - `one_or_error`

Exceptions:
`Mean` is a variable or a partial list:
`instantiation_error`
`Mean` is neither a partial list nor a list:
`type_error(list,Mean)`
An element `Element` of the `Mean` list is neither a variable nor a number:
`type_error(number,Element)`
`Mean` is empty:
`domain_error(minimum_number_of_values(1),Mean)`
`Covariance` is a variable or a partial list:
`instantiation_error`
`Covariance` is neither a partial list nor a list:
`type_error(list(list(number)),Covariance)`
An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:
`type_error(list(number),Element)`
`Covariance` dimensions do not match the mean dimension:
`domain_error(covariance_dimensions(A),Covariance)`
`Covariance` is not symmetric:
`domain_error(symmetric_matrix,Covariance)`
`Covariance` is not positive semidefinite:
`domain_error(positive_semidefinite_matrix,Covariance)`
`Tolerance` is a variable:
`instantiation_error`
`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

`logistic_normal_samples/4`

Returns the requested number of additive-log-ratio logistic-normal random row vectors using the default numerical tolerance of 1.0e-12.

Compilation flags:

`static`

Template:

`logistic_normal_samples(Count,Mean,Covariance,Samples)`

Mode and number of proofs:

`logistic_normal_samples(+integer,+list(number),+list(list(number)),-list(list(float)))` - `one_or_error`

Exceptions:

`Count` is a variable:

`instantiation_error`

`Count` is neither a variable nor an integer:

`type_error(integer,Count)`

`Count` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Count)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

---

logistic_normal_samples/5

Returns the requested number of additive-log-ratio logistic-normal random row vectors using the given non-negative numerical tolerance.

Compilation flags:

`static`

Template:

`logistic_normal_samples(Count,Mean,Covariance,Tolerance,Samples)`

Mode and number of proofs:

`logistic_normal_samples(+integer,+list(number),+list(list(number)),+number,-list(list(float)))` - `one_or_error`

Exceptions:

`Count` is a variable:

`instantiation_error`

`Count` is neither a variable nor an integer:

`type_error(integer,Count)`

`Count` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Count)`

`Mean` is a variable or a partial list:

`instantiation_error`

`Mean` is neither a partial list nor a list:

`type_error(list,Mean)`

An element `Element` of the `Mean` list is neither a variable nor a number:

`type_error(number,Element)`

`Mean` is empty:

`domain_error(minimum_number_of_values(1),Mean)`

`Covariance` is a variable or a partial list:

`instantiation_error`

`Covariance` is neither a partial list nor a list:

`type_error(list(list(number)),Covariance)`

An element `Element` of the `Covariance` list is neither a variable nor a list of numbers:

`type_error(list(number),Element)`

`Covariance` dimensions do not match the mean dimension:

`domain_error(covariance_dimensions(A),Covariance)`

`Covariance` is not symmetric:

`domain_error(symmetric_matrix,Covariance)`

`Covariance` is not positive semidefinite:

`domain_error(positive_semidefinite_matrix,Covariance)`

`Tolerance` is a variable:

`instantiation_error`

`Tolerance` is neither a variable nor a number:

`type_error(number,Tolerance)`

`Tolerance` is a nuber but not a non-negative number:

`domain_error(non_negative_number,Tolerance)`

dirichlet/2

Returns a Dirichlet distributed random vector on the simplex.

Compilation flags:
`static`

Template:
`dirichlet(Alphas,Sample)`
Mode and number of proofs:
`dirichlet(+list(positive_number),-list(float))` - `one_or_error`

Exceptions:
`Alphas` is a variable or a partial list:
`instantiation_error`
`Alphas` is neither a partial list nor a list:
`type_error(list,Alphas)`
An element `Element` of the `Alphas` list is neither a variable nor a number:
`type_error(number,Element)`
An element `Element` of the `Alphas` list is not positive:
`domain_error(positive_number,Element)`
`Alphas` has fewer than two elements:
`domain_error(minimum_number_of_values(2),Alphas)`

---

dirichlet_samples/3

Returns the requested number of Dirichlet distributed random vectors.

Compilation flags:
`static`

Template:
`dirichlet_samples(Count,Alphas,Samples)`
Mode and number of proofs:
`dirichlet_samples(+integer,+list(positive_number),-list(list(float)))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`Alphas` is a variable or a partial list:
`instantiation_error`
`Alphas` is neither a partial list nor a list:

`type_error(list,Alphas)`

An element `Element` of the `Alphas` list is neither a variable nor a number:

`type_error(number,Element)`

An element `Element` of the `Alphas` list is not positive:

`domain_error(positive_number,Element)`

`Alphas` has fewer than two elements:

`domain_error(minimum_number_of_values(2),Alphas)`

---

dirichlet_density/3

Computes the Dirichlet density at a point on the simplex. At a boundary, returns the atom `positive_infinity` when all non-unit alphas corresponding to zero components are smaller than one, zero when they are all greater than one, or `undefined` when both cases occur.

Compilation flags:

`static`

Template:

`dirichlet_density(Point,Alphas,Density)`

Mode and number of proofs:

`dirichlet_density(+list(number),+list(positive_number),-atomic)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Alphas` is a variable or a partial list:

`instantiation_error`

`Alphas` is neither a partial list nor a list:

`type_error(list,Alphas)`

An element `Element` of the `Alphas` list is neither a variable nor a number:

`type_error(number,Element)`

An element `Element` of the `Alphas` list is not positive:

`domain_error(positive_number,Element)`

`Point` and `Alphas` have different lengths:

`domain_error(dimension_mismatch,Point)`

`Alphas` has fewer than two elements:

`domain_error(minimum_number_of_values(2),Alphas)`

---

dirichlet_log_density/3

Computes the Dirichlet log-density at a point on the simplex. At a boundary, returns the atom `positive_infinity` when all non-unit alphas corresponding to zero components are smaller than one, `negative_infinity` when they are all greater than one, or `undefined` when both cases occur.

Compilation flags:

`static`

Template:

`dirichlet_log_density(Point,Alphas,LogDensity)`

Mode and number of proofs:

`dirichlet_log_density(+list(number),+list(positive_number),-atomic)` - `one_or_error`

Exceptions:

`Point` is a variable or a partial list:

`instantiation_error`

`Point` is neither a partial list nor a list:

`type_error(list,Point)`

An element `Element` of the `Point` list is neither a variable nor a number:

`type_error(number,Element)`

`Alphas` is a variable or a partial list:

`instantiation_error`

`Alphas` is neither a partial list nor a list:

`type_error(list,Alphas)`

An element `Element` of the `Alphas` list is neither a variable nor a number:

`type_error(number,Element)`

An element `Element` of the `Alphas` list is not positive:

`domain_error(positive_number,Element)`

`Point` and `Alphas` have different lengths:

`domain_error(dimension_mismatch,Point)`

`Alphas` has fewer than two elements:

`domain_error(minimum_number_of_values(2),Alphas)`

---

multinomial/3

Returns a multinomial distributed random count vector.

Compilation flags:

`static`

Template:

`multinomial(Trials,Probabilities,Counts)`

Mode and number of proofs:

`multinomial(+non_negative_integer,+list(probability),-list(non_negative_integer))` - `one_or_error`

Exceptions:

`Trials` is a variable:
`instantiation_error`
`Trials` is neither a variable nor an integer:
`type_error(integer,Trials)`
`Trials` is a negative integer:
`domain_error(non_negative_integer,Trials)`
`Probabilities` is a variable or a partial list:
`instantiation_error`
`Probabilities` is neither a partial list nor a list:
`type_error(list,Probabilities)`
An element `Element` of the `Probabilities` list is neither a variable nor a float:
`type_error(float,Element)`
An element `Element` of the `Probabilities` list is a float but not a probability:
`domain_error(probability,Element)`
`Probabilities` is empty:
`domain_error(minimum_number_of_values(1),Probabilities)`
`Probabilities` do not sum to one:
`domain_error(probability_distribution,Probabilities)`

`multinomial_samples/4`

Returns the requested number of multinomial distributed random count vectors.

Compilation flags:
`static`

Template:
`multinomial_samples(Count,Trials,Probabilities,Samples)`
Mode and number of proofs:
`multinomial_samples(+integer,+non_negative_integer,+list(probability),-list(list(non_negative_integer)))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`Trials` is a variable:
`instantiation_error`
`Trials` is neither a variable nor an integer:
`type_error(integer,Trials)`
`Trials` is a negative integer:
`domain_error(non_negative_integer,Trials)`
`Probabilities` is a variable or a partial list:
`instantiation_error`

`Probabilities` is neither a partial list nor a list:
`type_error(list,Probabilities)`
An element `Element` of the `Probabilities` list is neither a variable nor a float:
`type_error(float,Element)`
An element `Element` of the `Probabilities` list is a float but not a probability:
`domain_error(probability,Element)`
`Probabilities` is empty:
`domain_error(minimum_number_of_values(1),Probabilities)`
`Probabilities` do not sum to one:
`domain_error(probability_distribution,Probabilities)`

`multinomial_density/4`

Computes the multinomial probability mass at the given count vector.

Compilation flags:
`static`

Template:
`multinomial_density(Counts,Trials,Probabilities,Density)`
Mode and number of proofs:
`multinomial_density(+list(non_negative_integer),+non_negative_integer,`
`+list(probability),-float)` - `one_or_error`

Exceptions:
`Counts` is a variable or a partial list:
`instantiation_error`
`Counts` is neither a partial list nor a list:
`type_error(list,Counts)`
An element `Element` of the `Counts` list is neither a variable nor an integer:
`type_error(integer,Element)`
An element `Element` of the `Counts` list is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Element)`
`Trials` is a variable:
`instantiation_error`
`Trials` is neither a variable nor an integer:
`type_error(integer,Trials)`
`Trials` is a negative integer:
`domain_error(non_negative_integer,Trials)`
`Probabilities` is a variable or a partial list:
`instantiation_error`
`Probabilities` is neither a partial list nor a list:
`type_error(list,Probabilities)`
An element `Element` of the `Probabilities` list is neither a variable nor a float:
`type_error(float,Element)`
An element `Element` of the `Probabilities` list is a float but not a probability:
`domain_error(probability,Element)`

`Probabilities` is empty:
`domain_error(minimum_number_of_values(1),Probabilities)`
`Probabilities` do not sum to one:
`domain_error(probability_distribution,Probabilities)`
`Counts` and `Probabilities` have different lengths:
`domain_error(dimension_mismatch,Counts)`

---

multinomial_log_density/4

Computes the multinomial log-probability mass at the given count vector. Returns the atom `negative_infinity` for an impossible count vector.

Compilation flags:
`static`

Template:
`multinomial_log_density(Counts,Trials,Probabilities,LogDensity)`
Mode and number of proofs:
`multinomial_log_density(+list(non_negative_integer),+non_negative_integer,+list(probability),-atomic)` - `one_or_error`

Exceptions:
`Counts` is a variable or a partial list:
`instantiation_error`
`Counts` is neither a partial list nor a list:
`type_error(list,Counts)`
An element `Element` of the `Counts` list is neither a variable nor an integer:
`type_error(integer,Element)`
An element `Element` of the `Counts` list is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Element)`
`Trials` is a variable:
`instantiation_error`
`Trials` is neither a variable nor an integer:
`type_error(integer,Trials)`
`Trials` is a negative integer:
`domain_error(non_negative_integer,Trials)`
`Probabilities` is a variable or a partial list:
`instantiation_error`
`Probabilities` is neither a partial list nor a list:
`type_error(list,Probabilities)`
An element `Element` of the `Probabilities` list is neither a variable nor a float:
`type_error(float,Element)`
An element `Element` of the `Probabilities` list is a float but not a probability:
`domain_error(probability,Element)`
`Probabilities` is empty:
`domain_error(minimum_number_of_values(1),Probabilities)`
`Probabilities` do not sum to one:

`domain_error(probability_distribution,Probabilities)`

`Counts` and `Probabilities` have different lengths:

`domain_error(dimension_mismatch,Counts)`

`multinomial_quantile/4`

Computes a multinomial quantile (count vector) for a probability strictly between zero and one. Count vectors are ordered by decreasing probability mass and then by increasing lexicographic order for log-probabilities equal within a relative tolerance of 1.0e-12. The returned vector is the first whose cumulative probability mass is at least the requested probability. The exact computation is limited to 100000 count vectors.

Compilation flags:

`static`

Template:

`multinomial_quantile(Probability,Trials,Probabilities,Quantile)`

Mode and number of proofs:

`multinomial_quantile(+open_probability,+non_negative_integer,+list(probability),-list(non_negative_integer))` - `one_or_error`

Exceptions:

`Probability` is a variable:

`instantiation_error`

`Probability` is neither a variable nor a float:

`type_error(float,Probability)`

`Probability` is a float but not strictly between zero and one:

`domain_error(open_probability,Probability)`

`Trials` is a variable:

`instantiation_error`

`Trials` is neither a variable nor an integer:

`type_error(integer,Trials)`

`Trials` is a negative integer:

`domain_error(non_negative_integer,Trials)`

`Probabilities` is a variable or a partial list:

`instantiation_error`

`Probabilities` is neither a partial list nor a list:

`type_error(list,Probabilities)`

An element `Element` of the `Probabilities` list is neither a variable nor a float:

`type_error(float,Element)`

An element `Element` of the `Probabilities` list is a float but not a probability:

`domain_error(probability,Element)`

`Probabilities` is empty:

`domain_error(minimum_number_of_values(1),Probabilities)`

`Probabilities` do not sum to one:

`domain_error(probability_distribution,Probabilities)`

The number of count vectors exceeds the supported limit:

`resource_error(multinomial_quantile_compositions)`

1.228 mutation_testing

object

1.228.1 arithmetic_operator_replacement(Entity,Predicate,ClauseIndex,Occurrence,PrintMutation)

- `Entity` - Identifier of the entity being mutated.
- `Predicate` - Predicate or non-terminal indicator selecting clauses to mutate.
- `ClauseIndex` - 1-based clause index for the selected mutation (equal to `Occurrence` for this mutator).
- `Occurrence` - 1-based mutation occurrence index to target within selected predicate clauses.
- `PrintMutation` - Boolean flag to print the original and mutated term plus source location.

Hook object implementing the `arithmetic_operator_replacement` mutator for matching predicate clauses.

Public predicates

library/1

Runs mutation testing for all loaded entities from a given library using default options.

Compilation flags:
`static`

Template:
`library(Library)`
Mode and number of proofs:
`library(+atom)` - `zero_or_one`

---

library/2

Runs mutation testing for all loaded entities from a given library using the given options.

Compilation flags:
`static`

Template:
`library(Library,Options)`
Mode and number of proofs:
`library(+atom,+list(compound))` - `zero_or_one`

---

directory/1

Runs mutation testing for all loaded entities from a given directory using default options.

Compilation flags:
`static`

Template:
`directory(Directory)`
Mode and number of proofs:
`directory(+atom)` - `zero_or_one`

---

directory/2

Runs mutation testing for all loaded entities from a given directory using the given options.

Compilation flags:
`static`

Template:
`directory(Directory,Options)`
Mode and number of proofs:
`directory(+atom,+list(compound))` - `zero_or_one`

---

entity/1

Runs mutation testing for a loaded entity using default options.

Compilation flags:
`static`

Template:
`entity(Entity)`
Mode and number of proofs:
`entity(+entity_identifier)` - `zero_or_one`

---

entity/2

Runs mutation testing for a loaded entity using the given options.

Compilation flags:
`static`

Template:
`entity(Entity,Options)`
Mode and number of proofs:
`entity(+entity_identifier,+list(compound))` - `zero_or_one`

---

predicate/2

Runs mutation testing for a loaded entity predicate using default options.

Compilation flags:
```
static
```

Template:
```
predicate(Entity,Predicate)
```
Mode and number of proofs:
```
predicate(+entity_identifier,+predicate_indicator) - zero_or_one
```

---

predicate/3

Runs mutation testing for a loaded entity predicate using the given options.

Compilation flags:
```
static
```

Template:
```
predicate(Entity,Predicate,Options)
```
Mode and number of proofs:
```
predicate(+entity_identifier,+predicate_indicator,+list(compound)) - zero_or_one
```

---

report_entity/3

Runs mutation testing for an entity and returns a structured report term.

Compilation flags:
```
static
```

Template:
```
report_entity(Entity,Report,Options)
```
Mode and number of proofs:
```
report_entity(+entity_identifier,-compound,+list(compound)) - zero_or_one
```

---

report_predicate/4

Runs mutation testing for an entity predicate and returns a structured report term.

Compilation flags:
`static`

Template:
`report_predicate(Entity,Predicate,Report,Options)`
Mode and number of proofs:
`report_predicate(+entity_identifier,+predicate_indicator,-compound,+list(compound))` - `zero_or_one`

---

report_library/3

Runs mutation testing for loaded entities from a library and returns structured report terms.

Compilation flags:
`static`

Template:
`report_library(Library,Report,Options)`
Mode and number of proofs:
`report_library(+atom,-compound,+list(compound))` - `zero_or_one`

---

report_directory/3

Runs mutation testing for loaded entities from a directory and returns structured report terms.

Compilation flags:
`static`

Template:
`report_directory(Directory,Report,Options)`
Mode and number of proofs:
`report_directory(+atom,-compound,+list(compound))` - `zero_or_one`

---

format_report/3

Formats a mutation testing report term to the given stream using the given format.

Compilation flags:

```
static
```

Template:

```
format_report(Stream,Format,Report)
```

Mode and number of proofs:

```
format_report(+stream_or_alias,+atom,+compound) - one
```

---

format_report/2

Formats a mutation testing report term to the current output stream using the given format.

Compilation flags:

```
static
```

Template:

```
format_report(Format,Report)
```

Mode and number of proofs:

```
format_report(+atom,+compound) - one
```

---

format_report/1

Formats a mutation testing report term to the current output stream using the text format.

Compilation flags:

```
static
```

Template:

```
format_report(Report)
```

Mode and number of proofs:

```
format_report(+compound) - one
```

---

entity_mutants/2

Returns the deterministic list of mutants for an entity using default options.

Compilation flags:
`static`

Template:
`entity_mutants(Entity,Mutants)`
Mode and number of proofs:
`entity_mutants(+entity_identifier,-list(compound))` - `zero_or_one`

---

entity_mutants/3

Returns the deterministic list of mutants for an entity using the given options.

Compilation flags:
`static`

Template:
`entity_mutants(Entity,Mutants,Options)`
Mode and number of proofs:
`entity_mutants(+entity_identifier,-list(compound),+list(compound))` - `zero_or_one`

---

predicate_mutants/3

Returns the deterministic list of mutants for an entity predicate using default options.

Compilation flags:
`static`

Template:
`predicate_mutants(Entity,Predicate,Mutants)`
Mode and number of proofs:
`predicate_mutants(+entity_identifier,+predicate_indicator,-list(compound))` - `zero_or_one`

---

predicate_mutants/4

Returns the deterministic list of mutants for an entity predicate using the given options.

Compilation flags:
```
static
```

Template:
```
predicate_mutants(Entity,Predicate,Mutants,Options)
```
Mode and number of proofs:
```
predicate_mutants(+entity_identifier,+predicate_indicator,-list(compound),
+list(compound)) - zero_or_one
```

---

library_mutants/2

Returns the deterministic list of mutants for loaded entities from a given library using default options.

Compilation flags:
```
static
```

Template:
```
library_mutants(Library,Mutants)
```
Mode and number of proofs:
```
library_mutants(+atom,-list(compound)) - zero_or_one
```

---

library_mutants/3

Returns the deterministic list of mutants for loaded entities from a given library using the given options.

Compilation flags:
```
static
```

Template:
```
library_mutants(Library,Mutants,Options)
```
Mode and number of proofs:
```
library_mutants(+atom,-list(compound),+list(compound)) - zero_or_one
```

---

directory_mutants/2

Returns the deterministic list of mutants for loaded entities from a given directory using default options.

Compilation flags:
```
static
```

Template:
```
directory_mutants(Directory,Mutants)
```
Mode and number of proofs:
```
directory_mutants(+atom,-list(compound)) - zero_or_one
```

---

directory_mutants/3

Returns the deterministic list of mutants for loaded entities from a given directory using the given options.

Compilation flags:
```
static
```

Template:
```
directory_mutants(Directory,Mutants,Options)
```
Mode and number of proofs:
```
directory_mutants(+atom,-list(compound),+list(compound)) - zero_or_one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

probe_mutation_happened_/0

True iff a mutation happened.

Compilation flags:
```
dynamic
```

Mode and number of proofs:
```
probe_mutation_happened_ - zero_or_one
```

---

probing_/0

True iff we are currently probing for mutations (suppresses printing).

Compilation flags:
dynamic

Mode and number of proofs:
probing_ - zero_or_one

---

capturing_mutated_terms_/0

True iff we are capturing original and mutated terms while formatting reports.

Compilation flags:
dynamic

Mode and number of proofs:
capturing_mutated_terms_ - zero_or_one

---

captured_mutated_terms_/5

Captured original and mutated terms, variable names, and source location for one mutant.

Compilation flags:
dynamic

Template:
captured_mutated_terms_(Original,Mutation,Variables,File,Lines)
Mode and number of proofs:
captured_mutated_terms_(-callable,-callable,-list,-atom,-compound) - zero_or_one

---

baseline_coverage_/4

Coverage baseline cache for an entity and predicate: covered clauses and total clauses.

Compilation flags:
dynamic

Template:
baseline_coverage_(Entity,Predicate,CoveredClauses,TotalClauses)
Mode and number of proofs:

`baseline_coverage_(?entity_identifier,?predicate_indicator,?list(integer),?integer)` - `zero_or_more`

Operators

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

print_mutation/3

Prints a term and its mutation when `Flag` is true. Succeeds otherwise.

Compilation flags:
`static`

Template:
`print_mutation(Flag,Original,Mutation)`
Mode and number of proofs:
`print_mutation(+boolean,@callable,@callable) - one`

---

target_predicate/3

True iff `Term` is a candidate for mutation.

Compilation flags:
`static`

Template:
`target_predicate(Term,Entity,Predicate)`
Mode and number of proofs:
`target_predicate(@callable,@entity_identifier,@predicate_indicator) - one`

---

target_predicate_clause_index/4

True iff `Term` is a candidate for mutation while also returning its current 1-based contiguous clause index for the matching predicate or non-terminal.

Compilation flags:

```
static
```

Template:

```
target_predicate_clause_index(Term,Entity,Predicate,ClauseIndex)
```

Mode and number of proofs:

```
target_predicate_clause_index(@callable,@entity_identifier,@predicate_indicator,
-integer) - zero_or_one
```

---

target_scope_directive/3

True iff `Term` is a matching predicate or non-terminal scope directive candidate for mutation.

Compilation flags:

```
static
```

Template:

```
target_scope_directive(Term,Entity,Predicate)
```

Mode and number of proofs:

```
target_scope_directive(@callable,@entity_identifier,@predicate_indicator) - one
```

---

target_scope_directive_index/4

True iff `Term` is a matching predicate or non-terminal scope directive candidate for mutation while also returning its 1-based index among matching scope directives for the selected predicate or non-terminal.

Compilation flags:

```
static
```

Template:

```
target_scope_directive_index(Term,Entity,Predicate,DirectiveIndex)
```

Mode and number of proofs:

```
target_scope_directive_index(@callable,@entity_identifier,@predicate_indicator,
-integer) - zero_or_one
```

---

target_predicate_directive/3

True iff `Term` is a matching predicate or non-terminal directive candidate for mutation.

Compilation flags:
`static`

Template:
`target_predicate_directive(Term,Entity,Predicate)`
Mode and number of proofs:
`target_predicate_directive(@callable,@entity_identifier,@predicate_indicator)` - `one`

---

target_predicate_directive_index/4

True iff `Term` is a matching predicate or non-terminal directive candidate for mutation while also returning its 1-based index among matching directives for the selected predicate or non-terminal.

Compilation flags:
`static`

Template:
`target_predicate_directive_index(Term,Entity,Predicate,DirectiveIndex)`
Mode and number of proofs:
`target_predicate_directive_index(@callable,@entity_identifier,@predicate_indicator,-integer)` - `zero_or_one`

---

target_uses_directive/3

True iff `Term` is a matching `uses/2` directive candidate for mutation.

Compilation flags:
`static`

Template:
`target_uses_directive(Term,Entity,Predicate)`
Mode and number of proofs:
`target_uses_directive(@callable,@entity_identifier,@predicate_indicator)` - `one`

---

target_uses_directive_index/4

True iff `Term` is a matching `uses/2` directive candidate for mutation while also returning its 1-based index among matching directives for the selected predicate or non-terminal.

Compilation flags:

```
static
```

Template:

```
target_uses_directive_index(Term,Entity,Predicate,DirectiveIndex)
```

Mode and number of proofs:

```
target_uses_directive_index(@callable,@entity_identifier,@predicate_indicator,
-integer) - zero_or_one
```

---

next_occurrence/1

Next mutation occurrence.

Compilation flags:

```
static
```

Template:

```
next_occurrence(Occurrence)
```

Mode and number of proofs:

```
next_occurrence(-integer) - one
```

Private predicates

current_predicate_clause_index_/2

Table of current clause indexes per predicate.

Compilation flags:

```
dynamic
```

Template:

```
current_predicate_clause_index_(Predicate,ClauseIndex)
```

Mode and number of proofs:

```
current_predicate_clause_index_(?predicate_indicator,?integer) - zero_or_one
```

---

update_target_predicate_clause_index_/2

Updates and returns the next clause index for the given predicate.

Compilation flags:
`static`

Template:
`update_target_predicate_clause_index_(Predicate,ClauseIndex)`
Mode and number of proofs:
`update_target_predicate_clause_index_(@predicate_indicator,-integer)` - `one`

---

current_scope_directive_index_/2

Table of current scope directive indexes per predicate.

Compilation flags:
`dynamic`

Template:
`current_scope_directive_index_(Predicate,DirectiveIndex)`
Mode and number of proofs:
`current_scope_directive_index_(?predicate_indicator,?integer)` - `zero_or_one`

Public predicates

reset/0

Resets any mutator internal state used while expanding terms.

Compilation flags:
`static`

Mode and number of proofs:
`reset` - `one`

---

mutation/2

Generates by backtracking zero or more mutations for a given term.

Compilation flags:
`static`

Template:
`mutation(Term,Mutation)`

Mode and number of proofs:
`mutation(@callable,@callable)` - `zero_or_more`

---

coverage_clause_mutator/0

True when mutation occurrences map directly to predicate clause numbers and can use baseline clause coverage for skipping uncovered mutants.

Compilation flags:
`static`

Mode and number of proofs:
`coverage_clause_mutator` - `zero_or_one`

n_grams/3

Generates overlapping n-grams from a list of text tokens.

Compilation flags:
`static`

Template:
`n_grams(N,Tokens,NGrams)`

Mode and number of proofs:
`n_grams(+positive_integer,+list(text),-list(list(text)))` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
`N` is a variable:
`instantiation_error`
`N` is neither a variable nor a positive integer:
`type_error(positive_integer,Options)`

`Tokens` is a partial list or a list with an element `Element` which is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but a ground element `Element` of the list `Tokens` is not an atom:
`type_error(atom,Element)`
The `Representation` parameter is `chars` but an element `Element` of the list `Tokens` is not a list of characters:
`type_error(chars,Element)`
The `Representation` parameter is `codes` but an element `Element` of the list `Tokens` is not a list of character codes:
`type_error(codes,Element)`

---

n_grams/4

Generates n-grams from a list of text tokens using the given options.

Compilation flags:
`static`

Template:
`n_grams(N,Tokens,NGrams,Options)`
Mode and number of proofs:
`n_grams(+positive_integer,+list(text),-list(list(text)),+list(compound))` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
`N` is a variable:
`instantiation_error`
`N` is neither a variable nor a positive integer:
`type_error(positive_integer,Options)`
`Tokens` is a partial list or a list with an element `Element` which is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but a ground element `Element` of the list `Tokens` is not an atom:
`type_error(atom,Element)`
The `Representation` parameter is `chars` but an element `Element` of the list `Tokens` is not a list of characters:
`type_error(chars,Element)`
The `Representation` parameter is `codes` but an element `Element` of the list `Tokens` is not a list of character codes:
`type_error(codes,Element)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

character_n_grams/3

Generates overlapping character n-grams from a text value.

Compilation flags:
`static`

Template:
`character_n_grams(N,Text,NGrams)`
Mode and number of proofs:
`character_n_grams(+positive_integer,+text,-list(text))` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
`N` is a variable:
`instantiation_error`
`N` is neither a variable nor a positive integer:
`type_error(positive_integer,Options)`
`Text` is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but `Text` is not an atom:
`type_error(atom,Text)`
The `Representation` parameter is `chars` but `Text` is not a list of characters:
`type_error(chars,Text)`
The `Representation` parameter is `codes` but `Text` is not a list of character codes:
`type_error(codes,Text)`

---

character_n_grams/4

Generates character n-grams from a text value using the given options.

Compilation flags:
`static`

Template:
`character_n_grams(N,Text,NGrams,Options)`
Mode and number of proofs:
`character_n_grams(+positive_integer,+text,-list(text),+list(compound))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

```
instantiation_error
```

The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:

```
domain_error(text_representation,Representation)
```

`N` is a variable:

```
instantiation_error
```

`N` is neither a variable nor a positive integer:

```
type_error(positive_integer,Options)
```

`Text` is not a ground term:

```
instantiation_error
```

The `Representation` parameter is `atom` but `Text` is not an atom:

```
type_error(atom,Text)
```

The `Representation` parameter is `chars` but `Text` is not a list of characters:

```
type_error(chars,Text)
```

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

```
type_error(codes,Text)
```

`Options` is a variable:

```
instantiation_error
```

`Options` is neither a variable nor a list:

```
type_error(list,Options)
```

An element `Option` of the list `Options` is a variable:

```
instantiation_error
```

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

---

count/2

Counts n-gram occurrences, preserving the order of first occurrence. Assumes `NGrams` is valid.

Compilation flags:

```
static
```

Template:

```
count(NGrams,Counts)
```

Mode and number of proofs:

```
count(+list(text),-list(pair(text,positive_integer))) - one
count(+list(list(text)),-list(pair(list(text),positive_integer))) - one
```

---

count/3

Counts n-gram occurrences using the requested ordering. Valid orderings are `first_occurrence`, `standard`, and `frequency_descending`. Assumes `NGrams` is valid.

Compilation flags:

`static`

Template:

`count(Order,NGrams,Counts)`

Mode and number of proofs:

`count(+atom,+list(text),-list(pair(text,positive_integer)))` - `one_or_error`

`count(+atom,+list(list(text)),-list(pair(list(text),positive_integer)))` - `one_or_error`

Exceptions:

`Order` is a variable:

`instantiation_error`

`Order` is neither a variable nor a valid ordering:

`domain_error(count_order,Order)`

---

bigrams/2

Generates overlapping bigrams from a list of text tokens.

Compilation flags:

`static`

Template:

`bigrams(Tokens,Bigrams)`

Mode and number of proofs:

`bigrams(+list(text),-list(list(text)))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

`Tokens` is a partial list or a list with an element `Element` which is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but a ground element `Element` of the list `Tokens` is not an atom:

`type_error(atom,Element)`

The `Representation` parameter is `chars` but an element `Element` of the list `Tokens` is not a list of characters:

`type_error(chars,Element)`

The `Representation` parameter is `codes` but an element `Element` of the list `Tokens` is not a list of character codes:

`type_error(codes,Element)`

`trigrams/2`

Generates overlapping trigrams from a list of text tokens.

Compilation flags:
`static`

Template:
`trigrams(Tokens,Trigrams)`

Mode and number of proofs:
`trigrams(+list(text),-list(list(text)))` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
`Tokens` is a partial list or a list with an element `Element` which is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but a ground element `Element` of the list `Tokens` is not an atom:
`type_error(atom,Element)`
The `Representation` parameter is `chars` but an element `Element` of the list `Tokens` is not a list of characters:
`type_error(chars,Element)`
The `Representation` parameter is `codes` but an element `Element` of the list `Tokens` is not a list of character codes:
`type_error(codes,Element)`

1.232 naive_bayes_classifier

object

1.232.1 `naive_bayes_classifier`

Naive Bayes classifier with Laplace smoothing and Gaussian distribution support. Learns from a dataset object implementing the `dataset_protocol` protocol and returns a classifier term that can be used for prediction and exported as predicate clauses.

Availability:
`logtalk_load(naive_bayes_classifier(loader))`

Author: Paulo Moura
Version: 2:0:1
Date: 2026-10-13

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *probabilistic_classifier_common*
Uses:
format
list
pairs
population
type

Remarks:
(none)

Public predicates

predict/4

Predicts the class label for a new instance using the learned classifier and the given options. The instance is a list of `Attribute-Value` pairs.

Compilation flags:

```
static
```

Template:

```
predict(Classifier,Instance,Class,Options)
```

Mode and number of proofs:

```
predict(+compound,+list,-atom,+list(compound)) - one
```

---

predict_probabilities/4

Predicts class probabilities for a new instance using the learned classifier and the given options. Returns a list of `Class-Probability` pairs. The instance is a list of `Attribute-Value` pairs.

Compilation flags:

```
static
```

Template:

```
predict_probabilities(Classifier,Instance,Probabilities,Options)
```

Mode and number of proofs:

```
predict_probabilities(+compound,+list,-list,+list(compound)) - one
```

      - *delete_in/4*
    - *Protected predicates*
    - *Private predicates*
    - *Operators*

Public predicates

new/1

Create an empty (nested) dictionary.

Compilation flags:
`static`

Template:
`new(Dictionary)`
Mode and number of proofs:
`new(--dictionary)` - `one`

---

empty/1

True iff the dictionary is empty.

Compilation flags:
`static`

Template:
`empty(Dictionary)`
Mode and number of proofs:
`empty(@dictionary)` - `zero_or_one`

---

as_nested_dictionary/2

Creates a (nested) dictionary term from a curly-brackted term representation.

Compilation flags:
`static`

Template:

```
as_nested_dictionary(Term,Dictionary)
```

Mode and number of proofs:

```
as_nested_dictionary(++term,--dictionary) - one_or_error
```

Exceptions:

`Term` is a variable:

```
instantiation_error
```

`Term` is neither a variable nor a valid curly-bracketed term representation:

```
type_error(curly_bracketed_term,Term)
```

`Dictionary` is instantiated:

```
uninstantiation_error(Dictionary)
```

---

as_curly_bracketed/2

Creates a a curly-brackted term representation from a (nested) dictionary.

Compilation flags:

```
static
```

Template:

```
as_curly_bracketed(Dictionary,Term)
```

Mode and number of proofs:

```
as_curly_bracketed(+dictionary,--term) - one_or_error
```

Exceptions:

`Dictionary` is a variable or contains a variable leaf value that cannot be represented:

```
instantiation_error
```

`Term` is instantiated:

```
uninstantiation_error(Term)
```

---

lookup_in/3

Lookup a chain of keys in a nested dictionary. Unifies `Value` with `Dictionary` when `Keys` is the empty list.

Compilation flags:

```
static
```

Template:

```
lookup_in(Keys,Value,Dictionary)
```

Mode and number of proofs:

```
lookup_in(++list(ground),?term,+dictionary) - zero_or_more
```

---

update_in/4

Updates the value found by traversing through the nested keys.

Compilation flags:

```
static
```

Template:

```
update_in(OldDictionary,Keys,Value,NewDictionary)
```

Mode and number of proofs:

```
update_in(+dictionary,++list(ground),++term,--dictionary) - zero_or_one
```

---

update_in/5

Updates the value found by traversing through the nested keys, only succeeding if the value found after traversal matches the old value.

Compilation flags:

```
static
```

Template:

```
update_in(OldDictionary,Keys,OldValue,NewValue,NewDictionary)
```

Mode and number of proofs:

```
update_in(+dictionary,++list(ground),?term,++term,--dictionary) - zero_or_one
```

---

insert_in/4

Inserts a key-value pair into a dictionary by traversing through the nested keys. When the key already exists, the associated value is updated.

Compilation flags:

```
static
```

Template:

```
insert_in(OldDictionary,Keys,Value,NewDictionary)
```

Mode and number of proofs:

```
insert_in(+dictionary,++list(ground),++term,--dictionary) - zero_or_one
```

---

delete_in/4

Deletes a matching key-value pair from a dictionary by traversing through the nested keys, returning the updated dictionary.

Compilation flags:
`static`

Template:
`delete_in(OldDictionary,Keys,Value,NewDictionary)`
Mode and number of proofs:
`delete_in(+dictionary,++list(ground),?term,--dictionary)` - `zero_or_one`

  - *talker/2*
  - *sentence_type/2*
  - *fields/2*
  - *checksum/2*
  - *data/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

parse/2

Parses NMEA sentences from a source specification into canonical raw sentence terms. Supported source specifications are `atom(Atom)`, `chars(List)`, `codes(List)`, `stream(Stream)`, and `file(Path)`.

Compilation flags:
`static`

Template:
`parse(Source,Sentences)`

Mode and number of proofs:
`parse(++compound,--list(compound))` - `one_or_error`

Exceptions:
`Source` is a variable or contains a variable source argument:
`instantiation_error`
`Source` is neither a variable nor a valid source specification:
`domain_error(nmea_source,Source)`
`Source` is a valid source specification but contains a line that cannot be parsed as a sentence:
`domain_error(nmea_sentence,Line)`

parse/3

Parses NMEA sentences from a source specification using parser options. Supported options are `checksum(required)`, `checksum(optional)`, `checksum(ignore)`, `unknown_type(keep)`, and `unknown_type(error)`.

Compilation flags:

`static`

Template:

`parse(Source,Sentences,Options)`

Mode and number of proofs:

`parse(++compound,--list(compound),++list(compound))` - `one_or_error`

Exceptions:

`Source` is a variable or contains a variable source argument:

`instantiation_error`

`Source` is neither a variable nor a valid source specification:

`domain_error(nmea_source,Source)`

`Source` is a valid source specification but contains a line that cannot be parsed as a sentence:

`domain_error(nmea_sentence,Line)`

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

---

talker/2

Returns the normalized talker identifier for a parsed sentence. Proprietary sentences use the atom `proprietary`.

Compilation flags:

`static`

Template:

`talker(Sentence,Talker)`

Mode and number of proofs:

`talker(+compound,-atom)` - `one`

---

sentence_type/2

Returns the normalized sentence type identifier for a parsed sentence.

Compilation flags:
`static`

Template:
`sentence_type(Sentence,Type)`
Mode and number of proofs:
`sentence_type(+compound,-atom)` - `one`

---

fields/2

Returns the lossless ordered list of sentence fields after the sentence identifier.

Compilation flags:
`static`

Template:
`fields(Sentence,Fields)`
Mode and number of proofs:
`fields(+compound,-list(atom))` - `one`

---

checksum/2

Returns the checksum information as `checksum(Provided,Computed)` where `Provided` is either a normalized two-digit hexadecimal atom or `missing`.

Compilation flags:
`static`

Template:
`checksum(Sentence,Checksum)`
Mode and number of proofs:
`checksum(+compound,-compound)` - `one`

---

data/2

Projects a parsed sentence into a typed semantic term for the supported sentence types `gga`, `rmc`, `gsa`, `gsv`, `vtg`, and `gll`.

Compilation flags:
`static`

Template:
`data(Sentence,Data)`
Mode and number of proofs:
`data(+compound,-compound)` - `zero_or_one`

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

prepare_points/3

Validates and sorts interpolation points and returns separate abscissa and ordinate lists.

Compilation flags:
`static`

Template:
`prepare_points(Points,Abscissas,Ordinates)`
Mode and number of proofs:
`prepare_points(+list(pair),-list(number),-list(number))` - `one_or_error`

Exceptions:
`Points` is a variable:
`instantiation_error`
`Points` is not a valid list of at least two numeric points:
`domain_error(interpolation_points,Points)`
`Points` contains a duplicate abscissa:
`domain_error(duplicate_abscissa,Abscissa)`

---

check_argument/3

Checks that an interpolation argument lies in the closed fitted domain.

Compilation flags:
`static`

Template:
`check_argument(Argument,Lower,Upper)`
Mode and number of proofs:
`check_argument(+number,+number,+number)` - `one_or_error`

Exceptions:
`Argument` is a variable:
`instantiation_error`

`Argument` is not a number:
`type_error(number,Argument)`
`Argument` lies outside the fitted domain:
`domain_error(interpolation_domain,Argument)`

`select_interval/3`

Selects the fitted interval containing an already validated argument.

Compilation flags:
`static`

Template:
`select_interval(Argument,Intervals,Interval)`
Mode and number of proofs:
`select_interval(+number,+list(compound),-compound)` - `one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.238.9 `interpolator_protocol`

Public predicates

fit/2

Fits an interpolant to a list of `X-Y` points using default options.

Compilation flags:
`static`

Template:
`fit(Points,Model)`
Mode and number of proofs:
`fit(+list(pair),-compound)` - `one_or_error`

Exceptions:
`Points` is a variable:
`instantiation_error`
`Points` is not a valid list of at least two numeric points with distinct abscissas:
`domain_error(interpolation_points,Points)`

---

fit/3

Fits an interpolant to a list of `X-Y` points using the given options.

Compilation flags:
`static`

Template:
`fit(Points,Model,Options)`
Mode and number of proofs:
`fit(+list(pair),-compound,+list(compound))` - `one_or_error`

Exceptions:
`Points` or `Options` is a variable:

`instantiation_error`

`Points` is not a valid list of at least two numeric points with distinct abscissas:

`domain_error(interpolation_points,Points)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

---

evaluate/3

Evaluates a fitted interpolant inside its data domain.

Compilation flags:

`static`

Template:

`evaluate(Model,Argument,Value)`

Mode and number of proofs:

`evaluate(+compound,+number,-number)` - `one_or_error`

Exceptions:

`Model` is a variable:

`instantiation_error`

`Model` is not a model for the receiving interpolator:

`domain_error(interpolation_model,Model)`

`Argument` is a variable:

`instantiation_error`

`Argument` is not a number:

`type_error(number,Argument)`

`Argument` lies outside the fitted domain:

`domain_error(interpolation_domain,Argument)`

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

check_initial_value/3

Checks initial and final times and a non-empty numeric initial state.

Compilation flags:
`static`

Template:
`check_initial_value(InitialTime,InitialState,FinalTime)`
Mode and number of proofs:
`check_initial_value(+number,+list(number),+number) - one_or_error`

Exceptions:
An argument is a variable:
`instantiation_error`
A time is not a number:
`type_error(number,Time)`
`InitialState` is not a non-empty numeric list:
`domain_error(ode_state,InitialState)`

---

evaluate_derivative/3

Evaluates and validates a system derivative.

Compilation flags:
`static`

Template:
`evaluate_derivative(Time,State,Derivative)`
Mode and number of proofs:
`evaluate_derivative(+number,+list(number),-list(number)) - one_or_error`

Exceptions:

The system returns a non-numeric derivative or one with the wrong dimension:

```
domain_error(ode_derivative,Derivative)
```

solve/4

Solves an initial-value problem using default options.

Compilation flags:
`static`

Template:
`solve(InitialTime,InitialState,FinalTime,Trajectory)`
Mode and number of proofs:
`solve(+number,+list(number),+number,-list(pair))` - `one_or_error`

Exceptions:
An input argument is a variable:
`instantiation_error`
A time is not a number:
`type_error(number,Time)`
`InitialState` is not a non-empty numeric list:
`domain_error(ode_state,InitialState)`
The system returns an invalid derivative:
`domain_error(ode_derivative,Derivative)`

---

solve/5

Solves an initial-value problem using the given options.

Compilation flags:
`static`

Template:
`solve(InitialTime,InitialState,FinalTime,Trajectory,Options)`
Mode and number of proofs:
`solve(+number,+list(number),+number,-list(pair),+list(compound))` - `one_or_error`

Exceptions:
An input argument or `Options` is a variable:
`instantiation_error`
A time is not a number:
`type_error(number,Time)`
`InitialState` is not a non-empty numeric list:
`domain_error(ode_state,InitialState)`
The system returns an invalid derivative:
`domain_error(ode_derivative,Derivative)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:

`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

`solve/6`

Solves an initial-value problem and returns run statistics using the given options.

Compilation flags:
`static`

Template:
`solve(InitialTime,InitialState,FinalTime,Trajectory,Statistics,Options)`
Mode and number of proofs:
`solve(+number,+list(number),+number,-list(pair),-list(compound),+list(compound))` - `one_or_error`

Exceptions:
An input argument or `Options` is a variable:
`instantiation_error`
A time is not a number:
`type_error(number,Time)`
`InitialState` is not a non-empty numeric list:
`domain_error(ode_state,InitialState)`

An integration bound is not a number:
`type_error(number,Bound)`
The function returns a non-numeric value:
`domain_error(function_value,Value)`

---

integrate/4

Integrates the function over the given finite interval using the given options.

Compilation flags:
`static`

Template:
`integrate(Lower,Upper,Integral,Options)`
Mode and number of proofs:
`integrate(+number,+number,-number,+list(compound))` - `one_or_error`

Exceptions:

An integration bound or `Options` is a variable:
`instantiation_error`
An integration bound is not a number:
`type_error(number,Bound)`
`Options` is not a list or contains an invalid option:
`domain_error(options,Options)`
The function returns a non-numeric value:
`domain_error(function_value,Value)`

`integrate/5`

Integrates the function and returns run statistics using the given options.

Compilation flags:
`static`

Template:
`integrate(Lower,Upper,Integral,Statistics,Options)`
Mode and number of proofs:
`integrate(+number,+number,-number,-list(compound),+list(compound))` - `one_or_error`

Exceptions:
An integration bound or `Options` is a variable:
`instantiation_error`
An integration bound is not a number:
`type_error(number,Bound)`
`Options` is not a list or contains an invalid option:
`domain_error(options,Options)`
The function returns a non-numeric value:
`domain_error(function_value,Value)`

Protected predicates

(none)

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

evaluate_function/2

Evaluates the function and checks that it returns a number.

Compilation flags:
`static`

Template:
`evaluate_function(Argument,Value)`
Mode and number of proofs:
`evaluate_function(+number,-number)` - `one_or_error`

Exceptions:
The function returns a non-numeric value:
`domain_error(function_value,Value)`

---

check_bracket/3

Checks and unpacks a root bracket.

Compilation flags:
`static`

Template:
`check_bracket(Bracket,Lower,Upper)`
Mode and number of proofs:
`check_bracket(+compound,-number,-number)` - `one_or_error`

Exceptions:
`Bracket` is a variable:
`instantiation_error`
`Bracket` is not a valid increasing numeric bracket:
`domain_error(root_bracket,Bracket)`

Private predicates

(no local declarations; see entity ancestors if any)

Public predicates

find_root/2

Finds a root using default options.

Compilation flags:
`static`

Template:
`find_root(Initial,Root)`
Mode and number of proofs:
`find_root(+compound,-number)` - `one_or_error`

Exceptions:
`Initial` is a variable:
`instantiation_error`
`Initial` is not valid for the root finder:
`domain_error(root_initialization,Initial)`
The function returns a non-numeric value:
`domain_error(function_value,Value)`

---

find_root/3

Finds a root using the given options.

Compilation flags:
`static`

Template:
`find_root(Initial,Root,Options)`
Mode and number of proofs:
`find_root(+compound,-number,+list(compound))` - `one_or_error`

Exceptions:
`Initial` or `Options` is a variable:
`instantiation_error`
`Initial` is not valid for the root finder:
`domain_error(root_initialization,Initial)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`
The function returns a non-numeric value:
`domain_error(function_value,Value)`

`find_root/4`

Finds a root and returns run statistics using the given options.

Compilation flags:
`static`

Template:
`find_root(Initial,Root,Statistics,Options)`
Mode and number of proofs:
`find_root(+compound,-number,-list(compound),+list(compound))` - `one_or_error`

Exceptions:
`Initial` or `Options` is a variable:
`instantiation_error`
`Initial` is not valid for the root finder:
`domain_error(root_initialization,Initial)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The function returns a non-numeric value:
`domain_error(function_value,Value)`

Public predicates

solve/2

Solves an OMT source with default options and returns one result per check.

Compilation flags:
```
static
```

Template:
```
solve(Source,Results)
```
Mode and number of proofs:
```
solve(+compound,-list(compound)) - one_or_error
```

---

solve/3

Solves with solver/1, executable/1, and time_limit/1 options. OptiMathSAT rejects nonzero time limits.

Compilation flags:
```
static
```

Template:
```
solve(Source,Results,Options)
```
Mode and number of proofs:
```
solve(+compound,-list(compound),+list(compound)) - one_or_error
```

Exceptions:

An OptiMathSAT time limit is nonzero:
```
domain_error(optimathsat_time_limit,Seconds)
```
Solver output or process status is invalid:
```
omt_solver_error(Formal,Status,Diagnostics,SourceMap)
```

---

program/1

Generates and prints a source without invoking a solver.

Compilation flags:
```
static
```

Template:
```
program(Source)
```
Mode and number of proofs:
```
program(+compound) - one_or_error
```

---

program/2

Generates source character codes without invoking a solver.

Compilation flags:
```
static
```

Template:
```
program(Source,Codes)
```
Mode and number of proofs:
```
program(+compound,-list(integer)) - one_or_error
```

---

print_program/1

Prints source character codes.

Compilation flags:
```
static
```

Template:
```
print_program(Codes)
```
Mode and number of proofs:
```
print_program(+list(integer)) - one_or_error
```

---

status/2

Returns the status of a result.

Compilation flags:
`static`

Template:
`status(Result,Status)`
Mode and number of proofs:
`status(+compound,-atom)` - `one_or_error`

---

model_binding/2

Enumerates model bindings.

Compilation flags:
`static`

Template:
`model_binding(Result,Binding)`
Mode and number of proofs:
`model_binding(+compound,-pair)` - `zero_or_more`

---

model_value/3

Returns a named model value.

Compilation flags:
`static`

Template:
`model_value(Result,Name,Value)`
Mode and number of proofs:
`model_value(+compound,+atom,-term)` - `zero_or_one`

---

unsat_core_name/2

Enumerates unsatisfiable core names.

Compilation flags:
```
static
```

Template:
```
unsat_core_name(Result,Name)
```
Mode and number of proofs:
```
unsat_core_name(+compound,-atom) - zero_or_more
```

---

result_property/2

Enumerates result properties.

Compilation flags:
```
static
```

Template:
```
result_property(Result,Property)
```
Mode and number of proofs:
```
result_property(+compound,?compound) - zero_or_more
```

---

print_result/1

Prints a result and its objectives.

Compilation flags:
```
static
```

Template:
```
print_result(Result)
```
Mode and number of proofs:
```
print_result(+compound) - one_or_error
```

---

print_results/1

Prints a list of results.

Compilation flags:
`static`

Template:
`print_results(Results)`
Mode and number of proofs:
`print_results(+list(compound))` - `one_or_error`

---

capability/2

Enumerates advisory solver capabilities.

Compilation flags:
`static`

Template:
`capability(Solver,Feature)`
Mode and number of proofs:
`capability(?atom,?atom)` - `zero_or_more`

---

objective/3

Enumerates objective expressions and exact solver-reported bounds from a get-objectives response.

Compilation flags:
`static`

Template:
`objective(Result,Expression,Bound)`
Mode and number of proofs:
`objective(+compound,-term,-term)` - `zero_or_more`

Protected predicates

(none)

Private predicates

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *handle_open_ai/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

handle_open_ai/3

Handles an OpenAI operation selected by operation identifier for the normalized HTTP request and returns a REST result term accepted by the `rest` library. The predicate is expected to succeed once for both successful and application error outcomes; plain failure or error is a backend contract violation handled by the server facade as an unexpected server error.

Compilation flags:
```
static
```

Template:
```
handle_open_ai(OperationId,Request,Result)
```
Mode and number of proofs:
```
handle_open_ai(+atom,+compound,--term) - one
```

Protected predicates

(none)

1.241.4 open_ai_catalog

Generated catalog for the public non-admin OpenAI API endpoint surface.

Availability:
```
logtalk_load(open_ai(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-09

Compilation flags:
```
static, context_switching_calls
```

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:

(none)

- *Public predicates*
  - *spec_version/1*
  - *operation_count/1*
  - *operation/8*
  - *operation_properties/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

spec_version/1

Returns the pinned OpenAI OpenAPI document version used to generate the catalog.

Compilation flags:
```
static
```

Template:
```
spec_version(Version)
```
Mode and number of proofs:
```
spec_version(-atom) - one
```

---

operation_count/1

Returns the number of public non-admin OpenAI operations in the generated catalog.

Compilation flags:
```
static
```

Template:
```
operation_count(Count)
```
Mode and number of proofs:
```
operation_count(-integer) - one
```

---

operation/8

Enumerates generated OpenAI operation descriptors.

Compilation flags:
`static`

Template:
`operation(Id,Tag,Method,Path,Summary,Parameters,RequestBody,Responses)`
Mode and number of proofs:
`operation(?atom,?atom,?atom,?atom,?atom,?list(compound),?compound,?list(compound))` - `zero_or_more`

---

operation_properties/2

Enumerates additional generated OpenAPI properties for an operation.

Compilation flags:
`static`

Template:
`operation_properties(Id,Properties)`
Mode and number of proofs:
`operation_properties(?atom,?list(compound))` - `zero_or_more`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
object

1.241.5 open_ai_client

OpenAI-compatible client facade using the `http_client` library.

Availability:
`logtalk_load(open_ai(loader))`

Author: Paulo Moura

Version: 1:0:0
Date: 2026-07-09

Compilation flags:
`static, context_switching_calls`

Uses:
http_client
list
open_ai_catalog

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *request/5*
  - *operation_url/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

request/5

Calls an OpenAI operation by operation identifier. Path parameters are supplied as `Name-Value` pairs. The body is ignored for methods without a request body. Options include `base_url/1`, `api_key/1`, `organization/1`, `project/1`, and ordinary `http_client` request options.

Compilation flags:
`static`

Template:
`request(OperationId,PathParameters,Body,Response,Options)`
Mode and number of proofs:
`request(+atom,+list(pair),+compound,--compound,+list(compound))` - `one_or_error`

Exceptions:
The catalog operation method `Method` is unsupported by the client facade:
`domain_error(open_ai_operation_method,Method)`
An element `Parameter` of the list `PathParameters` is not a `Name-Value` pair of atoms:
`domain_error(open_ai_path_parameter,Parameter)`
`Options` contains an invalid OpenAI client option:
`domain_error(open_ai_client_option,Option)`
The delegated HTTP client rejects the response stream:

`domain_error(http_response_stream,Error)`

`operation_url/4`

Builds the absolute request URL for an operation and path parameters.

Compilation flags:
`static`

Template:
`operation_url(OperationId,PathParameters,URL,Options)`
Mode and number of proofs:
`operation_url(+atom,+list(pair),-atom,+list(compound))` - `one_or_error`

Exceptions:
An element `Parameter` of the list `PathParameters` is not a `Name-Value` pair of atoms:
`domain_error(open_ai_path_parameter,Parameter)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.241.6 `open_ai_event_stream`

Small Server-Sent Events helpers used by OpenAI streaming endpoints.

Availability:
`logtalk_load(open_ai(loader))`

Author: Paulo Moura
Version: 1:0:0

- *Operators*

Public predicates

event/2

Parses a single OpenAI event-stream frame atom into `event(Name, Data)`. Unknown fields are ignored.

Compilation flags:
`static`

Template:
`event(Frame,Event)`
Mode and number of proofs:
`event(+atom,-compound)` - `one_or_error`

Exceptions:
`Frame` is not an event-stream frame atom:
`domain_error(open_ai_event_stream_frame,Frame)`

---

frame/2

Generates an event-stream frame atom from `event(Name, Data)`.

Compilation flags:
`static`

Template:
`frame(Event,Frame)`
Mode and number of proofs:
`frame(+compound,-atom)` - `one_or_error`

Exceptions:

`Event` is not an event-stream event term:
`domain_error(open_ai_event_stream_event,Event)`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
object

1.241.7 `open_ai_server(Backend)`

- `Backend` - Application object implementing `open_ai_backend_protocol`.

OpenAI-compatible REST server facade backed by an application object.

Availability:
`logtalk_load(open_ai(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-13

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *http_handler_protocol*
`public` *open_api_provider_protocol*
Imports:
`public` *rest*
Uses:
http_core
list
open_ai_api
open_ai_catalog

Remarks:
(none)

Inherited public predicates:

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

open_api_info/1

Hook returning the OpenAPI information object for the server facade.

Compilation flags:
`static`

Template:
`open_api_info(Info)`
Mode and number of proofs:
`open_api_info(-compound)` - `one`

---

open_api_servers/1

Hook returning the OpenAPI server list for the local server facade.

Compilation flags:
`static`

Template:
`open_api_servers(Servers)`
Mode and number of proofs:
`open_api_servers(-list(compound))` - `one`

---

open_api_security/1

Hook returning the OpenAPI security requirements for the server facade.

Compilation flags:
`static`

Template:
`open_api_security(Security)`
Mode and number of proofs:
`open_api_security(-list(compound))` - `zero_or_one`

---

open_api_security_scheme/2

Hook enumerating OpenAPI security schemes for the server facade.

Compilation flags:
`static`

Template:
`open_api_security_scheme(Name,Scheme)`
Mode and number of proofs:
`open_api_security_scheme(?atom,?compound)` - `zero_or_more`

---

open_api_schema/2

Hook enumerating named OpenAPI schemas for the server facade.

Compilation flags:
`static`

Template:
`open_api_schema(Name,Schema)`
Mode and number of proofs:
`open_api_schema(?atom,?compound)` - `zero_or_more`

---

endpoint/5

Hook enumerating REST endpoint descriptors derived from the generated OpenAI catalog.

Compilation flags:
```
static
```

Template:
```
endpoint(Id,Method,Path,Action,Options)
```
Mode and number of proofs:
```
endpoint(?atom,?atom,?atom,?atom,?list(compound)) - zero_or_more
```

---

open_api_validate_request/1

Hook selecting operations whose requests should be validated against the OpenAPI contract.

Compilation flags:
```
static
```

Template:
```
open_api_validate_request(Id)
```
Mode and number of proofs:
```
open_api_validate_request(?atom) - zero_or_more
```

---

open_api_validate_response/1

Hook selecting operations whose responses should be validated against the OpenAPI contract.

Compilation flags:
```
static
```

Template:
```
open_api_validate_response(Id)
```
Mode and number of proofs:
```
open_api_validate_response(?atom) - zero_or_more
```

---

dispatch_open_ai/2

Dispatches a routed OpenAI request to the backend object and returns a REST result. Backend application errors should be returned as REST result terms; unexpected backend failure or error is left to the `rest` action failure handling.

Compilation flags:
`static`

Template:
`dispatch_open_ai(Request,Result)`
Mode and number of proofs:
`dispatch_open_ai(+compound,--term)` - `one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

1.242 open_api

object

1.242.1 open_api

OpenAPI 3.1.0 document derivation, parsing, generation, and validation built on top of the `json` and `json_schema` libraries.

Availability:
`logtalk_load(open_api(loader))`

Author: Paulo Moura
Version: 1:1:1
Date: 2026-10-07

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *http_json_term_helpers*
Uses:
http_core
json
json_schema
list
url(Representation)

Remarks:
(none)

Inherited public predicates:
(none)

  - *problem_json_schema/1*
  - *problem_response_descriptor/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

document/2

Derives an OpenAPI 3.1.0 document in the repository-standard JSON term representation from an object implementing the `open_api_provider_protocol` protocol. When the provider also implements the `application_protocol` protocol, missing `description` and `license` info fields may be backfilled from application metadata and `homepage/1` may be mapped to the top-level `externalDocs` object. Top-level security defaults declared by `security/1` are emitted under the root `security` field. Reusable security schemes declared by `security_scheme/2` are emitted under `components.securitySchemes` and referenced scheme names and OAuth flow scopes are validated against those declarations when locally available.

Compilation flags:
`static`

Template:
`document(Provider,Document)`
Mode and number of proofs:
`document(+object_identifier,-compound)` - `one`

---

parse/2

Parses an OpenAPI document from the given source (`file(Path)`, `stream(Stream)`, `codes(List)`, `chars(List)`, or `atom(Atom)`) into the JSON term representation used by the `json` library.

Compilation flags:
`static`

Template:
`parse(Source,Document)`
Mode and number of proofs:
`parse(++compound,--term)` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid JSON source term or does not contain parsable JSON by the implementation:
`domain_error(json_source,Source)`

---

generate/2

Generates the representation specified in the first argument (`file(Path)`, `stream(Stream)`, `codes(List)`, `chars(List)`, or `atom(Atom)`) for an OpenAPI document term using JSON serialization.

Compilation flags:
`static`

Template:
`generate(Sink,Document)`
Mode and number of proofs:
`generate(+compound,++term)` - `one_or_error`

Exceptions:
`Sink` is a variable:
`instantiation_error`
`Sink` is neither a variable nor a valid JSON sink term:
`domain_error(json_sink,Sink)`
A JSON version of `Document` cannot be generated by the implementation:
`domain_error(json_sink,Document)`

---

validate_document/1

Succeeds if the given OpenAPI document term is valid according to the phase-1 OpenAPI validation schema.

Compilation flags:
`static`

Template:
`validate_document(Document)`
Mode and number of proofs:
`validate_document(+term)` - `zero_or_one`

---

validate_document/2

Validates an OpenAPI document term and returns a list of validation errors (empty list if valid).

Compilation flags:
`static`

Template:
`validate_document(Document,Errors)`
Mode and number of proofs:
`validate_document(+term,--list)` - `one`

---

operation/3

Resolves an operation descriptor exposed by a provider object using its `operationId` atom.

Compilation flags:
`static`

Template:
`operation(Provider,OperationId,Operation)`
Mode and number of proofs:
`operation(+object_identifier,+atom,-compound)` - `one_or_error`

Exceptions:
`Provider` does not expose the requested `operationId`:
`existence_error(open_api_operation,OperationId)`
`Provider` exposes duplicated `operationId` values:
`domain_error(open_api_operation_id,duplicate(Id))`

---

validate_request/3

Succeeds when the given normalized HTTP request term or object implementing the `http_request_protocol` protocol conforms to the provider operation descriptor identified by the given `operationId`.

Compilation flags:
`static`

Template:
`validate_request(Provider,OperationId,Request)`
Mode and number of proofs:
`validate_request(+object_identifier,+atom,++term)` - `zero_or_one`

---

validate_request/4

Validates a normalized HTTP request term or an object implementing the `http_request_protocol` protocol against the provider operation descriptor identified by the given `operationId` and returns any contract errors.

Compilation flags:
`static`

Template:
`validate_request(Provider,OperationId,Request,Errors)`
Mode and number of proofs:
`validate_request(+object_identifier,+atom,++term,--list)` - `one`

---

validate_http_request/3

Succeeds when an HTTP request wire source parsed by the `http_core` library conforms to the provider operation descriptor identified by the given `operationId`.

Compilation flags:
`static`

Template:
`validate_http_request(Provider,OperationId,Source)`
Mode and number of proofs:
`validate_http_request(+object_identifier,+atom,++compound)` - `zero_or_one`

---

validate_http_request/4

Parses an HTTP request wire source using the `http_core` library and validates the resulting normalized request against the provider operation descriptor identified by the given `operationId`.

Compilation flags:
`static`

Template:
`validate_http_request(Provider,OperationId,Source,Errors)`
Mode and number of proofs:
`validate_http_request(+object_identifier,+atom,++compound,--list)` - `one`

---

validate_response/3

Succeeds when the given normalized HTTP response term or object implementing the `http_response_protocol` protocol conforms to the provider operation descriptor identified by the given `operationId`.

Compilation flags:
`static`

Template:
`validate_response(Provider,OperationId,Response)`
Mode and number of proofs:
`validate_response(+object_identifier,+atom,++term)` - `zero_or_one`

---

validate_response/4

Validates a normalized HTTP response term or an object implementing the `http_response_protocol` protocol against the provider operation descriptor identified by the given `operationId` and returns any contract errors.

Compilation flags:
`static`

Template:
`validate_response(Provider,OperationId,Response,Errors)`
Mode and number of proofs:
`validate_response(+object_identifier,+atom,++term,--list)` - `one`

---

validate_http_response/3

Succeeds when an HTTP response wire source parsed by the `http_core` library conforms to the provider operation descriptor identified by the given `operationId`.

Compilation flags:
`static`

Template:
`validate_http_response(Provider,OperationId,Source)`
Mode and number of proofs:
`validate_http_response(+object_identifier,+atom,++compound)` - `zero_or_one`

---

validate_http_response/4

Parses an HTTP response wire source using the `http_core` library and validates the resulting normalized response against the provider operation descriptor identified by the given `operationId`.

Compilation flags:
`static`

Template:
`validate_http_response(Provider,OperationId,Source,Errors)`
Mode and number of proofs:
`validate_http_response(+object_identifier,+atom,++compound,--list)` - `one`

---

json_media_descriptor/2

Constructs an OpenAPI JSON media descriptor using the default `application/json` media type.

Compilation flags:
`static`

Template:
`json_media_descriptor(Schema,MediaDescriptor)`
Mode and number of proofs:
`json_media_descriptor(++term,-compound)` - `one_or_error`

Exceptions:
`Schema` is a variable:
`instantiation_error`
`Schema` is neither a boolean schema nor a JSON object schema term nor a `schema_ref/1` term:
`domain_error(open_api_json_schema_term,Schema)`

---

json_media_descriptor/3

Constructs an OpenAPI JSON media descriptor using the given media type.

Compilation flags:
`static`

Template:
`json_media_descriptor(MediaType,Schema,MediaDescriptor)`
Mode and number of proofs:
`json_media_descriptor(+atom,++term,-compound)` - `one_or_error`

Exceptions:
`MediaType` is a variable:
`instantiation_error`
`MediaType` is neither a variable nor a JSON-compatible HTTP media type atom:
`domain_error(open_api_media_type,MediaType)`
`Schema` is a variable:
`instantiation_error`
`Schema` is neither a boolean schema nor a JSON object schema term nor a `schema_ref/1` term:
`domain_error(open_api_json_schema_term,Schema)`

---

json_request_body_descriptor/4

Constructs an OpenAPI request-body descriptor using the default `application/json` media type.

Compilation flags:
`static`

Template:
`json_request_body_descriptor(Description,Required,Schema,RequestBody)`
Mode and number of proofs:
`json_request_body_descriptor(+atom,+boolean,++term,-compound)` - `one_or_error`

Exceptions:
`Description` is a variable:
`instantiation_error`
`Description` is neither a variable nor an atom:
`domain_error(open_api_description,Description)`
`Required` is a variable:
`instantiation_error`
`Required` is neither a variable nor a boolean:
`domain_error(open_api_boolean,Required)`
`Schema` is a variable:
`instantiation_error`
`Schema` is neither a boolean schema nor a JSON object schema term nor a `schema_ref/1` term:
`domain_error(open_api_json_schema_term,Schema)`

json_request_body_descriptor/5

Constructs an OpenAPI request-body descriptor using the given media type.

Compilation flags:
`static`

Template:
`json_request_body_descriptor(MediaType,Description,Required,Schema,RequestBody)`
Mode and number of proofs:
`json_request_body_descriptor(+atom,+atom,+boolean,++term,-compound)` - `one_or_error`

Exceptions:
`MediaType` is a variable:
`instantiation_error`
`MediaType` is neither a variable nor a JSON-compatible HTTP media type atom:
`domain_error(open_api_media_type,MediaType)`
`Description` is a variable:
`instantiation_error`
`Description` is neither a variable nor an atom:
`domain_error(open_api_description,Description)`
`Required` is a variable:
`instantiation_error`
`Required` is neither a variable nor a boolean:
`domain_error(open_api_boolean,Required)`
`Schema` is a variable:
`instantiation_error`
`Schema` is neither a boolean schema nor a JSON object schema term nor a `schema_ref/1` term:
`domain_error(open_api_json_schema_term,Schema)`

---

json_response_descriptor/4

Constructs an OpenAPI response descriptor using the default `application/json` media type.

Compilation flags:
`static`

Template:
`json_response_descriptor(Status,Description,Schema,ResponseDescriptor)`
Mode and number of proofs:
`json_response_descriptor(++term,+atom,++term,-compound)` - `one_or_error`

Exceptions:
`Status` is a variable:
`instantiation_error`

`Status` is neither a variable nor `default` nor an integer in the `100..599` range nor a wildcard status atom such as `'2XX'`:
`domain_error(open_api_response_status,Status)`
`Description` is a variable:
`instantiation_error`
`Description` is neither a variable nor an atom:
`domain_error(open_api_description,Description)`
`Schema` is a variable:
`instantiation_error`
`Schema` is neither a boolean schema nor a JSON object schema term nor a `schema_ref/1` term:
`domain_error(open_api_json_schema_term,Schema)`

`json_response_descriptor/5`

Constructs an OpenAPI response descriptor using the given media type.

Compilation flags:
`static`

Template:
`json_response_descriptor(Status,Description,MediaType,Schema,ResponseDescriptor)`
Mode and number of proofs:
`json_response_descriptor(++term,+atom,+atom,++term,-compound)` - `one_or_error`

Exceptions:
`Status` is a variable:
`instantiation_error`
`Status` is neither a variable nor `default` nor an integer in the `100..599` range nor a wildcard status atom such as `'2XX'`:
`domain_error(open_api_response_status,Status)`
`Description` is a variable:
`instantiation_error`
`Description` is neither a variable nor an atom:
`domain_error(open_api_description,Description)`
`MediaType` is a variable:
`instantiation_error`
`MediaType` is neither a variable nor a JSON-compatible HTTP media type atom:
`domain_error(open_api_media_type,MediaType)`
`Schema` is a variable:
`instantiation_error`
`Schema` is neither a boolean schema nor a JSON object schema term nor a `schema_ref/1` term:
`domain_error(open_api_json_schema_term,Schema)`

---

problem_json_schema/1

Returns an inline RFC 7807-compatible JSON schema for problem responses.

Compilation flags:
`static`

Template:
`problem_json_schema(Schema)`
Mode and number of proofs:
`problem_json_schema(-term)` - `one`

---

problem_response_descriptor/3

Constructs an OpenAPI problem-response descriptor using the `application/problem+json` media type and the default problem schema.

Compilation flags:
`static`

Template:
`problem_response_descriptor(Status,Description,ResponseDescriptor)`
Mode and number of proofs:
`problem_response_descriptor(++term,+atom,-compound)` - `one_or_error`

Exceptions:
`Status` is a variable:
`instantiation_error`
`Status` is neither a variable nor `default` nor an integer in the `100..599` range nor a wildcard status atom such as `'2XX'`:
`domain_error(open_api_response_status,Status)`
`Description` is a variable:
`instantiation_error`
`Description` is neither a variable nor an atom:
`domain_error(open_api_description,Description)`

Protected predicates

json, *json_schema*, *application_protocol*, *open_api_provider_protocol*

protocol

1.242.2 `open_api_provider_protocol`

Protocol for Logtalk objects that provide metadata used to derive OpenAPI 3.1.0 documents.

Availability:
`logtalk_load(open_api(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-06-08

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *api_info/1*
  - *servers/1*
  - *security/1*
  - *operations/1*
  - *schema/2*
  - *security_scheme/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

api_info/1

Returns the API metadata descriptor. The descriptor must be the compound term `info(Title, Version, Summary, Properties)` where `Title`, `Version`, and `Summary` are atoms and `Properties` is a list of optional metadata terms. Currently recognized properties: `description(Description)` where `Description` is an atom.

Compilation flags:
`static`

Template:
`api_info(Info)`
Mode and number of proofs:
`api_info(-compound)` - `one`

---

servers/1

Returns a list of server descriptors available for this API. Each descriptor must be a compound term `server(URL, Description)` where `URL` is a valid OpenAPI Server Object URL atom, allowing absolute URLs, relative references, and templated variables, and `Description` is a human-readable atom.

Compilation flags:
`static`

Template:
`servers(Servers)`
Mode and number of proofs:
`servers(-list(compound))` - `one`

---

security/1

Returns the top-level OpenAPI security requirement alternatives for this API. The returned list uses the same representation as operation `security(Requirements)` properties: each element is a requirement alternative represented as a list of `Scheme-Scopes` pairs and `[]` denotes an empty security requirement object. Scheme names must be declared by `security_scheme/2`.

Compilation flags:
`static`

Template:
`security(Security)`
Mode and number of proofs:
`security(-list(compound))` - `zero_or_one`

---

operations/1

Returns a list of operation descriptors exposed by this API. Each descriptor must be a compound term `operation(Id, Method, Path, Summary, Parameters, RequestBody, Responses, Properties)` where `Id` is an atom and unique across the returned descriptors, `Method` is a lowercase HTTP method atom, `Path` is a path-template atom, `Summary` is an atom, `Parameters` is a list of `parameter(Name, In, Description, Required, Schema)` terms, `RequestBody` is either `none` or `request_body(Description, Required, MediaTypes)`, `Responses` is a list of `response(Status, Description, MediaTypes)` terms, and `Properties` is a list of optional operation property terms. `Status` may be an integer HTTP status code, `default`, or a wildcard range atom such as `'2XX'`. Path parameters must use `In = path`, match a template expression in `Path`, and use `Required = true`. Currently recognized property terms are `description(Description)`, `tags(Tags)`, `deprecated(Boolean)`, and `security(Requirements)` where `Requirements` is a list whose elements are requirement alternatives represented as lists of `Scheme-Scopes` pairs; the empty list element `[]` denotes an empty security requirement object, scheme names must be declared by `security_scheme/2`, and referenced OAuth flow scopes must be declared by the corresponding security scheme when locally available.

Compilation flags:

`static`

Template:

`operations(Operations)`

Mode and number of proofs:

`operations(-list(compound))` - `one`

---

schema/2

Maps reusable schema names to JSON Schema terms. `Name` must be an atom and `Schema` must be a JSON Schema curly term compatible with the `json_schema` library. This predicate is intended both for lookup by name and for enumeration of all reusable schemas referenced from `schema_ref(Name)` terms.

Compilation flags:

`static`

Template:

`schema(Name,Schema)`

Mode and number of proofs:

`schema(?atom,?compound)` - `zero_or_more`

---

security_scheme/2

Maps reusable security scheme names to security descriptor terms. `Name` must be an atom matching scheme names referenced from operation `security(Requirements)` properties and `Scheme` must use one of the supported descriptor shapes: `api_key/2-3`, `http/1-2`, `mutual_tls/0-1`, `oauth2/1-2`, or `openid_connect/1-2`. OAuth flow descriptors are expressed using `implicit/2-3`, `password/2-3`, `client_credentials/2-3`, and `authorization_code/3-4` with `scope/2` terms. `openid_connect/2` also accepts a provider-only `flows(Flows)` option for local scope declarations used during security-reference validation; those local flow declarations are not emitted into the derived OpenAPI document. Provider-side validation checks required fields, valid `apiKey` locations, and URL-valued fields in OAuth or OpenID Connect descriptors.

Compilation flags:

```
static
```

Template:

```
security_scheme(Name,Scheme)
```

Mode and number of proofs:

```
security_scheme(?atom,?compound) - zero_or_more
```

Public predicates

discover/3

Discovers and validates OpenID Provider metadata for the given issuer.

Compilation flags:
`static`

Template:
`discover(Issuer,Provider,Options)`
Mode and number of proofs:
`discover(+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Issuer` is a variable:
`instantiation_error`
`Issuer` is not an absolute or allowed issuer URL:
`domain_error(open_id_issuer,Issuer)`

The discovery endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The discovery endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`
The discovered issuer does not match `Issuer`:
`domain_error(open_id_issuer,DiscoveredIssuer)`
A provider metadata URL is not secure:
`domain_error(open_id_provider_metadata_url,URL)`

---

authorization_url/5

Builds an authorization URL and returns the session data needed for the code exchange and ID-token validation.

Compilation flags:
`static`

Template:
`authorization_url(Provider,Request,URL,Session,Options)`
Mode and number of proofs:
`authorization_url(+compound,+compound,-atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Request` is neither a direct options list nor a request wrapper term containing an options list:
`domain_error(open_id_options,Request)`
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Request` is missing a required authorization request option:
`domain_error(open_id_authorization_request,missing(Name))`
A request value that must be an atom is not an atom:
`type_error(atom,Value)`
A scope value is neither an atom nor a list of atoms:
`domain_error(open_id_space_separated_atom,Value)`
The PKCE code verifier is a variable:
`instantiation_error`
The PKCE code verifier is not valid:
`domain_error(open_id_code_verifier,Verifier)`

---

authorization_response/3

Parses an authorization callback URL into either an authorization response or an authorization error term.

Compilation flags:

```
static
```

Template:

```
authorization_response(CallbackURL,Response,Options)
```

Mode and number of proofs:

```
authorization_response(+atom,-compound,+list(compound)) - one_or_error
```

Exceptions:

`Options` is a variable or a partial list:

```
instantiation_error
```

`Options` is neither a variable nor a list:

```
type_error(list,Options)
```

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

`CallbackURL` is not a valid callback URL or relative reference:

```
domain_error(open_id_authorization_response,CallbackURL)
```

---

authorization_code/4

Parses an authorization callback URL, validates the session state, and returns the authorization code.

Compilation flags:

```
static
```

Template:

```
authorization_code(CallbackURL,Session,Code,Options)
```

Mode and number of proofs:

```
authorization_code(+atom,+compound,-atom,+list(compound)) - one_or_error
```

Exceptions:

`Options` is a variable or a partial list:

```
instantiation_error
```

`Options` is neither a variable nor a list:

```
type_error(list,Options)
```

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

`Session` is missing required state data:

```
domain_error(open_id_session,missing(Session,state))
```

The callback response is an authorization error:
`domain_error(open_id_authorization_response,authorization_error(Response))`
The callback response state does not match the session state:
`domain_error(open_id_authorization_response,state_mismatch(Expected,Actual))`

---

exchange_code/5

Exchanges an authorization code for token response data.

Compilation flags:
`static`

Template:
`exchange_code(Provider,Code,Session,Tokens,Options)`
Mode and number of proofs:
`exchange_code(+compound,+atom,+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Session` is missing required authorization-code exchange data:
`domain_error(open_id_session,missing(Session,Name))`
The token endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The token endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`
The token endpoint JSON response is missing a required member:
`domain_error(open_id_token_response,missing(Name))`

---

refresh_token/4

Exchanges a refresh token for token response data.

Compilation flags:
`static`

Template:
`refresh_token(Provider,RefreshToken,Tokens,Options)`
Mode and number of proofs:

`refresh_token(+compound,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The `client_id` option is missing:
`domain_error(open_id_refresh_token,missing(client_id))`
The token endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The token endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`
The token endpoint JSON response is missing a required member:
`domain_error(open_id_token_response,missing(Name))`

`userinfo/4`

Fetches UserInfo claims using the given access token.

Compilation flags:

`static`

Template:

`userinfo(Provider,AccessToken,Claims,Options)`

Mode and number of proofs:

`userinfo(+compound,+atom,-term,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The provider metadata is missing a UserInfo endpoint:
`domain_error(open_id_provider,missing(userinfo_endpoint))`
The UserInfo endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The UserInfo endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`

logout_url/4

Builds a logout URL for an RP-initiated logout request.

Compilation flags:
`static`

Template:
`logout_url(Provider,Request,URL,Options)`
Mode and number of proofs:
`logout_url(+compound,+compound,-atom,+list(compound))` - `one_or_error`

Exceptions:
`Request` is neither a direct options list nor a request wrapper term containing an options list:
`domain_error(open_id_options,Request)`
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The provider metadata is missing an end-session endpoint:
`domain_error(open_id_provider,missing(end_session_endpoint))`
A request value that must be an atom is not an atom:
`type_error(atom,Value)`
A `ui_locales` value is neither an atom nor a list of atoms:
`domain_error(open_id_space_separated_atom,Value)`
The `post_logout_redirect_uri` is not secure:
`domain_error(open_id_post_logout_redirect_uri,URL)`

jwks/3

Fetches the JSON Web Key Set for the provider.

Compilation flags:
`static`

Template:
`jwks(Provider,JWKSet,Options)`
Mode and number of proofs:
`jwks(+compound,-term,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The JWKS endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The JWKS endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`

`cached_jwks/3`

Returns a cached JWKS for a provider, refreshing it when needed.

Compilation flags:
`static`

Template:
`cached_jwks(Provider,JWKSet,Options)`
Mode and number of proofs:
`cached_jwks(+compound,-term,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The provider metadata is missing a JWKS endpoint:
`domain_error(open_id_provider,missing(jwks_uri))`
The JWKS endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The JWKS endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`

---

verify_id_token/4

Verifies an ID-token using cached JWKS data, refreshing the JWKS once when the token key identifier is unknown.

Compilation flags:

`static`

Template:

`verify_id_token(Token,Provider,Claims,Options)`

Mode and number of proofs:

`verify_id_token(+atom,+compound,-term,+list(compound))` - `zero_or_one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

The provider metadata is missing a JWKS endpoint:

`domain_error(open_id_provider,missing(jwks_uri))`

The JWKS endpoint returned a non-success status:

`domain_error(open_id_http_status,Code)`

The JWKS endpoint response body is not JSON:

`domain_error(open_id_json_response,Body)`

`Token` is a variable:

`instantiation_error`

`Token` is neither a variable nor an atom:

`type_error(atom,Token)`

`Token` is an atom but not a valid compact JWT:

`domain_error(jwt_compact_serialization,Token)`

`Token` contains Base64URL data with characters outside the Base64URL alphabet:

`representation_error(base64)`

The JWT header does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(open_id_jwt_algorithm,Algorithm)`

`JWKSet` is not a JSON Web Key Set with a `keys` list:

`domain_error(jwt_jwks,JWKSet)`

No compatible key exists for the JWT header:

`existence_error(jwt_jwk,Header)`

The selected JWK is not a supported public key:

`domain_error(jwt_jwk_public_key,Key)`

The ES256 signature is not 64 bytes long:

`domain_error(jwt_es256_signature,Signature)`

The OpenSSL executable does not exist:

`existence_error(os_command,Executable)`

The `iss` claim does not match the provider issuer:

`domain_error(open_id_claim(iss),Value)`

A required OpenID ID-token claim is missing:

`domain_error(open_id_claims,missing(Name))`

The expected audience option is missing:

`domain_error(open_id_claims,missing(expected_audience))`

An OpenID ID-token claim has an invalid value:

`domain_error(open_id_claim(Name),Value)`

An OpenID ID-token time claim value is not a number:

`type_error(time_number,Name-Time)`

---

verify_id_token/5

Verifies an ID-token signature and claims using the given provider metadata and JWKS.

Compilation flags:

`static`

Template:

`verify_id_token(Token,Provider,JWKSet,Claims,Options)`

Mode and number of proofs:

`verify_id_token(+atom,+compound,+term,-term,+list(compound))` - `zero_or_one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Token` is a variable:

`instantiation_error`

`Token` is neither a variable nor an atom:

`type_error(atom,Token)`

`Token` is an atom but not a valid compact JWT:

`domain_error(jwt_compact_serialization,Token)`

`Token` contains Base64URL data with characters outside the Base64URL alphabet:

`representation_error(base64)`

The JWT header does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(open_id_jwt_algorithm,Algorithm)`

`JWKSet` is not a JSON Web Key Set with a `keys` list:

`domain_error(jwt_jwks,JWKSet)`

No compatible key exists for the JWT header:

`existence_error(jwt_jwk,Header)`
The selected JWK is not a supported public key:
`domain_error(jwt_jwk_public_key,Key)`
The ES256 signature is not 64 bytes long:
`domain_error(jwt_es256_signature,Signature)`
The OpenSSL executable does not exist:
`existence_error(os_command,Executable)`
The `iss` claim does not match the provider issuer:
`domain_error(open_id_claim(iss),Value)`
A required OpenID ID-token claim is missing:
`domain_error(open_id_claims,missing(Name))`
The expected audience option is missing:
`domain_error(open_id_claims,missing(expected_audience))`
An OpenID ID-token claim has an invalid value:
`domain_error(open_id_claim(Name),Value)`
An OpenID ID-token time claim value is not a number:
`type_error(time_number,Name-Time)`

Protected predicates

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.243.2 `open_id_client`

HTTP-facing OpenID Connect client predicates.

Availability:
`logtalk_load(open_id(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-09

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *open_id_helpers*
Uses:

base64
http_client
http_core
list
open_id_discovery
user

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *discover/3*
  - *jwks/3*
  - *exchange_code/5*
  - *refresh_token/4*
  - *userinfo/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

discover/3

Discovers and validates OpenID Provider metadata for the given issuer.

Compilation flags:
`static`

Template:
`discover(Issuer,Provider,Options)`
Mode and number of proofs:
`discover(+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Issuer` is a variable:
`instantiation_error`

`Issuer` is not an absolute or allowed issuer URL:
`domain_error(open_id_issuer,Issuer)`
The discovery endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The discovery endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`
The discovered issuer does not match `Issuer`:
`domain_error(open_id_issuer,DiscoveredIssuer)`
A provider metadata URL is not secure:
`domain_error(open_id_provider_metadata_url,URL)`

`jwks/3`

Fetches the JSON Web Key Set for the given provider metadata.

Compilation flags:
`static`

Template:
`jwks(Provider,JWKSet,Options)`
Mode and number of proofs:
`jwks(+compound,-term,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The JWKS endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The JWKS endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`

---

exchange_code/5

Exchanges an authorization code for token response data.

Compilation flags:
`static`

Template:
`exchange_code(Provider,Code,Session,Tokens,Options)`
Mode and number of proofs:
`exchange_code(+compound,+atom,+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Session` is missing required authorization-code exchange data:
`domain_error(open_id_session,missing(Session,Name))`
The token endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The token endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`
The token endpoint JSON response is missing a required member:
`domain_error(open_id_token_response,missing(Name))`

---

refresh_token/4

Exchanges a refresh token for token response data.

Compilation flags:
`static`

Template:
`refresh_token(Provider,RefreshToken,Tokens,Options)`
Mode and number of proofs:
`refresh_token(+compound,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The `client_id` option is missing:
`domain_error(open_id_refresh_token,missing(client_id))`
The token endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The token endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`
The token endpoint JSON response is missing a required member:
`domain_error(open_id_token_response,missing(Name))`

`userinfo/4`

Fetches UserInfo claims using the given access token.

Compilation flags:
`static`

Template:
`userinfo(Provider,AccessToken,Claims,Options)`
Mode and number of proofs:
`userinfo(+compound,+atom,-term,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The provider metadata is missing a UserInfo endpoint:
`domain_error(open_id_provider,missing(userinfo_endpoint))`
The UserInfo endpoint returned a non-success status:
`domain_error(open_id_http_status,Code)`
The UserInfo endpoint response body is not JSON:
`domain_error(open_id_json_response,Body)`

1.243.3 `open_id_der`

DER and PEM helpers for OpenID Connect JWT signature verification.

Availability:
`logtalk_load(open_id(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-08

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *open_id_helpers*
Uses:
base64
list
user

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *public_key_pem/2*
  - *es256_signature_der/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

public_key_pem/2

Converts a supported JWK public key into PEM SubjectPublicKeyInfo text.

Compilation flags:
`static`

Template:
`public_key_pem(Key,PEM)`
Mode and number of proofs:
`public_key_pem(+term,-atom)` - `one_or_error`

Exceptions:
`Key` is not a supported RSA or P-256 EC public JWK:
`domain_error(open_id_jwk_public_key,Key)`
`Key` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

---

es256_signature_der/2

Converts a raw ES256 signature into DER-encoded ASN.1 form.

Compilation flags:
`static`

Template:
`es256_signature_der(Signature,DER)`
Mode and number of proofs:
`es256_signature_der(+list(byte),-list(byte))` - `one_or_error`

Exceptions:
`Signature` is not a 64-byte raw ES256 signature:
`domain_error(open_id_es256_signature,Signature)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

  - *provider/3*
  - *provider/4*
  - *property/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

discovery_url/2

Builds the discovery metadata URL for an issuer.

Compilation flags:
`static`

Template:
`discovery_url(Issuer,URL)`
Mode and number of proofs:
`discovery_url(+atom,-atom)` - `one_or_error`

Exceptions:
`Issuer` is a variable:
`instantiation_error`
`Issuer` is not an absolute issuer URL:
`domain_error(open_id_issuer,Issuer)`

---

provider/3

Builds validated provider metadata from discovery JSON using default options.

Compilation flags:
`static`

Template:
`provider(ExpectedIssuer,JSON,Provider)`
Mode and number of proofs:
`provider(+atom,+term,-compound)` - `one_or_error`

Exceptions:
The discovered issuer does not match `ExpectedIssuer`:
`domain_error(open_id_issuer,Issuer)`
A provider metadata URL is not secure:
`domain_error(open_id_provider_metadata_url,URL)`

---

provider/4

Builds validated provider metadata from discovery JSON using the given options.

Compilation flags:
`static`

Template:
`provider(ExpectedIssuer,JSON,Provider,Options)`
Mode and number of proofs:
`provider(+atom,+term,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The discovered issuer does not match `ExpectedIssuer`:
`domain_error(open_id_issuer,Issuer)`
A provider metadata URL is not secure:
`domain_error(open_id_provider_metadata_url,URL)`

---

property/3

Looks up a property in validated provider metadata.

Compilation flags:
`static`

Template:
`property(Provider,Name,Value)`
Mode and number of proofs:
`property(+compound,+atom,-term)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

json_member/3

Enumerates JSON object member values for a given key.

Compilation flags:
`static`

Template:
`json_member(Key,Object,Value)`

Mode and number of proofs:
`json_member(+atom,+term,-term)` - `zero_or_more`

---

json_member_default/4

Returns a JSON object member value or a default when the key is absent.

Compilation flags:
`static`

Template:
`json_member_default(Key,Object,Default,Value)`

Mode and number of proofs:
`json_member_default(+atom,+term,+term,-term)` - `one`

---

provider_property/3

Looks up a property in a provider metadata compound term.

Compilation flags:
```
static
```

Template:
```
provider_property(Provider,Name,Value)
```
Mode and number of proofs:
```
provider_property(+compound,+atom,-term) - zero_or_one
```

---

provider_property_default/4

Returns a provider metadata property or a default when the property is absent.

Compilation flags:
```
static
```

Template:
```
provider_property_default(Provider,Name,Default,Value)
```
Mode and number of proofs:
```
provider_property_default(+compound,+atom,+term,-term) - one
```

---

normalize_options_term/2

Normalizes either a direct options list or a named options wrapper term.

Compilation flags:
```
static
```

Template:
```
normalize_options_term(NameOptions,Options)
```
Mode and number of proofs:
```
normalize_options_term(+term,-list(compound)) - one
```

---

query_atom/2

Encodes query parameters as a URL query atom.

Compilation flags:
`static`

Template:
`query_atom(Pairs,Query)`
Mode and number of proofs:
`query_atom(+list(pair),-atom)` - `one_or_error`

Exceptions:
The HTTP body sink is a variable:
`instantiation_error`
The HTTP body sink is not a valid sink term:
`domain_error(http_sink,Sink)`
`Pairs` cannot be represented as an HTTP form body:
`domain_error(http_body,Body)`
The HTTP body options are invalid:
`domain_error(http_body_options,Options)`

---

space_atom/2

Converts an atom or list of atoms into a space-separated atom.

Compilation flags:
`static`

Template:
`space_atom(Value,Atom)`
Mode and number of proofs:
`space_atom(+term,-atom)` - `one_or_error`

Exceptions:
`Value` is neither an atom nor a list of atoms:
`domain_error(open_id_space_separated_atom,Value)`

---

url_scheme/2

Extracts the scheme from an absolute URL atom.

Compilation flags:
`static`

Template:
`url_scheme(URL,Scheme)`
Mode and number of proofs:
`url_scheme(+atom,-atom)` - `zero_or_one`

---

https_url/1

Succeeds when the URL uses the https scheme.

Compilation flags:
`static`

Template:
`https_url(URL)`
Mode and number of proofs:
`https_url(+atom)` - `zero_or_one`

---

localhost_http_url/1

Succeeds when the URL uses http for a localhost or loopback host.

Compilation flags:
`static`

Template:
`localhost_http_url(URL)`
Mode and number of proofs:
`localhost_http_url(+atom)` - `zero_or_one`

---

ensure_absolute_url/2

Validates that a value is an absolute URL for the given domain label.

Compilation flags:

```
static
```

Template:

```
ensure_absolute_url(Domain,URL)
```

Mode and number of proofs:

```
ensure_absolute_url(+atom,+atom) - one_or_error
```

Exceptions:

`URL` is a variable:

```
instantiation_error
```

`URL` is not an absolute URL atom:

```
domain_error(Domain,URL)
```

---

ensure_secure_url/3

Validates that a URL uses https or an allowed localhost exception.

Compilation flags:

```
static
```

Template:

```
ensure_secure_url(Domain,URL,Options)
```

Mode and number of proofs:

```
ensure_secure_url(+atom,+atom,+list(compound)) - one_or_error
```

Exceptions:

`URL` is a variable:

```
instantiation_error
```

`URL` is not an absolute URL atom:

```
domain_error(Domain,URL)
```

`URL` is not secure and is not an allowed localhost HTTP URL:

```
domain_error(Domain,URL)
```

---

atom_bytes/2

Converts between an atom and its byte list representation.

Compilation flags:
`static`

Template:
`atom_bytes(Atom,Bytes)`
Mode and number of proofs:
`atom_bytes(+atom,-list(byte))` - `one`
`atom_bytes(-atom,+list(byte))` - `one`

---

bytes_atom/2

Converts a byte list into an atom.

Compilation flags:
`static`

Template:
`bytes_atom(Bytes,Atom)`
Mode and number of proofs:
`bytes_atom(+list(byte),-atom)` - `one`

---

base64url_atom_bytes/2

Converts between unpadded Base64URL atoms and byte lists.

Compilation flags:
`static`

Template:
`base64url_atom_bytes(Atom,Bytes)`
Mode and number of proofs:
`base64url_atom_bytes(+atom,-list(byte))` - `one_or_error`
`base64url_atom_bytes(-atom,+list(byte))` - `one_or_error`

Exceptions:
`Atom` is a variable or the sink is a variable:
`instantiation_error`
`Atom` is neither a variable nor a valid Base64URL source term:
`domain_error(base64url_source,codes(Codes))`
`Bytes` cannot be encoded in the requested Base64URL sink representation:
`domain_error(base64url_sink,codes(Codes))`

`Atom` contains Base64URL data with characters outside the Base64URL alphabet:
`representation_error(base64)`

`json_object_pairs/2`

Extracts the key-value pairs from a JSON object term.

Compilation flags:
`static`

Template:
`json_object_pairs(Object,Pairs)`
Mode and number of proofs:
`json_object_pairs(+term,-list(compound))` - `zero_or_one`

`pair_key_value/3`

Extracts the key and value from a JSON pair compound term.

Compilation flags:
`static`

Template:
`pair_key_value(Pair,Key,Value)`
Mode and number of proofs:
`pair_key_value(+compound,-term,-term)` - `one`

`append_query/3`

Appends a query atom to an endpoint URL, preserving any existing query.

Compilation flags:
`static`

Template:
`append_query(Endpoint,Query,URL)`
Mode and number of proofs:
`append_query(+atom,+atom,-atom)` - `one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.243.6 `open_id_jwks`

JSON Web Key Set parsing and key selection helpers.

Availability:
`logtalk_load(open_id(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-08

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *open_id_helpers*
Uses:
list

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *select_key/3*
  - *header_algorithm/2*
  - *header_key_id/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

select_key/3

Selects a matching verification key from a JWK Set for a JWT header.

Compilation flags:
`static`

Template:
`select_key(JWKSet,Header,Key)`
Mode and number of proofs:
`select_key(+term,+term,-term)` - `one_or_error`

Exceptions:
`JWKSet` is not a JSON Web Key Set with a `keys` list:
`domain_error(open_id_jwks,JWKSet)`
`Header` does not contain a valid `alg` member:
`domain_error(open_id_jwt_header,Header)`
No compatible key exists for `Header`:
`existence_error(open_id_jwk,Header)`

---

header_algorithm/2

Extracts and validates the JWT header algorithm.

Compilation flags:
`static`

Template:
`header_algorithm(Header,Algorithm)`
Mode and number of proofs:
`header_algorithm(+term,-atom)` - `one_or_error`

Exceptions:
`Header` does not contain a valid `alg` member:
`domain_error(open_id_jwt_header,Header)`

---

header_key_id/2

Extracts the optional key identifier from a JWT header.

Compilation flags:
`static`

Template:
`header_key_id(Header,KeyId)`
Mode and number of proofs:
`header_key_id(+term,-atom)` - `zero_or_one`

1.243.7 open_id_jwks_cache

JWKS caching and key-rotation helpers.

Availability:
`logtalk_load(open_id(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-12

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *open_id_helpers*
Uses:
open_id_client
open_id_jwt
os

Remarks:
(none)

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *cached_jwks/3*
  - *verify_id_token/4*
  - *clear/0*
  - *clear/1*
- *Protected predicates*
- *Private predicates*
  - *cached_jwks_/3*
- *Operators*

Public predicates

cached_jwks/3

Returns a cached JWKS for a provider, refreshing it when the cache is stale or missing.

Compilation flags:

`static`

Template:

`cached_jwks(Provider,JWKSet,Options)`

Mode and number of proofs:

`cached_jwks(+compound,-term,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

The provider metadata is missing a JWKS endpoint:

`domain_error(open_id_provider,missing(jwks_uri))`

The JWKS endpoint returned a non-success status:

`domain_error(open_id_http_status,Code)`

The JWKS endpoint response body is not JSON:

`domain_error(open_id_json_response,Body)`

verify_id_token/4

Verifies an ID-token using cached JWKS data, refreshing the cache once when the token key identifier is unknown.

Compilation flags:

`static`

Template:

`verify_id_token(Token,Provider,Claims,Options)`

Mode and number of proofs:

`verify_id_token(+atom,+compound,-term,+list(compound))` - `zero_or_one_or_error`

Exceptions:

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

The provider metadata is missing a JWKS endpoint:

`domain_error(open_id_provider,missing(jwks_uri))`

The JWKS endpoint returned a non-success status:

`domain_error(open_id_http_status,Code)`

The JWKS endpoint response body is not JSON:

`domain_error(open_id_json_response,Body)`

`Token` is a variable:

`instantiation_error`

`Token` is neither a variable nor an atom:

`type_error(atom,Token)`

`Token` is an atom but not a valid compact JWT:

`domain_error(jwt_compact_serialization,Token)`

`Token` contains Base64URL data with characters outside the Base64URL alphabet:

`representation_error(base64)`

The JWT header does not contain a valid `alg` member:

`domain_error(jwt_header,Header)`

The JWT algorithm is unsupported or disallowed:

`domain_error(open_id_jwt_algorithm,Algorithm)`

`JWKSet` is not a JSON Web Key Set with a `keys` list:

`domain_error(jwt_jwks,JWKSet)`

No compatible key exists for the JWT header:

`existence_error(jwt_jwk,Header)`

The selected JWK is not a supported public key:

`domain_error(jwt_jwk_public_key,Key)`

The ES256 signature is not 64 bytes long:

`domain_error(jwt_es256_signature,Signature)`

The OpenSSL executable does not exist:

`existence_error(os_command,Executable)`

The `iss` claim does not match the provider issuer:

```
domain_error(open_id_claim(iss),Value)
```

A required OpenID ID-token claim is missing:

```
domain_error(open_id_claims,missing(Name))
```

The expected audience option is missing:

```
domain_error(open_id_claims,missing(expected_audience))
```

An OpenID ID-token claim has an invalid value:

```
domain_error(open_id_claim(Name),Value)
```

An OpenID ID-token time claim value is not a number:

```
type_error(time_number,Name-Time)
```

---

clear/0

Clears all cached JWKS entries.

Compilation flags:

```
static
```

Mode and number of proofs:

```
clear - one
```

---

clear/1

Clears the cached JWKS entry for a provider.

Compilation flags:

```
static
```

Template:

```
clear(Provider)
```

Mode and number of proofs:

```
clear(+compound) - one_or_error
```

Exceptions:

The provider metadata is missing a JWKS endpoint:

```
domain_error(open_id_provider,missing(jwks_uri))
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

cached_jwks_/3

Cached JWKS entries indexed by URI and fetch time.

Compilation flags:
dynamic

Template:
cached_jwks_(URI,FetchedAt,JWKSet)
Mode and number of proofs:
cached_jwks_(?atom,?number,?term) - zero_or_more

Operators

(none)
object

1.243.8 open_id_jwt

JWT parsing and ID-token verification helpers.

Availability:
logtalk_load(open_id(loader))

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-08

Compilation flags:
static, context_switching_calls

Imports:
public *open_id_helpers*
Uses:
jwt
jwt_jwa
list
os

Remarks:
(none)

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *decode/3*
  - *verify_id_token/5*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

decode/3

Decodes a JWT into its header and claims JSON terms without verifying the signature.

Compilation flags:

```
static
```

Template:

```
decode(Token,Header,Claims)
```

Mode and number of proofs:

```
decode(+atom,-term,-term) - one_or_error
```

Exceptions:

`Token` is a variable:

```
instantiation_error
```

`Token` is neither a variable nor an atom:

```
type_error(atom,Token)
```

`Token` is an atom but not a valid compact JWT:

```
domain_error(jwt_compact_serialization,Token)
```

`Token` contains Base64URL data with characters outside the Base64URL alphabet:

```
representation_error(base64)
```

---

verify_id_token/5

Verifies an ID-token signature and claims using the given provider metadata and JWKS.

Compilation flags:

```
static
```

Template:

```
verify_id_token(Token,Provider,JWKSet,Claims,Options)
```

Mode and number of proofs:

```
verify_id_token(+atom,+compound,+term,-term,+list(compound)) -
zero_or_one_or_error
```

Exceptions:

`Options` is a variable or a partial list:
```
instantiation_error
```
`Options` is neither a variable nor a list:
```
type_error(list,Options)
```
An element `Option` of the list `Options` is neither a variable nor a compound term:
```
type_error(compound,Option)
```
An element `Option` of the list `Options` is a compound term but not a valid option:
```
domain_error(option,Option)
```
`Token` is a variable:
```
instantiation_error
```
`Token` is neither a variable nor an atom:
```
type_error(atom,Token)
```
`Token` is an atom but not a valid compact JWT:
```
domain_error(jwt_compact_serialization,Token)
```
`Token` contains Base64URL data with characters outside the Base64URL alphabet:
```
representation_error(base64)
```
The JWT header does not contain a valid `alg` member:
```
domain_error(jwt_header,Header)
```
The JWT algorithm is unsupported or disallowed:
```
domain_error(open_id_jwt_algorithm,Algorithm)
```
`JWKSet` is not a JSON Web Key Set with a `keys` list:
```
domain_error(jwt_jwks,JWKSet)
```
No compatible key exists for the JWT header:
```
existence_error(jwt_jwk,Header)
```
The selected JWK is not a supported public key:
```
domain_error(jwt_jwk_public_key,Key)
```
The ES256 signature is not 64 bytes long:
```
domain_error(jwt_es256_signature,Signature)
```
The OpenSSL executable does not exist:
```
existence_error(os_command,Executable)
```
The `iss` claim does not match the provider issuer:
```
domain_error(open_id_claim(iss),Value)
```
A required OpenID ID-token claim is missing:
```
domain_error(open_id_claims,missing(Name))
```
The expected audience option is missing:
```
domain_error(open_id_claims,missing(expected_audience))
```
An OpenID ID-token claim has an invalid value:
```
domain_error(open_id_claim(Name),Value)
```
An OpenID ID-token time claim value is not a number:
```
type_error(time_number,Name-Time)
```

1.243.9 `open_id_logout`

RP-initiated logout URL helpers for OpenID Connect clients.

Availability:
`logtalk_load(open_id(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-08

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *open_id_helpers*
Uses:
list

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *logout_url/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

logout_url/4

Builds a logout URL for an RP-initiated logout request.

Compilation flags:

`static`

Template:

`logout_url(Provider,Request,URL,Options)`

Mode and number of proofs:

`logout_url(+compound,+compound,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Request` is neither a direct options list nor a request wrapper term containing an options list:

`domain_error(open_id_options,Request)`

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

The provider metadata is missing an end-session endpoint:

`domain_error(open_id_provider,missing(end_session_endpoint))`

A request value that must be an atom is not an atom:

`type_error(atom,Value)`

A `ui_locales` value is neither an atom nor a list of atoms:

`domain_error(open_id_space_separated_atom,Value)`

The `post_logout_redirect_uri` is not secure:

`domain_error(open_id_post_logout_redirect_uri,URL)`

- *Public predicates*
  - *verify/5*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

verify/5

Verifies a JWT signing input and signature using OpenSSL and a PEM public key.

Compilation flags:
`static`

Template:

```
verify(Algorithm,PEM,SigningInput,Signature,Options)
```

Mode and number of proofs:

```
verify(+atom,+atom,+atom,+list(byte),+list(compound)) - zero_or_one_or_error
```

Exceptions:

The OpenSSL executable does not exist:

```
existence_error(os_command,Executable)
```

`Signature` is not a 64-byte raw ES256 signature:

```
domain_error(open_id_es256_signature,Signature)
```

1.243.11 `open_id_pkce`

PKCE and authorization-request helpers for OpenID Connect clients.

Availability:

```
logtalk_load(open_id(loader))
```

Author: Paulo Moura
Version: 1:0:1
Date: 2026-10-07

Compilation flags:

```
static, context_switching_calls
```

Imports:

```
public open_id_helpers
```

Uses:

crypto
sha256

Remarks:

(none)

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *code_verifier/2*
  - *code_challenge/2*
  - *authorization_url/5*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

code_verifier/2

Returns a valid PKCE code verifier, either provided in options or freshly generated.

Compilation flags:

```
static
```

Template:

```
code_verifier(Verifier,Options)
```

Mode and number of proofs:

```
code_verifier(-atom,+list(compound)) - one_or_error
```

Exceptions:

`Options` is a variable or a partial list:

```
instantiation_error
```

`Options` is neither a variable nor a list:

```
type_error(list,Options)
```

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

`Verifier` is a variable:

```
instantiation_error
```

`Verifier` is not a valid PKCE code verifier:

```
domain_error(open_id_code_verifier,Verifier)
```

---

code_challenge/2

Computes the S256 PKCE code challenge for a code verifier.

Compilation flags:

```
static
```

Template:

```
code_challenge(Verifier,Challenge)
```

Mode and number of proofs:

`code_challenge(+atom,-atom)` - `one_or_error`

Exceptions:

`Verifier` is a variable:

`instantiation_error`

`Verifier` is not a valid PKCE code verifier:

`domain_error(open_id_code_verifier,Verifier)`

`authorization_url/5`

Builds an authorization URL and session data for an Authorization Code plus PKCE flow.

Compilation flags:

`static`

Template:

`authorization_url(Provider,Request,URL,Session,Options)`

Mode and number of proofs:

`authorization_url(+compound,+compound,-atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Request` is neither a direct options list nor a request wrapper term containing an options list:

`domain_error(open_id_options,Request)`

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Request` is missing a required authorization request option:

`domain_error(open_id_authorization_request,missing(Name))`

A request value that must be an atom is not an atom:

`type_error(atom,Value)`

A scope value is neither an atom nor a list of atoms:

`domain_error(open_id_space_separated_atom,Value)`

The PKCE code verifier is a variable:

`instantiation_error`

The PKCE code verifier is not valid:

`domain_error(open_id_code_verifier,Verifier)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

1.243.12 `open_id_response`

Authorization callback parsing and state validation helpers.

Availability:
`logtalk_load(open_id(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-08

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *open_id_helpers*
Uses:
http_core
list
url(Representation)
user

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *authorization_response/3*
  - *authorization_code/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

authorization_response/3

Parses an authorization callback URL into either an authorization response or an authorization error term.

Compilation flags:
`static`

Template:
`authorization_response(CallbackURL,Response,Options)`
Mode and number of proofs:
`authorization_response(+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`CallbackURL` is a variable:
`instantiation_error`
`CallbackURL` is not a valid URL or relative reference:
`domain_error(open_id_authorization_response,CallbackURL)`
The callback URL does not contain a query component and fragment parsing is not allowed:
`domain_error(open_id_authorization_response,missing(parameters))`
The callback response is missing a required member:
`domain_error(open_id_authorization_response,missing(Name))`
The callback issuer does not match the provider issuer:
`domain_error(open_id_authorization_response,issuer_mismatch(Expected,Actual))`

---

authorization_code/4

Parses an authorization callback URL, validates the returned state against the session, and returns the authorization code.

Compilation flags:
`static`

Template:
`authorization_code(CallbackURL,Session,Code,Options)`
Mode and number of proofs:
`authorization_code(+atom,+compound,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Options` is a variable or a partial list:
```
instantiation_error
```
`Options` is neither a variable nor a list:
```
type_error(list,Options)
```
An element `Option` of the list `Options` is neither a variable nor a compound term:
```
type_error(compound,Option)
```
An element `Option` of the list `Options` is a compound term but not a valid option:
```
domain_error(option,Option)
```
`Session` is missing required state data:
```
domain_error(open_id_session,missing(Session,state))
```
The callback response is an authorization error:
```
domain_error(open_id_authorization_response,authorization_error(Response))
```
The callback response state does not match the session state:
```
domain_error(open_id_authorization_response,state_mismatch(Expected,Actual))
```
The callback response is missing a required member:
```
domain_error(open_id_authorization_response,missing(Name))
```

Operators

(none)

1.244 optics_clusterer

object

1.244.1 `optics_clusterer`

OPTICS clusterer for continuous datasets. Learns an ordering from a dataset object implementing the `clustering_dataset_protocol` protocol and extracts clusters using an epsilon threshold so the result can be used with the standard clusterer protocol.

Availability:
```
logtalk_load(optics_clusterer(loader))
```

Author: Paulo Moura
Version: 1:3:0
Date: 2026-11-19

Compilation flags:
```
static, context_switching_calls
```

Imports:

`public` *clusterer_common*
`public` *search_indexing*

Uses:

avltree
binary_heap_min
format
list
numberlist
type

Remarks:

(none)

Inherited public predicates:

check_clusterer/1 *check_option/1* *check_options/1* *cluster/3* *clusterer_options/2* *default_option/1* *default_options/1* *diagnostic/2* *diagnostics/2* *export_to_clauses/4* *export_to_file/4* *learn/2* *learn/3* *option/2* *option/3* *print_clusterer/1* *valid_clusterer/1* *valid_option/1* *valid_options/1*

1.245 optionals

object

1.245.1 `maybe`

Types and predicates for type-checking and handling optional terms. Inspired by Haskell.

Availability:
`logtalk_load(optionals(loader))`

Author: Paulo Moura
Version: 0:9:0
Date: 2025-06-19

Compilation flags:
`static, context_switching_calls`

Provides:
type::type/1
type::check/2
arbitrary::arbitrary/1
arbitrary::arbitrary/2
arbitrary::shrinker/1
arbitrary::shrink/3
arbitrary::edge_case/2

Uses:
optional
optional(Optional)
random
type

Remarks:

- Type-checking support: Defines type `maybe(Type)` for checking optional terms where the value hold by the optional term must be of the given type.
- QuickCheck support: Defines clauses for the `arbitrary::arbitrary/1-2`, `arbitrary::shrinker/1`, `arbitrary::shrink/3`, and `arbitrary::edge_case/2` predicates to allow generating random values for the `maybe(Type)` type.

Inherited public predicates:
(none)

- *Public predicates*
  - *cat/2*
  - *sequence/2*
  - *traverse/3*
- *Protected predicates*

- *Private predicates*
- *Operators*

Public predicates

cat/2

Returns the values stored in the non-empty optional terms.

Compilation flags:
`static`

Template:
`cat(Optionals,Values)`
Mode and number of proofs:
`cat(+list(optional),-list)` - `one`

---

sequence/2

Returns an optional term with a list of all values when all optional terms are not empty. Otherwise returns an empty optional term.

Compilation flags:
`static`

Template:
`sequence(Optionals,Optional)`
Mode and number of proofs:
`sequence(+list(optional),--nonvar)` - `one`

---

traverse/3

Applies a closure to each list element to generate optional terms and then sequences them into a single optional term holding all values or an empty optional term.

Compilation flags:
`static`

Template:
`traverse(Closure,Terms,Optional)`
Meta-predicate template:
`traverse(2,*,*)`
Mode and number of proofs:
`traverse(+callable,+list,--nonvar)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

optional, *optional(Optional)*, *type*, *arbitrary*

object

1.245.2 `optional`

Constructors for optional terms. An optional term is either empty or holds a value. Optional terms should be regarded as opaque terms and always used with the `optional/1` object by passing the optional term as a parameter.

Availability:
`logtalk_load(optionals(loader))`

Author: Paulo Moura
Version: 2:2:0
Date: 2026-02-21

Compilation flags:
`static, context_switching_calls`

Provides:
type::type/1
type::check/2

Remarks:

- Type-checking support: This object also defines a type `optional` for use with the `type` library object.

Inherited public predicates:
(none)

- *Public predicates*
  - *empty/1*
  - *of/2*
  - *from_goal/3*
  - *from_goal/2*

      - *from_generator/3*

      - *from_goal_or_throw/2*
    - *Protected predicates*
    - *Private predicates*
    - *Operators*

Public predicates

empty/1

Constructs an empty optional term.

Compilation flags:
`static`

Template:
`empty(Optional)`
Mode and number of proofs:
`empty(--nonvar)` - `one`

---

of/2

Constructs an optional term holding the given value.

Compilation flags:
`static`

Template:
`of(Value,Optional)`
Mode and number of proofs:
`of(@term,--nonvar)` - `one`

---

from_goal/3

Constructs an optional term holding a value bound by calling the given goal. Returns an empty optional term if the goal fails. Also returns an empty optional term if the goal throws an error, silently discarding the error information. Use `from_goal_or_throw/3` if exceptions should be propagated or the `expected` library `from_goal/3` predicate if error information should be preserved.

Compilation flags:
`static`

Template:

```
from_goal(Goal,Value,Optional)
```

Meta-predicate template:

```
from_goal(0,*,*)
```

Mode and number of proofs:

```
from_goal(+callable,--term,--nonvar) - one
```

---

from_goal/2

Constructs an optional term holding a value bound by calling the given closure. Returns an empty optional term if the closure fails. Also returns an empty optional term if the closure throws an error, silently discarding the error information. Use `from_goal_or_throw/2` if exceptions should be propagated or the `expected` library `from_goal/2` predicate if error information should be preserved.

Compilation flags:

```
static
```

Template:

```
from_goal(Closure,Optional)
```

Meta-predicate template:

```
from_goal(1,*)
```

Mode and number of proofs:

```
from_goal(+callable,--nonvar) - one
```

---

from_generator/3

Constructs optional terms with the values generated by calling the given goal. On goal failure, returns an empty optional. On goal error, also returns an empty optional, silently discarding the error information.

Compilation flags:

```
static
```

Template:

```
from_generator(Goal,Value,Optional)
```

Meta-predicate template:

```
from_generator(0,*,*)
```

Mode and number of proofs:

```
from_generator(+callable,--term,--nonvar) - one_or_more
```

---

from_generator/2

Constructs optional terms with the values generated by calling the given closure. On closure failure, returns an empty optional. On closure error, also returns an empty optional, silently discarding the error information.

Compilation flags:
```
static
```

Template:
```
from_generator(Closure,Optional)
```
Meta-predicate template:
```
from_generator(1,*)
```
Mode and number of proofs:
```
from_generator(+from_generator,--nonvar) - one_or_more
```

---

from_goal_or_throw/3

Constructs an optional term holding a value bound by calling the given goal. Returns an empty optional term if the goal fails. Propagates any exception thrown by the goal.

Compilation flags:
```
static
```

Template:
```
from_goal_or_throw(Goal,Value,Optional)
```
Meta-predicate template:
```
from_goal_or_throw(0,*,*)
```
Mode and number of proofs:
```
from_goal_or_throw(+callable,--term,--nonvar) - one_or_error
```

---

from_goal_or_throw/2

Constructs an optional term holding a value bound by calling the given closure. Returns an empty optional term if the closure fails. Propagates any exception thrown by the closure.

Compilation flags:
```
static
```

Template:
```
from_goal_or_throw(Closure,Optional)
```
Meta-predicate template:
```
from_goal_or_throw(1,*)
```
Mode and number of proofs:
```
from_goal_or_throw(+callable,--nonvar) - one_or_error
```

    - *map_or_else/3*
    - *zip/3*
    - *flatten/1*
    - *to_expected/2*
  - *Protected predicates*
  - *Private predicates*
  - *Operators*

Public predicates

is_empty/0

True if the optional term is empty. See also the `if_empty/1` predicate.

Compilation flags:
`static`

Mode and number of proofs:
`is_empty` - `zero_or_one`

---

is_present/0

True if the optional term holds a value. See also the `if_present/1` predicate.

Compilation flags:
`static`

Mode and number of proofs:
`is_present` - `zero_or_one`

---

if_empty/1

Calls a goal if the optional term is empty. Succeeds otherwise.

Compilation flags:
`static`

Template:
`if_empty(Goal)`
Meta-predicate template:
`if_empty(0)`
Mode and number of proofs:
`if_empty(+callable)` - `zero_or_more`

---

if_present/1

Applies a closure to the value hold by the optional term if not empty. Succeeds otherwise.

Compilation flags:
`static`

Template:
`if_present(Closure)`
Meta-predicate template:
`if_present(1)`
Mode and number of proofs:
`if_present(+callable)` - `zero_or_more`

---

if_present_or_else/2

Applies a closure to the value hold by the optional term if not empty. Otherwise calls the given goal.

Compilation flags:
`static`

Template:
`if_present_or_else(Closure,Goal)`
Meta-predicate template:
`if_present_or_else(1,0)`
Mode and number of proofs:
`if_present_or_else(+callable,+callable)` - `zero_or_more`

---

filter/2

Returns the optional term when it is not empty and the value it holds satisfies a closure. Otherwise returns an empty optional term.

Compilation flags:
```
static
```

Template:
```
filter(Closure,NewOptional)
```
Meta-predicate template:
```
filter(1,*)
```
Mode and number of proofs:
```
filter(+callable,--nonvar) - one
```

---

map/2

When the optional term is not empty and mapping a closure with the value it holds and the new value as additional arguments is successful, returns an optional term with the new value. Otherwise returns an empty optional term.

Compilation flags:
```
static
```

Template:
```
map(Closure,NewOptional)
```
Meta-predicate template:
```
map(2,*)
```
Mode and number of proofs:
```
map(+callable,--nonvar) - one
```

---

flat_map/2

When the optional term is not empty and mapping a closure with the value it holds and the new optional term as additional arguments is successful, returns the new optional term. Otherwise returns an empty optional term.

Compilation flags:
```
static
```

Template:
```
flat_map(Closure,NewOptional)
```
Meta-predicate template:
```
flat_map(2,*)
```
Mode and number of proofs:
```
flat_map(+callable,--nonvar) - one
```

---

or/2

Returns the same optional term if not empty. Otherwise calls closure to generate a new optional term. Fails if optional term is empty and calling the closure fails or throws an error.

Compilation flags:
```
static
```

Template:
```
or(NewOptional,Closure)
```
Meta-predicate template:
```
or(*,1)
```
Mode and number of proofs:
```
or(--term,@callable) - zero_or_one
```

---

get/1

Returns the value hold by the optional term if not empty. Throws an error otherwise.

Compilation flags:
```
static
```

Template:
```
get(Value)
```
Mode and number of proofs:
```
get(--term) - one_or_error
```

Exceptions:
Optional is empty:
```
existence_error(optional_term,Optional)
```

---

or_else/2

Returns the value hold by the optional term if not empty or the given default value if the optional term is empty.

Compilation flags:
```
static
```

Template:
```
or_else(Value,Default)
```
Mode and number of proofs:
```
or_else(--term,@term) - one
```

---

or_else_get/2

Returns the value hold by the optional term if not empty. Applies a closure to compute the value otherwise. Throws an error when the optional term is empty and the value cannot be computed.

Compilation flags:
`static`

Template:
`or_else_get(Value,Closure)`
Meta-predicate template:
`or_else_get(*,1)`
Mode and number of proofs:
`or_else_get(--term,+callable)` - `one_or_error`

Exceptions:
Optional is empty and the term cannot be computed:
`existence_error(optional_term,Optional)`

---

or_else_call/2

Returns the value hold by the optional term if not empty or calls a goal deterministically if the optional term is empty.

Compilation flags:
`static`

Template:
`or_else_call(Value,Goal)`
Meta-predicate template:
`or_else_call(*,0)`
Mode and number of proofs:
`or_else_call(--term,+callable)` - `zero_or_one`

---

or_else_fail/1

Returns the value hold by the optional term if not empty. Fails otherwise. Usually called to skip over empty optional terms.

Compilation flags:
`static`

Template:
`or_else_fail(Value)`
Mode and number of proofs:
`or_else_fail(--term)` - `zero_or_one`

---

or_else_throw/2

Returns the value hold by the optional term if not empty. Throws the given error otherwise.

Compilation flags:
```
static
```

Template:
```
or_else_throw(Value,Error)
```
Mode and number of proofs:
```
or_else_throw(--term,@nonvar) - one_or_error
```

---

map_or_else/3

When the optional term is not empty and mapping a closure with the value it holds and the new value as additional arguments is successful, returns the new value. Otherwise returns the given default value.

Compilation flags:
```
static
```

Template:
```
map_or_else(Closure,Default,Value)
```
Meta-predicate template:
```
map_or_else(2,*,*)
```
Mode and number of proofs:
```
map_or_else(+callable,@term,--term) - one
```

---

zip/3

When both this optional and the other optional hold values and applying a closure with both values and the new value as additional arguments is successful, returns an optional term with the new value. Otherwise returns an empty optional term.

Compilation flags:
```
static
```

Template:
```
zip(Closure,OtherOptional,NewOptional)
```
Meta-predicate template:
```
zip(3,*,*)
```
Mode and number of proofs:
```
zip(+callable,+nonvar,--nonvar) - one
```

---

flatten/1

Flattens a nested optional term. When the optional term holds a value that is itself an optional term, returns the inner optional term. When the optional term holds a non-optional value, returns the same optional term. When the optional term is empty, returns an empty optional term.

Compilation flags:

```
static
```

Template:

```
flatten(NewOptional)
```

Mode and number of proofs:

```
flatten(--nonvar) - one
```

---

to_expected/2

Converts the optional term to an expected term. Returns an expected term holding the value if the optional term is not empty. Returns an expected term with the given error otherwise.

Compilation flags:

```
static
```

Template:

```
to_expected(Error,Expected)
```

Mode and number of proofs:

```
to_expected(@term,--nonvar) - one
```

Public predicates

check_option/1

Succeeds if the option is valid. Throws an error otherwise.

Compilation flags:
`static`

Template:
`check_option(Option)`
Mode and number of proofs:
`check_option(@term)` - `one_or_error`

Exceptions:
`Option` is a variable:
`instantiation_error`
`Option` is neither a variable nor a compound term:
`type_error(compound,Option)`
`Option` is a compound term but not a valid option:
`domain_error(option,Option)`

---

check_options/1

Succeeds if all the options in a list are valid. Throws an error otherwise.

Compilation flags:
`static`

Template:
`check_options(Options)`
Mode and number of proofs:
`check_options(@term)` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

valid_option/1

Succeeds if the option is valid.

Compilation flags:
`static`

Template:
`valid_option(Option)`
Mode and number of proofs:
`valid_option(@term)` - `zero_or_one`

---

valid_options/1

Succeeds if all the options in a list are valid.

Compilation flags:
`static`

Template:
`valid_options(Options)`
Mode and number of proofs:
`valid_options(@term)` - `one`

---

default_option/1

Enumerates, by backtracking, the default options.

Compilation flags:
`static`

Template:
`default_option(Option)`
Mode and number of proofs:
`default_option(?compound)` - `zero_or_more`

---

default_options/1

Returns a list of the default options.

Compilation flags:
`static`

Template:
`default_options(Options)`
Mode and number of proofs:
`default_options(-list(compound))` - `one`

---

option/2

True iff `Option` unifies with the first occurrence of the same option in the `Options` list.

Compilation flags:
`static`

Template:
`option(Option,Options)`
Mode and number of proofs:
`option(+compound,+list(compound))` - `zero_or_one`

---

option/3

True iff `Option` unifies with the first occurrence of the same option in the `Options` list or, when that is not the case, if `Option` unifies with `Default`.

Compilation flags:
`static`

Template:
`option(Option,Options,Default)`
Mode and number of proofs:
`option(+compound,+list(compound),+compound)` - `zero_or_one`

Protected predicates

merge_options/2

Merges the user options with the default options, returning the final list of options. Calls the `fix_options/2` predicate to preprocess the options after merging. Callers must ensure, if required, that the user options are valid.

Compilation flags:

```
static
```

Template:

```
merge_options(UserOptions,Options)
```

Mode and number of proofs:

```
merge_options(+list(compound),-list(compound)) - one
```

---

fix_options/2

Fixes a list of options, returning the list of options.

Compilation flags:

```
static
```

Template:

```
fix_options(Options,FixedOptions)
```

Mode and number of proofs:

```
fix_options(+list(compound),-list(compound)) - one
```

---

fix_option/2

Fixes an option.

Compilation flags:

```
static
```

Template:

```
fix_option(Option,FixedOption)
```

Mode and number of proofs:

```
fix_option(+compound,-compound) - zero_or_one
```

1.247 os

object

1.247.1 os

Portable operating-system access predicates.

Availability:
`logtalk_load(os(loader))`

Author: Paulo Moura
Version: 1:105:3
Date: 2026-11-13

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *osp*
Uses:
atom
list
Aliases:
`osp` `absolute_file_name/2` as `expand_path/2`

Remarks:

- File path expansion: To ensure portability, all file paths are expanded before being handed to the backend Prolog system.
- Exception terms: Currently, there is no standardization of the exception terms thrown by the different backend Prolog systems.
- B-Prolog portability: The `wall_time/1` predicate is not supported.
- CxProlog portability: The `date_time/7` predicate returns zeros for all arguments.
- JIProlog portability: The `file_permission/2` and `command_line_arguments/1` predicates are not supported.
- Quintus Prolog: The `pid/1` and `shell/2` predicates are not supported.
- XSB portability: The `command_line_arguments/1` predicate is not supported.

Inherited public predicates:

absolute_file_name/2 *change_directory/1* *command_line_arguments/1* *copy_file/2* *cpu_time/1* *date_time/7* *decompose_file_name/3* *decompose_file_name/4* *delete_directory/1* *delete_directory_and_contents/1* *delete_directory_contents/1* *delete_file/1* *directory_exists/1* *directory_files/2* *directory_files/3* *ensure_directory/1* *ensure_file/1* *environment_variable/2* *file_exists/1* *file_modification_time/2* *file_permission/2* *file_size/2* *full_device_path/1* *internal_os_path/2* *is_absolute_file_name/1* *make_directory/1* *make_directory_path/1* *null_device_path/1* *operating_system_machine/1* *operating_system_name/1* *operating_system_release/1* *operating_system_type/1* *path_concat/3* *pid/1* *read_only_device_path/1* *rename_file/2* *resolve_command_path/2* *shell/1* *shell/2* *sleep/1* *temporary_directory/1* *time_stamp/1* *wall_time/1* *working_directory/1*

os

Remarks:

- Provided types: This category adds `file`, `file(Extensions)`, `file(Extensions,Permissions)`, `directory`, `directory(Permissions)`, and `environment_variable` types for type-checking when using the `type` library object.
- Type `file`: For checking if a term is an atom and an existing file.
- Type `file(Extensions)`: For checking if a term is an atom and an existing file with one of the listed extensions (specified as `'.ext'`).
- Type `file(Extensions,Permissions)`: For checking if a term is an atom and an existing file with one of the listed extensions (specified as `'.ext'`) and listed permissions ({`read`, `write`, `execute`}).
- Type `directory`: For checking if a term is an atom and an existing directory.
- Type `directory(Permissions)`: For checking if a term is an atom and an existing directory with the listed permissions ({`read`, `write`, `execute`}).
- Type `environment_variable`: For checking if a term is an atom and an existing environment variable.

Date: 2026-06-10

Compilation flags:

```
static
```

Dependencies:

(none)

Remarks:

- Error handling: Predicates that require a file or directory to exist throw an error when that is not the case. But the exact exception term is currently backend Prolog compiler dependent.
- CPU and wall time accuracy: Depends on the backend and can be different between CPU and wall time (e.g. CPU time can have nanosecond accuracy with wall time only having millisecond accuracy).

Public predicates

pid/1

Returns the process identifier of the running process.

Compilation flags:

```
static
```

Template:

```
pid(PID)
```

Mode and number of proofs:
`pid(-integer)` - `one`

---

shell/2

Runs an operating-system shell command and returns its exit status.

Compilation flags:
`static`

Template:
`shell(Command,Status)`
Mode and number of proofs:
`shell(+atom,-integer)` - `one`

---

shell/1

Runs an operating-system shell command.

Compilation flags:
`static`

Template:
`shell(Command)`
Mode and number of proofs:
`shell(+atom)` - `zero_or_one`

---

is_absolute_file_name/1

True iff the argument is an absolute file path. On POSIX systems, this predicate is true if `File` starts with a `/`. On Windows systems, this predicate is true if `File` starts with a drive letter. No attempt is made to expand `File` as a path.

Compilation flags:
`static`

Template:
`is_absolute_file_name(File)`
Mode and number of proofs:
`is_absolute_file_name(+atom)` - `zero_or_one`

---

absolute_file_name/2

Expands a file name to an absolute file path. An environment variable at the beginning of the file name is also expanded. A slash at the end of `File` is preserved in `Path`.

Compilation flags:

```
static
```

Template:

```
absolute_file_name(File,Path)
```

Mode and number of proofs:

```
absolute_file_name(+atom,-atom) - one
```

---

decompose_file_name/3

Decomposes a file name into its directory (which always ends with a slash; `./` is returned if absent) and its basename (which can be the empty atom).

Compilation flags:

```
static
```

Template:

```
decompose_file_name(File,Directory,Basename)
```

Mode and number of proofs:

```
decompose_file_name(+atom,?atom,?atom) - one
```

---

decompose_file_name/4

Decomposes a file name into its directory (which always ends with a slash; `./` is returned if absent), name (that can be the empty atom), and extension (which starts with a `.` when defined; the empty atom otherwise).

Compilation flags:

```
static
```

Template:

```
decompose_file_name(File,Directory,Name,Extension)
```

Mode and number of proofs:

```
decompose_file_name(+atom,?atom,?atom,?atom) - one
```

---

path_concat/3

Concatenates a path prefix and a path suffix, adding a `/` separator if required. Returns `Suffix` when it is an absolute path. Returns `Prefix` with a trailing `/` appended if missing when `Suffix` is the empty atom.

Compilation flags:
`static`

Template:
`path_concat(Prefix,Suffix,Path)`
Mode and number of proofs:
`path_concat(+atom,+atom,--atom)` - `one`

---

internal_os_path/2

Converts between the internal path representation (which is backend dependent) and the operating-system native path representation.

Compilation flags:
`static`

Template:
`internal_os_path(InternalPath,OSPath)`
Mode and number of proofs:
`internal_os_path(+atom,-atom)` - `one`
`internal_os_path(-atom,+atom)` - `one`

---

make_directory/1

Makes a new directory. Succeeds if the directory already exists.

Compilation flags:
`static`

Template:
`make_directory(Directory)`
Mode and number of proofs:
`make_directory(+atom)` - `one`

---

make_directory_path/1

Makes a new directory creating all the intermediate directories if necessary. Succeeds if the directory already exists.

Compilation flags:
```
static
```

Template:
```
make_directory_path(Directory)
```
Mode and number of proofs:
```
make_directory_path(+atom) - one
```

---

delete_directory/1

Deletes an empty directory. Throws an error if the directory does not exist.

Compilation flags:
```
static
```

Template:
```
delete_directory(Directory)
```
Mode and number of proofs:
```
delete_directory(+atom) - one_or_error
```

---

delete_directory_contents/1

Deletes directory contents. Throws an error if the directory does not exist.

Compilation flags:
```
static
```

Template:
```
delete_directory_contents(Directory)
```
Mode and number of proofs:
```
delete_directory_contents(+atom) - one_or_error
```

---

delete_directory_and_contents/1

Deletes directory and its contents. Throws an error if the directory does not exist.

Compilation flags:
`static`

Template:
`delete_directory_and_contents(Directory)`
Mode and number of proofs:
`delete_directory_and_contents(+atom)` - `one_or_error`

---

change_directory/1

Changes current working directory. Throws an error if the directory does not exist.

Compilation flags:
`static`

Template:
`change_directory(Directory)`
Mode and number of proofs:
`change_directory(+atom)` - `one_or_error`

---

working_directory/1

Current working directory.

Compilation flags:
`static`

Template:
`working_directory(Directory)`
Mode and number of proofs:
`working_directory(?atom)` - `zero_or_one`

---

temporary_directory/1

Temporary directory. Tries first environment variables: `TEMP` and `TMP` on Windows systems; `TMPDIR` on POSIX systems. When not defined, tries default locations. Returns the working directory as last resort.

Compilation flags:
`static`

Template:
`temporary_directory(Directory)`
Mode and number of proofs:
`temporary_directory(?atom)` - `one`

---

null_device_path/1

Null device path: `nul` on Windows systems and `/dev/null` on POSIX systems.

Compilation flags:
`static`

Template:
`null_device_path(Path)`
Mode and number of proofs:
`null_device_path(?atom)` - `one`

---

full_device_path/1

Full device path: `/dev/full` on Linux and BSD systems. Fails on other systems. Experimental.

Compilation flags:
`static`

Template:
`full_device_path(Path)`
Mode and number of proofs:
`full_device_path(?atom)` - `zero_or_one`

---

read_only_device_path/1

Read-only device path: `/dev/urandom` on macOS. Fails on other systems. Experimental.

Compilation flags:
`static`

Template:
`read_only_device_path(Path)`
Mode and number of proofs:
`read_only_device_path(?atom)` - `zero_or_one`

---

resolve_command_path/2

Resolves a command path given its name.

Compilation flags:
`static`

Template:
`resolve_command_path(Command,Path)`
Mode and number of proofs:
`resolve_command_path(+atom,-atom)` - `zero_or_one`

---

directory_files/2

Returns a list of all files (including directories, regular files, and hidden directories and files) in a directory. File paths are relative to the directory. Throws an error if the directory does not exist.

Compilation flags:
`static`

Template:
`directory_files(Directory,Files)`
Mode and number of proofs:
`directory_files(+atom,-list(atom))` - `one_or_error`

---

directory_files/3

Returns a list of files filtered using the given list of options. Invalid options are ignored. Default option values are equivalent to `directory_files/2`. Throws an error if the directory does not exist.

Compilation flags:

```
static
```

Template:

```
directory_files(Directory,Files,Options)
```

Mode and number of proofs:

```
directory_files(+atom,-list(atom),+list(compound)) - one_or_error
```

Remarks:

- Option `paths/1`: Possible values are `relative` and `absolute`. Default is `relative`.
- Option `type/1`: Possible values are `all`, `regular`, `directory`. Default is `all`.
- Option `extensions/1`: Argument is a list of required extensions (using the format `'.ext'`). Default is the empty list.
- Option `prefixes/1`: Argument is a list of required file prefixes (atoms). Default is the empty list.
- Option `suffixes/1`: Argument is a list of required file suffixes (atoms). Default is the empty list.
- Option `dot_files/1`: Possible values are `true` and `false`. Default is `true`.

---

directory_exists/1

True if the specified directory exists (irrespective of directory permissions).

Compilation flags:

```
static
```

Template:

```
directory_exists(Directory)
```

Mode and number of proofs:

```
directory_exists(+atom) - zero_or_one
```

---

ensure_directory/1

Ensures that a directory exists, creating it if necessary.

Compilation flags:

```
static
```

Template:

```
ensure_directory(Directory)
```

Mode and number of proofs:

```
ensure_directory(+atom) - one
```

---

file_exists/1

True if the specified file exists and is a regular file (irrespective of file permissions).

Compilation flags:
`static`

Template:
`file_exists(File)`
Mode and number of proofs:
`file_exists(+atom)` - `zero_or_one`

---

file_modification_time/2

File modification time (which can be used for comparison). Throws an error if the file does not exist.

Compilation flags:
`static`

Template:
`file_modification_time(File,Time)`
Mode and number of proofs:
`file_modification_time(+atom,-integer)` - `one_or_error`

---

file_size/2

File size (in bytes). Throws an error if the file does not exist.

Compilation flags:
`static`

Template:
`file_size(File,Size)`
Mode and number of proofs:
`file_size(+atom,-integer)` - `one_or_error`

---

file_permission/2

True iff the specified file has the specified permission (`read`, `write`, or `execute`). Throws an error if the file does not exist.

Compilation flags:

```
static
```

Template:

```
file_permission(File,Permission)
```

Mode and number of proofs:

```
file_permission(+atom,+atom) - zero_or_one_or_error
```

---

copy_file/2

Copies a file. Throws an error if the original file does not exist or if the copy cannot be created.

Compilation flags:

```
static
```

Template:

```
copy_file(File,Copy)
```

Mode and number of proofs:

```
copy_file(+atom,+atom) - one_or_error
```

---

rename_file/2

Renames a file or a directory. Throws an error if the file or directory does not exist.

Compilation flags:

```
static
```

Template:

```
rename_file(Old,New)
```

Mode and number of proofs:

```
rename_file(+atom,+atom) - one_or_error
```

---

delete_file/1

Deletes a file. Throws an error if the file does not exist.

Compilation flags:
`static`

Template:
`delete_file(File)`
Mode and number of proofs:
`delete_file(+atom)` - `one_or_error`

---

ensure_file/1

Ensures that a file exists, creating it if necessary.

Compilation flags:
`static`

Template:
`ensure_file(File)`
Mode and number of proofs:
`ensure_file(+atom)` - `one`

---

environment_variable/2

Returns an environment variable value. Fails if the variable does not exists.

Compilation flags:
`static`

Template:
`environment_variable(Variable,Value)`
Mode and number of proofs:
`environment_variable(+atom,?atom)` - `zero_or_one`

---

time_stamp/1

Returns a system-dependent time stamp, which can be used for sorting, but should be regarded otherwise as an opaque term.

Compilation flags:
`static`

Template:
`time_stamp(Time)`
Mode and number of proofs:
`time_stamp(-ground)` - `one`

---

date_time/7

Returns the current date and time. Note that most backends do not provide sub-second accuracy and in those cases the value of the `Milliseconds` argument is always zero.

Compilation flags:
`static`

Template:
`date_time(Year,Month,Day,Hours,Minutes,Seconds,Milliseconds)`
Mode and number of proofs:
`date_time(-integer,-integer,-integer,-integer,-integer,-integer,-integer)` - `one`

---

cpu_time/1

System cpu time in seconds. Accuracy depends on the backend.

Compilation flags:
`static`

Template:
`cpu_time(Seconds)`
Mode and number of proofs:
`cpu_time(-number)` - `one`

---

wall_time/1

Wall time in seconds. Accuracy depends on the backend.

Compilation flags:
`static`

Template:
`wall_time(Seconds)`
Mode and number of proofs:
`wall_time(-number)` - `one`

---

operating_system_type/1

Operating system type. Possible values are `unix`, `windows`, and `unknown`.

Compilation flags:
`static`

Template:
`operating_system_type(Type)`
Mode and number of proofs:
`operating_system_type(?atom)` - `zero_or_one`

---

operating_system_name/1

Operating system name. On POSIX systems, it returns the value of `uname -s`. On macOS systems, it returns `'Darwin'`. On Windows systems, it returns `'Windows'`.

Compilation flags:
`static`

Template:
`operating_system_name(Name)`
Mode and number of proofs:
`operating_system_name(?atom)` - `zero_or_one`

---

operating_system_machine/1

Operating system hardware platform. On POSIX systems, it returns the value of `uname -m`. On Windows systems, it returns the value of the `PROCESSOR_ARCHITECTURE` environment variable.

Compilation flags:
`static`

Template:
`operating_system_machine(Machine)`
Mode and number of proofs:
`operating_system_machine(?atom) - zero_or_one`

---

operating_system_release/1

Operating system release. On POSIX systems, it returns the value of `uname -r`. On Windows systems, it uses `WMI` code.

Compilation flags:
`static`

Template:
`operating_system_release(Release)`
Mode and number of proofs:
`operating_system_release(?atom) - zero_or_one`

---

command_line_arguments/1

Returns a list with the command line arguments that occur after `--`.

Compilation flags:
`static`

Template:
`command_line_arguments(Arguments)`
Mode and number of proofs:
`command_line_arguments(-list(atom)) - one`

`sleep/1`

Suspends execution the given number of seconds.

Compilation flags:
`static`

Template:
`sleep(Seconds)`
Mode and number of proofs:
`sleep(+number)` - `one`

  - *totp/5*
  - *hotp_verify/7*
  - *totp_verify/7*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

hotp/5

Computes an HOTP value for the given hash object, secret, moving counter, and number of digits. The secret can be either a raw byte list or a Base32 wrapper term of the form `base32(atom(Atom))`, `base32(chars(Chars))`, or `base32(codes(Codes))`.

Compilation flags:
`static`

Template:
`hotp(Hash,Secret,Counter,Digits,OTP)`

Mode and number of proofs:
`hotp(+object_identifier,+term,+integer,+integer,--atom)` - `one`

---

totp/5

Computes a TOTP value using the standard 30-second time step and Unix epoch `T0 = 0` for the given hash object, secret, Unix time, and number of digits.

Compilation flags:
`static`

Template:

`totp(Hash,Secret,UnixTime,Digits,OTP)`

Mode and number of proofs:

`totp(+object_identifier,+term,+integer,+integer,--atom)` - `one`

`hotp_verify/7`

Verifies an HOTP value by searching from the given counter through the bounded forward counter window. Returns the matched counter on success.

Compilation flags:

`static`

Template:

`hotp_verify(Hash,Secret,Counter,Window,Digits,OTP,MatchedCounter)`

Mode and number of proofs:

`hotp_verify(+object_identifier,+term,+integer,+integer,+integer,+atom,--integer)` - `zero_or_one_or_error`

Exceptions:

`Hash`, `Secret`, `Counter`, `Window`, `Digits`, or `OTP` is a variable or a partial list:

`instantiation_error`

`Hash` is not a supported OTP hash object:

`domain_error(otp_hash,Hash)`

`Secret` is neither a partial list nor a list:

`type_error(list,Secret)`

An element `Byte` of the *Secret*` list is neither a variable nor an integer:

`type_error(integer,Byte)`

An element `Byte` of the `Secret` list is an integer but not a valid byte:

`domain_error(byte,Byte)`

`Secret` is not a valid Base32 source:

`domain_error(base32_source,Secret)`

`Counter` or `Window` is neither a variable nor an integer:

`type_error(integer,Integer)`

`Counter` or `Window` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Integer)`

`Digits` is neither a variable nor an integer:

`type_error(integer,Digits)`

`Digits` is an integer but not a positive integer:

`domain_error(positive_integer,Digits)`

`OTP` neither a variable nor an atom:

`type_error(atom,OTP)`

`OTP` does not contain exactly `Digits` decimal digits:

`domain_error(otp_value,OTP)`

A searched counter exceeds the 64-bit HOTP moving-factor range:

`domain_error(otp_moving_factor,Counter)`

---

totp_verify/7

Verifies a TOTP value by searching within the bounded symmetric time-step window around the current time step. Returns the matched time step on success.

Compilation flags:

`static`

Template:

`totp_verify(Hash,Secret,UnixTime,Window,Digits,OTP,MatchedTimeStep)`

Mode and number of proofs:

`totp_verify(+object_identifier,+term,+integer,+integer,+integer,+atom,--integer)` - `zero_or_one_or_error`

Exceptions:

`Hash`, `Secret`, `UnixTime`, `Window`, `Digits`, or `OTP` is a variable or a partial list:

`instantiation_error`

`Hash` is not a supported OTP hash object:

`domain_error(otp_hash,Hash)`

`Secret` is neither a partial list nor a list:

`type_error(list,Secret)`

An element `Byte` of the *Secret*` list is neither a variable nor an integer:

`type_error(integer,Byte)`

An element `Byte` of the `Secret` list is an integer but not a valid byte:

`domain_error(byte,Byte)`

`Secret` is not a valid Base32 source:

`domain_error(base32_source,Secret)`

`UnixTime` or `Window` is neither a variable nor an integer:

`type_error(integer,Integer)`

`UnixTime` or `Window` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Integer)`

`Digits` is neither a variable nor an integer:

`type_error(integer,Digits)`

`Digits` is an integer but not a positive integer:

`domain_error(positive_integer,Digits)`

`OTP` is neither a variable nor an atom:

`type_error(atom,OTP)`

`OTP` does not contain exactly `Digits` decimal digits:

`domain_error(otp_value,OTP)`

A searched time step exceeds the 64-bit HOTP moving-factor range:

`domain_error(otp_moving_factor,TimeStep)`

  - *name/1*
  - *description/1*
  - *license/1*

    - *home/1*
    - *version/6*
    - *note/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

name/1

Pack name.

Compilation flags:
`static`

Template:
`name(Name)`
Mode and number of proofs:
`name(?atom)` - `zero_or_one`

---

description/1

Pack one line description.

Compilation flags:
`static`

Template:
`description(Description)`
Mode and number of proofs:
`description(?atom)` - `zero_or_one`

---

license/1

Pack license. Specified using the identifier from the SPDX License List (https://spdx.org/licenses/) when possible.

Compilation flags:
`static`

Template:
`license(License)`
Mode and number of proofs:
`license(?atom)` - `zero_or_one`

---

home/1

Pack home HTTPS or file URL.

Compilation flags:

```
static
```

Template:

```
home(Home)
```

Mode and number of proofs:

```
home(?atom) - zero_or_one
```

---

version/6

Table of available versions.

Compilation flags:

```
static
```

Template:

```
version(Version,Status,URL,Checksum,Dependencies,Portability)
```

Mode and number of proofs:

```
version(?compound,?atom,-atom,-pair(atom,atom),-list(pair(atom,callable)),?atom) -
zero_or_more
version(?compound,?atom,-atom,-pair(atom,atom),-list(pair(atom,callable)),
-list(atom)) - zero_or_more
```

Remarks:

- Version: This argument uses the same format as entity versions: `Major:Minor:Patch`. Semantic versioning should be used.
- Status: Version development status: `stable`, `rc`, `beta`, `alpha`, `experimental`, or `deprecated`.
- URL: File URL for a local directory, file URL for a local archive, download HTTPS URL for the pack archive, or download git archive URL for the pack archive.
- Checksum: A pair where the key is the hash algorithm and the value is the checksum. Currently, the hash algorithm must be `sha256`. For `file://` URLs of local directories, use `none` instead of a pair.
- Dependencies: Pack dependencies list. Each dependency is a `Dependency Operator Version` term. `Operator` is a term comparison operator. Valid `Dependency` values are `Registry::Pack`, `os(Name,Machine)`, `logtalk`, and a backend identifier atom.
- Portability: Either the atom `all` or a list of the supported backend Prolog compilers (using the identifier atoms used by the `prolog_dialect` flag).
- Clause order: Versions must be listed ordered from newest to oldest.

`note/3`

Table of notes per action and version.

Compilation flags:
`static`

Template:
`note(Action,Version,Note)`
Mode and number of proofs:
`note(?atom,?term,-atom)` - `zero_or_more`

Remarks:

- Action: Possible values are `install`, `update`, and `uninstall`. When unbound, the note apply to all actions.
- Version: Version being installed, updated, or uninstalled. When unbound, the note apply to all versions.
- Note: Note to print when performing an action on a pack version.

Public predicates

available/2

Enumerates, by backtracking, all available packs.

Compilation flags:
    `static`

Template:
    `available(Registry,Pack)`
Mode and number of proofs:
    `available(?atom,?atom)` - `zero_or_more`

Exceptions:
    `Registry` is neither a variable nor an atom:
        `type_error(atom,Registry)`
    `Pack` is neither a variable nor an atom:
        `type_error(atom,Pack)`

available/1

Lists all the packs that are available for installation from the given registry.

Compilation flags:
`static`

Template:
`available(Registry)`
Mode and number of proofs:
`available(+atom)` - `one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

---

available/0

Lists all the packs that are available for installation from all defined registries.

Compilation flags:
`static`

Mode and number of proofs:
`available` - `one`

---

installed/4

Enumerates by backtracking all installed packs.

Compilation flags:
`static`

Template:
`installed(Registry,Pack,Version,Pinned)`
Mode and number of proofs:
`installed(?atom,?atom,?compound,?boolean)` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

`Version` is neither a variable nor a compound term:
`type_error(compound,Version)`
`Pinned` is neither a variable nor a boolean:
`type_error(boolean,Pinned)`

`installed/3`

Enumerates by backtracking all installed packs.

Compilation flags:
`static`

Template:
`installed(Registry,Pack,Version)`
Mode and number of proofs:
`installed(?atom,?atom,?compound)` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Version` is neither a variable nor a compound term:
`type_error(compound,Version)`

`installed/1`

Lists all the packs that are installed from the given registry. Fails if the registry is unknown.

Compilation flags:
`static`

Template:
`installed(Registry)`
Mode and number of proofs:
`installed(+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

---

installed/0

Lists all the packs that are installed.

Compilation flags:
`static`

Mode and number of proofs:
`installed` - `one`

---

outdated/5

Enumerates by backtracking all installed but outdated packs (together with the current version installed and the latest version available) using the given options.

Compilation flags:
`static`

Template:
`outdated(Registry,Pack,Version,LatestVersion,Options)`

Mode and number of proofs:
`outdated(?atom,?atom,?compound,?compound,++list(compound))` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Version` is neither a variable nor a compound term:
`type_error(compound,Version)`
`LatestVersion` is neither a variable nor a compound term:
`type_error(compound,LatestVersion)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

Remarks:

- `compatible(Boolean)` option: Restrict listing to compatible packs. Default is `true`.
- `status(Status)` option: Restrict listing to updates with the given status. Default is `[stable,rc,beta,alpha]`. Set to `all` to also list `experimental` and `deprecated` updates.

---

outdated/4

Enumerates by backtracking all installed but outdated packs (together with the current version installed and the latest version available) using default options.

Compilation flags:
`static`

Template:
`outdated(Registry,Pack,Version,LatestVersion)`
Mode and number of proofs:
`outdated(?atom,?atom,?compound,?compound)` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Version` is neither a variable nor a compound term:
`type_error(compound,Version)`
`LatestVersion` is neither a variable nor a compound term:
`type_error(compound,LatestVersion)`

See also:
outdated/5

---

outdated/2

Lists all the packs from the given registry that are installed but outdated using the given options.

Compilation flags:
`static`

Template:
`outdated(Registry,Options)`
Mode and number of proofs:
`outdated(+atom,++list(compound))` - `one`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

Remarks:

- `compatible(Boolean)` option: Restrict installation to compatible packs. Default is `true`.
- `status(Status)` option: Restrict listing to updates with the given status. Default is `[stable,rc,beta,alpha]`. Set to `all` to also list `experimental` and `deprecated` updates.

---

outdated/1

Lists all the packs from the given registry that are installed but outdated using default options.

Compilation flags:
`static`

Template:
`outdated(Registry)`
Mode and number of proofs:
`outdated(+atom)` - `one`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

See also:
outdated/2

---

outdated/0

Lists all the packs that are installed but outdated using default options.

Compilation flags:
`static`

Mode and number of proofs:
`outdated` - `one`

See also:
outdated/1

---

orphaned/2

Lists all the packs that are installed but whose registry is no longer defined.

Compilation flags:
`static`

Template:
`orphaned(Registry,Pack)`
Mode and number of proofs:
`orphaned(?atom,?atom)` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

orphaned/0

Lists all the packs that are installed but whose registry is no longer defined.

Compilation flags:
`static`

Mode and number of proofs:
`orphaned` - `one`

---

versions/3

Returns a list of all available pack versions. Fails if the pack is unknown.

Compilation flags:
`static`

Template:
`versions(Registry,Pack,Versions)`
Mode and number of proofs:
`versions(+atom,+atom,-list)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

describe/2

Describes a registered pack, including installed version if applicable. Fails if the pack is unknown.

Compilation flags:
`static`

Template:
`describe(Registry,Pack)`
Mode and number of proofs:
`describe(+atom,+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

describe/1

Describes a registered pack, including installed version if applicable. Fails if the pack is unknown.

Compilation flags:
`static`

Template:
`describe(Pack)`
Mode and number of proofs:
`describe(+atom)` - `zero_or_one`

Exceptions:
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

pack_metadata/4

Enumerates by backtracking resolved metadata for installed packs.

Compilation flags:
`static`

Template:
`pack_metadata(Registry,Pack,Version,Metadata)`
Mode and number of proofs:
`pack_metadata(?atom,?atom,?compound,?compound)` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Version` is neither a variable nor a compound term:
`type_error(compound,Version)`
`Metadata` is neither a variable nor a compound term:
`type_error(compound,Metadata)`

Remarks:

- `Metadata`: Resolved metadata term for the selected installed pack version.
- Resolved fields: The metadata term includes both version-independent pack metadata and version-specific metadata selected from the installed version.
- Absent optional metadata: Missing optional metadata is normalized to `none` instead of causing failure.
- Metadata term: Metadata is returned using the term `metadata(Name, Description, License, Home, SourceURL, Checksum, Dependencies, Portability, Directory, Pinned, Installed, Loaded)`.

See also:
pack_property/4
pack_object/3
loaded_pack/3

---

pack_property/4

Enumerates by backtracking resolved properties for installed pack versions.

Compilation flags:
`static`

Template:
`pack_property(Registry,Pack,Version,Property)`
Mode and number of proofs:
`pack_property(?atom,?atom,?compound,?compound)` - `zero_or_more`

Exceptions:

`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`

`Pack` is neither a variable nor an atom:

`type_error(atom,Pack)`

`Version` is neither a variable nor a compound term:

`type_error(compound,Version)`

`Property` is neither a variable nor a compound term:

`type_error(compound,Property)`

Remarks:

- `Property`: A resolved property term for the selected installed pack version.
- Supported properties: Supported properties are `name(Name)`, `description(Description)`, `license(License)`, `home(Home)`, `source_url(URL)`, `checksum(Checksum)`, `dependencies(Dependencies)`, `portability(Portability)`, `directory(Directory)`, `pinned(Boolean)`, `installed(Boolean)`, and `loaded(Boolean)`.
- Absent optional metadata: Missing optional metadata is normalized to `none`.

See also:

pack_metadata/4
pack_object/3

---

pack_object/3

Enumerates by backtracking pack specification objects for defined registry and pack pairs.

Compilation flags:

`static`

Template:

`pack_object(Registry,Pack,PackObject)`

Mode and number of proofs:

`pack_object(?atom,?atom,?atom)` - `zero_or_more`

Exceptions:

`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`

`Pack` is neither a variable nor an atom:

`type_error(atom,Pack)`

`PackObject` is neither a variable nor an atom:

`type_error(atom,PackObject)`

Remarks:

- `PackObject`: Identifier of the object implementing the `pack_protocol` for the given registry and pack.
- Intended use: This predicate is a low-level bridge for advanced tools and should not be required by most consumers when `pack_metadata/4` or `pack_property/4` is sufficient.

See also:

pack_metadata/4
pack_property/4

---

loaded_pack/3

Enumerates by backtracking all installed packs that contributed loaded files to the current session.

Compilation flags:

`static`

Template:

`loaded_pack(Registry,Pack,Version)`

Mode and number of proofs:

`loaded_pack(?atom,?atom,?compound)` - `zero_or_more`

Exceptions:

`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`

`Pack` is neither a variable nor an atom:

`type_error(atom,Pack)`

`Version` is neither a variable nor a compound term:

`type_error(compound,Version)`

Remarks:

- Loaded pack: A pack is considered loaded iff at least one currently loaded file belongs to its installation directory.
- `Version`: Installed version of the loaded pack.

See also:

loaded_pack_file/4
pack_metadata/4
installed/3

---

loaded_pack_file/4

Enumerates by backtracking loaded files that belong to installed packs in the current session.

Compilation flags:

`static`

Template:

`loaded_pack_file(Registry,Pack,Version,File)`

Mode and number of proofs:

`loaded_pack_file(?atom,?atom,?compound,?atom)` - `zero_or_more`

Exceptions:

`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`

`Pack` is neither a variable nor an atom:

`type_error(atom,Pack)`

`Version` is neither a variable nor a compound term:

`type_error(compound,Version)`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

Remarks:

- `File`: Absolute path of a currently loaded file belonging to the selected installed pack.
- Intended use: This predicate supports diagnostics, tests, and the definition of `loaded_pack/3`.

See also:

loaded_pack/3

---

search/1

Searches packs whose name or description includes the search term (case sensitive).

Compilation flags:

`static`

Template:

`search(Term)`

Mode and number of proofs:

`search(+atom)` - `one`

Exceptions:

`Term` is a variable:

`instantiation_error`

`Term` is neither a variable nor an atom:

`type_error(atom,Term)`

---

pack_dependency/6

Enumerates by backtracking resolved direct pack-to-pack dependencies for installed pack versions.

Compilation flags:

`static`

Template:

```
pack_dependency(Registry,Pack,Version,DependencyRegistry,DependencyPack,
DependencyVersion)
```

Mode and number of proofs:

```
pack_dependency(?atom,?atom,?compound,?atom,?atom,?compound) - zero_or_more
```

Exceptions:

`Registry` is neither a variable nor an atom:

```
type_error(atom,Registry)
```

`Pack` is neither a variable nor an atom:

```
type_error(atom,Pack)
```

`Version` is neither a variable nor a compound term:

```
type_error(compound,Version)
```

`DependencyRegistry` is neither a variable nor an atom:

```
type_error(atom,DependencyRegistry)
```

`DependencyPack` is neither a variable nor an atom:

```
type_error(atom,DependencyPack)
```

`DependencyVersion` is neither a variable nor a compound term:

```
type_error(compound,DependencyVersion)
```

Remarks:

- Resolved dependency: Dependencies are resolved against the current installed packs using the same version comparison semantics used by the tool installation logic.
- Supported dependency forms: Version ranges, alternatives, and conjunctions are resolved using the canonical packs dependency semantics.
- Non-pack dependencies: Dependencies on Logtalk, Prolog backends, and operating systems are ignored by this predicate and therefore do not produce results.

See also:

loaded_pack_dependency/6
pack_metadata/4
loaded_pack/3

`loaded_pack_dependency/6`

Enumerates by backtracking resolved direct pack-to-pack dependencies where both the source pack and the dependency pack contributed loaded files to the current session.

Compilation flags:

```
static
```

Template:

```
loaded_pack_dependency(Registry,Pack,Version,DependencyRegistry,DependencyPack,
DependencyVersion)
```

Mode and number of proofs:

```
loaded_pack_dependency(?atom,?atom,?compound,?atom,?atom,?compound) - zero_or_more
```

Exceptions:

`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Version` is neither a variable nor a compound term:
`type_error(compound,Version)`
`DependencyRegistry` is neither a variable nor an atom:
`type_error(atom,DependencyRegistry)`
`DependencyPack` is neither a variable nor an atom:
`type_error(atom,DependencyPack)`
`DependencyVersion` is neither a variable nor a compound term:
`type_error(compound,DependencyVersion)`

Remarks:

- Loaded dependency edge: This predicate is the loaded-pack counterpart of `pack_dependency/6` and only succeeds when both endpoints are currently loaded.
- Intended use: This predicate is especially useful for tools that need to describe relationships between the installed packs that contributed code to the current session.

See also:
pack_dependency/6
loaded_pack/3

`install/4`

Installs a new pack using the specified options. Fails if the pack is unknown or already installed but not using `update(true)` or `force(true)` options. Fails also if the pack version is unknown.

Compilation flags:
`static`

Template:
`install(Registry,Pack,Version,Options)`
Mode and number of proofs:
`install(+atom,+atom,++compound,++list(compound))` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Version` is a variable:
`instantiation_error`

`Version` is neither a variable nor a valid version:
`type_error(pack_version,Version)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

Remarks:

- `update(Boolean)` option: Update pack if already installed. Default is `false`. Overrides the `force/1` option.
- `force(Boolean)` option: Force pack re-installation if already installed. Default is `false`.
- `compatible(Boolean)` option: Restrict installation to compatible packs. Default is `true`.
- `clean(Boolean)` option: Clean pack archive after installation. Default is `false`.
- `verbose(Boolean)` option: Verbose installing steps. Default is `false`.
- `checksum(Boolean)` option: Verify pack archive checksum. Default is `true`.
- `checksig(Boolean)` option: Verify pack archive signature. Default is `false`.
- `git(Atom)` option: Extra command-line options. Default is `''`.
- `downloader(Atom)` option: Downloader utility. Either `curl` or `wget`. Default is `curl`.
- `curl(Atom)` option: Extra command-line options. Default is `''`.
- `wget(Atom)` option: Extra command-line options. Default is `''`.
- `gpg(Atom)` option: Extra command-line options. Default is `''`.
- `tar(Atom)` option: Extra command-line options. Default is `''`.

`install/3`

Installs the specified version of a pack from the given registry using default options. Fails if the pack is already installed or unknown. Fails also if the pack version is unknown.

Compilation flags:
`static`

Template:
`install(Registry,Pack,Version)`
Mode and number of proofs:
`install(+atom,+atom,?compound)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is a variable:

`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Version` is a variable:
`instantiation_error`
`Version` is neither a variable nor a valid version:
`type_error(pack_version,Version)`

See also:
install/4

---

install/2

Installs the latest version of a pack from the given registry using default options. Fails if the pack is already installed or unknown.

Compilation flags:
`static`

Template:
`install(Registry,Pack)`
Mode and number of proofs:
`install(+atom,+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

See also:
install/3

---

install/1

Installs a pack (if its name is unique among all registries) using default options. Fails if the pack is already installed or unknown. Fails also if the pack is available from multiple registries.

Compilation flags:
`static`

Template:

`install(Pack)`

Mode and number of proofs:

`install(+atom)` - `zero_or_one`

Exceptions:

`Pack` is a variable:

`instantiation_error`

`Pack` is not an atom:

`type_error(atom,Pack)`

See also:

install/2

---

update/3

Updates an outdated pack to the specified version using the specified options. Fails if the pack or the pack version is unknown or if the pack is not installed. Fails also if the pack is orphaned or pinned and not using a `force(true)` option.

Compilation flags:

`static`

Template:

`update(Pack,Version,Options)`

Mode and number of proofs:

`update(+atom,++callable,++list(callable))` - `zero_or_one`

Exceptions:

`Pack` is a variable:

`instantiation_error`

`Pack` is neither a variable nor an atom:

`type_error(atom,Pack)`

`Version` is a variable:

`instantiation_error`

`Version` is neither a variable nor a valid version:

`type_error(pack_version,Version)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Remarks:

- `install(Boolean)` option: Install pack latest version if not already installed. Default is `false`.
- `force(Boolean)` option: Force update if the pack is pinned or breaks installed packs. Default is `false`.
- `compatible(Boolean)` option: Restrict updating to compatible packs. Default is `true`.
- `status(Status)` option: Specify allowed pack status. Default is `[stable,rc,beta,alpha]`. Set to `all` to also allow `experimental` and `deprecated`.
- `clean(Boolean)` option: Clean pack archive after updating. Default is `false`.
- `verbose(Boolean)` option: Verbose updating steps. Default is `false`.
- `checksum(Boolean)` option: Verify pack archive checksum. Default is `true`.
- `checksig(Boolean)` option: Verify pack archive signature. Default is `false`.
- `git(Atom)` option: Extra command-line options. Default is `''`.
- `downloader(Atom)` option: Downloader utility. Either `curl` or `wget`. Default is `curl`.
- `curl(Atom)` option: Extra command-line options. Default is `''`.
- `wget(Atom)` option: Extra command-line options. Default is `''`.
- `gpg(Atom)` option: Extra command-line options. Default is `''`.
- `tar(Atom)` option: Extra command-line options. Default is `''`.

---

update/2

Updates an outdated pack to its latest version using the specified options. Fails if the pack is orphaned, unknown, or not installed. Fails also if the pack is pinned and not using a `force(true)` option.

Compilation flags:

`static`

Template:

`update(Pack,Options)`

Mode and number of proofs:

`update(+atom,++list(callable))` - `zero_or_one`

Exceptions:

`Pack` is a variable:

`instantiation_error`

`Pack` is neither a variable nor an atom:

`type_error(atom,Pack)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Remarks:

- `install(Boolean)` option: Install pack latest version if not already installed. Default is `false`.

- `force(Boolean)` option: Force update if the pack is pinned or breaks installed packs. Default is `false`.
- `compatible(Boolean)` option: Restrict updating to compatible packs. Default is `true`.
- `status(Status)` option: Specify allowed pack update status. Default is `[stable,rc,beta,alpha]`. Set to `all` to also allow `experimental` and `deprecated`.
- `clean(Boolean)` option: Clean pack archive after updating. Default is `false`.
- `verbose(Boolean)` option: Verbose updating steps. Default is `false`.
- `checksum(Boolean)` option: Verify pack archive checksum. Default is `true`.
- `checksig(Boolean)` option: Verify pack archive signature. Default is `false`.
- `git(Atom)` option: Extra command-line options. Default is `''`.
- `downloader(Atom)` option: Downloader utility. Either `curl` or `wget`. Default is `curl`.
- `curl(Atom)` option: Extra command-line options. Default is `''`.
- `wget(Atom)` option: Extra command-line options. Default is `''`.
- `gpg(Atom)` option: Extra command-line options. Default is `''`.
- `tar(Atom)` option: Extra command-line options. Default is `''`.

---

update/1

Updates an outdated pack to its latest version using default options. Fails if the pack is pinned, orphaned, not installed, unknown, or breaks installed packs.

Compilation flags:

`static`

Template:

`update(Pack)`

Mode and number of proofs:

`update(+atom)` - `zero_or_one`

Exceptions:

`Pack` is a variable:

`instantiation_error`

`Pack` is neither a variable nor an atom:

`type_error(atom,Pack)`

See also:

update/2
update/3

---

update/0

Updates all outdated packs (that are not pinned) using default options.

Compilation flags:

`static`

Mode and number of proofs:

`update` - `zero_or_one`

`uninstall/2`

Uninstalls a pack using the specified options. Fails if the pack is unknown or not installed. Fails also if the pack is pinned or have dependents and not using a `force(true)` option.

Compilation flags:
`static`

Template:
`uninstall(Pack,Options)`
Mode and number of proofs:
`uninstall(+atom,++list(compound))` - `zero_or_one`

Exceptions:
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

Remarks:

- `force(Boolean)` option: Force deletion if the pack is pinned. Default is `false`.
- `clean(Boolean)` option: Clean pack archive after deleting. Default is `false`.
- `verbose(Boolean)` option: Verbose uninstalling steps. Default is `false`.

`uninstall/1`

Uninstalls a pack using default options. Fails if the pack is pinned, have dependents, not installed, or unknown.

Compilation flags:
`static`

Template:
`uninstall(Pack)`

Mode and number of proofs:
`uninstall(+atom)` - `zero_or_one`

Exceptions:
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

See also:
uninstall/2

---

uninstall/0

Uninstalls all packs using the `force(true)` option.

Compilation flags:
`static`

Mode and number of proofs:
`uninstall` - `zero_or_one`

---

clean/2

Cleans all pack archives. Fails if the the pack is unknown.

Compilation flags:
`static`

Template:
`clean(Registry,Pack)`
Mode and number of proofs:
`clean(+atom,+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

clean/1

Cleans all pack archives. Fails if the pack is unknown.

Compilation flags:
`static`

Template:
`clean(Pack)`
Mode and number of proofs:
`clean(+atom)` - `zero_or_one`

Exceptions:
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

See also:
clean/2

---

clean/0

Cleans all archives for all packs.

Compilation flags:
`static`

Mode and number of proofs:
`clean` - `one`

---

save/2

Saves a list of all installed packs and registries plus pinning status to a file using the given options.

Compilation flags:
`static`

Template:
`save(File,Options)`
Mode and number of proofs:
`save(+atom,++list(compound))` - `one_or_error`

Exceptions:
`File` is a variable:

`instantiation_error`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

`File` is an existing file but cannot be written:

`permission_error(open,source_sink,File)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Lock mode is requested with checksums disabled:

`consistency_error(compatible_options,lock(true),checksum(false))`

The setup cannot be represented by a complete lock file:

`domain_error(lock_setup,Reason)`

Remarks:

- `lock(Boolean)` option: Save complete version 1 lock facts for git registries and SHA-256 archive packs. Requires `checksum(true)` and a satisfiable locked dependency graph. Default is `false`.
- `save(What)` option: Save registries without installed packs when `What` is `all` and skip them when `What` is `installed`. Default is `installed`.

`save/1`

Saves a list of all installed packs and their registries plus pinning status to a file using default options.

Compilation flags:

`static`

Template:

`save(File)`

Mode and number of proofs:

`save(+atom)` - `one_or_error`

Exceptions:

`File` is a variable:

`instantiation_error`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

`File` is an existing file but cannot be written:

`permission_error(open,source_sink,File)`

See also:

save/2

restore/2

Restores a list of registries and packs plus their pinning status from a file using the given options. Fails if restoring is not possible.

Compilation flags:

`static`

Template:

`restore(File,Options)`

Mode and number of proofs:

`restore(+atom,++list(compound))` - `zero_or_one_or_error`

Exceptions:

`File` is a variable:

`instantiation_error`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

`File` is an atom but not an existing file:

`existence_error(file,File)`

`File` is an existing file but cannot be read:

`permission_error(open,source_sink,File)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Lock mode is requested with checksums disabled:

`consistency_error(compatible_options,lock(true),checksum(false))`

Remarks:

- `lock(Boolean)` option: Require complete version 1 lock facts, git registries, SHA-256 archive packs, and exact dependency versions. Requires `checksum(true)`. Restoring or verification failure is fatal; completed changes are not rolled back. Default is `false`.
- `force(Boolean)` option: Force restoring if a registry is already defined or a pack is already installed. Default is `true`.
- `compatible(Boolean)` option: Restrict installation to compatible packs. Default is `true`.
- `clean(Boolean)` option: Clean registry and pack archives after restoring. Default is `false`.
- `verbose(Boolean)` option: Verbose restoring steps. Default is `false`.
- `checksum(Boolean)` option: Verify pack archive checksums. Must be `true` in lock mode. Default is `true`.
- `checksig(Boolean)` option: Verify pack archive signatures. Default is `false`.
- `git(Atom)` option: Extra command-line options. Default is `''`.
- `downloader(Atom)` option: Downloader utility. Either `curl` or `wget`. Default is `curl`.

- `curl(Atom)` option: Extra command-line options. Default is `''`.
- `wget(Atom)` option: Extra command-line options. Default is `''`.
- `gpg(Atom)` option: Extra command-line options. Default is `''`.
- `tar(Atom)` option: Extra command-line options. Default is `''`.

`restore/1`

Restores a list of registries and packs plus their pinning status from a file using default options. Fails if restoring is not possible.

Compilation flags:
`static`

Template:
`restore(File)`
Mode and number of proofs:
`restore(+atom)` - `zero_or_one_or_error`

Exceptions:
`File` is a variable:
`instantiation_error`
`File` is neither a variable nor an atom:
`type_error(atom,File)`
`File` is an atom but not an existing file:
`existence_error(file,File)`
`File` is an existing file but cannot be read:
`permission_error(open,source_sink,File)`

See also:
restore/2

`dependents/3`

Returns a list of all installed packs that depend on the given pack from the given registry. Fails if the pack is unknown.

Compilation flags:
`static`

Template:
`dependents(Registry,Pack,Dependents)`
Mode and number of proofs:
`dependents(+atom,+atom,-list(atom))` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

dependents/2

Prints a list of all installed packs that depend on the given pack from the given registry. Fails if the pack is unknown.

Compilation flags:
`static`

Template:
`dependents(Registry,Pack)`
Mode and number of proofs:
`dependents(+atom,+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

dependents/1

Prints a list of all installed packs that depend on the given pack if unique from all defined registries. Fails if the pack is unknown or available from multiple registries.

Compilation flags:
`static`

Template:
`dependents(Pack)`
Mode and number of proofs:
`dependents(+atom)` - `zero_or_one`

Exceptions:
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:

```
type_error(atom,Pack)
```

---

lint/2

Checks the pack specification. Fails if the pack is unknown or if linting detects errors.

Compilation flags:
`static`

Template:
`lint(Registry,Pack)`
Mode and number of proofs:
`lint(+atom,+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

lint/1

Checks the pack specification. Fails if the pack is unknown, or available from multiple registries, or if linting detects errors.

Compilation flags:
`static`

Template:
`lint(Pack)`
Mode and number of proofs:
`lint(+atom)` - `zero_or_one`

Exceptions:
`Pack` is a variable:
`instantiation_error`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

lint/0

Checks all pack specifications.

Compilation flags:
`static`

Mode and number of proofs:
`lint` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

save_setup_terms/2

Collects the setup facts before opening the destination file.

Compilation flags:
`static`

Template:
`save_setup_terms(Options,Terms)`
Mode and number of proofs:
`save_setup_terms(+list(compound),-list(compound))` - `one_or_error`

Exceptions:
The setup cannot be represented by a complete lock file:
`domain_error(lock_setup,Reason)`

---

lock_registry_facts/3

Collects the URLs and full commits of all selected clean git registries.

Compilation flags:
`static`

Template:
`lock_registry_facts(Registries,Terms,Commits)`
Mode and number of proofs:
`lock_registry_facts(+list(atom),-list(compound),-list(compound))` - `one_or_error`

Exceptions:
A selected registry has no usable git commit or has tracked changes:

```
domain_error(lock_setup,registry(Registry))
```

---

lock_pack_facts/2

Collects the declared SHA-256 archive identities of all selected packs.

Compilation flags:
`static`

Template:
`lock_pack_facts(Packs,Terms)`
Mode and number of proofs:
`lock_pack_facts(+list(compound),-list(compound))` - `one_or_error`

Exceptions:
A selected pack has no usable SHA-256 archive identity:
`domain_error(lock_setup,pack(Registry,Pack,Version))`

---

check_lock_options/1

Checks that lock mode requires archive checksum verification.

Compilation flags:
`static`

Template:
`check_lock_options(Options)`
Mode and number of proofs:
`check_lock_options(+list(compound))` - `one_or_error`

Exceptions:
Lock mode is requested with checksums disabled:
`consistency_error(compatible_options,lock(true),checksum(false))`

Public predicates

setup/0

Ensures that registries and packs directory structure exists. Preserves any defined registries and installed packs.

Compilation flags:

`static`

Mode and number of proofs:

`setup` - `one`

---

reset/0

Resets registries and packs directory structure. Deletes any defined registries and installed packs.

Compilation flags:

`static`

Mode and number of proofs:

`reset` - `one`

---

verify_commands_availability/0

Verifies required shell commands availability. Fails printing an error message if a command is missing.

Compilation flags:
`static`

Mode and number of proofs:
`verify_commands_availability` - `zero_or_one`

---

help/0

Provides help about the main predicates.

Compilation flags:
`static`

Mode and number of proofs:
`help` - `one`

---

pin/1

Pins a resource (pack or registry) preventing it from being updated, uninstalled, or deleted. Fails if the resource is not found.

Compilation flags:
`static`

Template:
`pin(Resource)`
Mode and number of proofs:
`pin(+atom)` - `zero_or_one`

Exceptions:
`Resource` is a variable:
`instantiation_error`
`Resource` is neither a variable nor an atom:
`type_error(atom,Resource)`

---

pin/0

Pins all resource (packs or registries) preventing them from being updated, uninstalled, or deleted. Note that resources added after calling this predicate will not be pinned.

Compilation flags:
`static`

Mode and number of proofs:
`pin` - `one`

---

unpin/1

Unpins a resource (pack or registry), allowing it to be updated, uninstalled, or deleted. Fails if the resource is not found.

Compilation flags:
`static`

Template:
`unpin(Resource)`
Mode and number of proofs:
`unpin(+atom)` - `zero_or_one`

Exceptions:
`Resource` is a variable:
`instantiation_error`
`Resource` is neither a variable nor an atom:
`type_error(atom,Resource)`

---

unpin/0

Unpins all resources (packs or registries), allowing them to be updated, uninstalled, or deleted.

Compilation flags:
`static`

Mode and number of proofs:
`unpin` - `one`

---

pinned/1

True iff the resource (pack or registry) is defined or installed and if it is pinned.

Compilation flags:
`static`

Template:
`pinned(Resource)`
Mode and number of proofs:
`pinned(+atom)` - `zero_or_one`

Exceptions:
`Resource` is a variable:
`instantiation_error`
`Resource` is neither a variable nor an atom:
`type_error(atom,Resource)`

---

directory/2

Enumerates by backtracking all packs or registries and respective installation or definition directories (using the internal backend format).

Compilation flags:
`static`

Template:
`directory(Resource,Directory)`
Mode and number of proofs:
`directory(?atom,?atom)` - `zero_or_more`

Exceptions:
`Resource` is neither a variable nor an atom:
`type_error(atom,Resource)`
`Directory` is neither a variable nor an atom:
`type_error(atom,Directory)`

---

directory/1

Prints the directory where the registry or the pack is installed (using the native operating-system format).

Compilation flags:
`static`

Template:

```
directory(Resource)
```

Mode and number of proofs:

```
directory(+atom) - zero_or_one
```

Exceptions:

`Resource` is a variable:

```
instantiation_error
```

`Resource` is neither a variable nor an atom:

```
type_error(atom,Resource)
```

---

readme/2

Returns the path to the resource (pack or registry) readme file (using the internal backend format). Fails if the resource is not defined or installed or if no readme file is found for it.

Compilation flags:

```
static
```

Template:

```
readme(Resource,ReadMeFile)
```

Mode and number of proofs:

```
readme(+atom,-atom) - zero_or_one
```

Exceptions:

`Resource` is a variable:

```
instantiation_error
```

`Resource` is neither a variable nor an atom:

```
type_error(atom,Resource)
```

`ReadMeFile` is neither a variable nor an atom:

```
type_error(atom,ReadMeFile)
```

---

readme/1

Prints the path to the resource (pack or registry) readme file (using the native operating-system format). Fails if the resource is not defined or installed or if no readme file is found for it.

Compilation flags:

```
static
```

Template:

```
readme(Resource)
```

Mode and number of proofs:

```
readme(+atom) - zero_or_one
```

Exceptions:

`Resource` is a variable:
`instantiation_error`
`Resource` is neither a variable nor an atom:
`type_error(atom,Resource)`

`logtalk_packs/1`

Returns the directory prefix (using the internal backend format) where the registries, packs, and archives are installed.

Compilation flags:
`static`

Template:
`logtalk_packs(LogtalkPacks)`
Mode and number of proofs:
`logtalk_packs(-atom)` - `one`

Exceptions:
`LogtalkPacks` is neither a variable nor an atom:
`type_error(atom,LogtalkPacks)`

`logtalk_packs/0`

Prints the directory prefix (using the native operating-system format) where the registries, packs, and archives are installed.

Compilation flags:
`static`

Mode and number of proofs:
`logtalk_packs` - `one`

`prefix/1`

Returns the directory prefix (using the internal backend format) where the registries or packs are installed.

Compilation flags:
`static`

Template:
`prefix(Prefix)`
Mode and number of proofs:
`prefix(-atom)` - `one`

Exceptions:

`Prefix` is neither a variable nor an atom:

`type_error(atom,Prefix)`

`prefix/0`

Prints the directory prefix (using the native operating-system format) where the registries or packs are installed.

Compilation flags:

`static`

Mode and number of proofs:

`prefix` - `one`

Protected predicates

`readme_file_path/2`

Returns the absolute path for the given directory readme file if it exists.

Compilation flags:

`static`

Template:

`readme_file_path(Directory,ReadMeFile)`

Mode and number of proofs:

`readme_file_path(+atom,-atom)` - `zero_or_one`

Remarks:

- Valid file names: Case variations of `README` and `NOTES` with or without a `.md` or `.txt` extension. The recommended file name is `README.md`.

`print_readme_file_path/1`

Prints the absolute path for the given directory readme file if it exists. Succeeds otherwise.

Compilation flags:

`static`

Template:

`print_readme_file_path(Directory)`

Mode and number of proofs:

`print_readme_file_path(+atom)` - `one`

---

command/2

Executes a shell command. Prints an error message and fails if the command fails.

Compilation flags:

```
static
```

Template:

```
command(Command,FailureMessage)
```

Mode and number of proofs:

```
command(+atom,@nonvar) - zero_or_one
```

---

load_registry/1

Loads all registry files from the given directory.

Compilation flags:

```
static
```

Template:

```
load_registry(Directory)
```

Mode and number of proofs:

```
load_registry(+atom) - zero_or_one
```

---

sha256sum_command/1

Returns the name of the sha256sum command to be used on POSIX systems. Fails if neither gsha256sum or sha256sum commands are found.

Compilation flags:

```
static
```

Template:

```
sha256sum_command(Command)
```

Mode and number of proofs:

```
sha256sum_command(-atom) - zero_or_one
```

---

tar_command/1

Returns the name of the tar command to be used depending on the operating-system.

Compilation flags:
`static`

Template:
`tar_command(Command)`
Mode and number of proofs:
`tar_command(-atom)` - `one`

---

supported_archive/1

True iff the archive format is supported.

Compilation flags:
`static`

Template:
`supported_archive(Extension)`
Mode and number of proofs:
`supported_archive(+atom)` - `zero_or_one`

---

supported_url_archive/1

True iff the URL archive is supported.

Compilation flags:
`static`

Template:
`supported_url_archive(URL)`
Mode and number of proofs:
`supported_url_archive(+atom)` - `zero_or_one`

`decode_url_spaces/2`

Decodes encoded spaces (%20) in URLs to spaces.

Compilation flags:
`static`

Template:
`decode_url_spaces(URL,Decoded)`
Mode and number of proofs:
`decode_url_spaces(+atom,-atom) - one`

Public predicates

list/0

Prints a list of all defined registries, including how defined (`git`, `archive`, or `directory`) and if they are pinned.

Compilation flags:

`static`

Mode and number of proofs:

`list` - `one`

describe/1

Prints all registry entries.

Compilation flags:
`static`

Template:
`describe(Registry)`
Mode and number of proofs:
`describe(+atom)` - `one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

---

defined/4

Enumerates by backtracking all defined registries, their definition URL, how they are defined (`git`, `archive`, or `directory`), and if they are pinned.

Compilation flags:
`static`

Template:
`defined(Registry,URL,HowDefined,Pinned)`
Mode and number of proofs:
`defined(?atom,?atom,?atom,?boolean)` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`URL` is neither a variable nor an atom:
`type_error(atom,URL)`
`HowDefined` is neither a variable nor an atom:
`type_error(atom,HowDefined)`
`Pinned` is neither a variable nor a boolean:
`type_error(boolean,Pinned)`

---

add/3

Adds a new registry using the given options. Fails if the registry cannot be added or if it is already defined but not using `update(true)` or `force(true)` options. A `file://` URL can be used for a local directory or archive.

Compilation flags:

`static`

Template:

`add(Registry,URL,Options)`

Mode and number of proofs:

`add(+atom,+atom,++list(compound))` - `zero_or_one`

Exceptions:

`Registry` is a variable:

`instantiation_error`

`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`

`URL` is a variable:

`instantiation_error`

`URL` is neither a variable nor an atom:

`type_error(atom,URL)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Remarks:

- Registry name: Must be the URL basename when using a git URL or a local directory URL. Must also be the declared registry name in the registry specification object.
- HTTPS URLs: Must end with either a `.git` extension or an archive extension.
- `commit(Hash)` option: When present, checkout the registry git repository at the specified commit hash after cloning.
- `update(Boolean)` option: Update registry if already defined. Default is `false`. Overrides the `force/1` option.
- `force(Boolean)` option: Force registry re-installation if already defined by first deleting the previous installation. Default is `false`.
- `clean(Boolean)` option: Clean registry archive after updating. Default is `false`.
- `verbose(Boolean)` option: Verbose adding steps. Default is `false`.
- `downloader(Atom)` option: Downloader utility. Either `curl` or `wget`. Default is `curl`.
- `curl(Atom)` option: Extra command-line options. Default is `''`.
- `wget(Atom)` option: Extra command-line options. Default is `''`.
- `gpg(Atom)` option: Extra command-line options. Default is `''`.
- `tar(Atom)` option: Extra command-line options. Default is `''`.

add/2

Adds a new registry using default options. Fails if the registry cannot be added or if it is already defined. HTTPS URLs must end with either a `.git` extension or an archive extension. A `file://` URL can be used for a local directory or archive.

Compilation flags:
`static`

Template:
`add(Registry,URL)`
Mode and number of proofs:
`add(+atom,+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`URL` is a variable:
`instantiation_error`
`URL` is neither a variable nor an atom:
`type_error(atom,URL)`

Remarks:

- Registry name: Must be the URL basename when using a git URL or a local directory URL. Must also be the declared registry name in the registry specification object.

See also:
add/3

---

add/1

Adds a new registry using default options. Fails if the registry cannot be added or if it is already defined. HTTPS URLs must end with a `.git` extension or an archive extension. A `file://` URL can be used for a local directory or archive.

Compilation flags:
`static`

Template:
`add(URL)`
Mode and number of proofs:
`add(+atom)` - `zero_or_one`

Exceptions:
`URL` is a variable:
`instantiation_error`
`URL` is neither a variable nor an atom:

`type_error(atom,URL)`

Remarks:

- Registry name: Taken from the URL basename.

See also:
add/2

---

update/2

Updates a defined registry using the specified options. Fails if the registry is not defined.

Compilation flags:
`static`

Template:
`update(Registry,Options)`
Mode and number of proofs:
`update(+atom,++list(compound))` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

Remarks:

- `commit(Hash)` option: When present, checkout the registry git repository at the specified commit hash after updating.
- `force(Boolean)` option: Force update if the registry is pinned. Default is `false`.
- `clean(Boolean)` option: Clean registry archive after updating. Default is `false`.
- `verbose(Boolean)` option: Verbose updating steps. Default is `false`.
- `downloader(Atom)` option: Downloader utility. Either `curl` or `wget`. Default is `curl`.
- `curl(Atom)` option: Extra command-line options. Default is `''`.
- `wget(Atom)` option: Extra command-line options. Default is `''`.
- `gpg(Atom)` option: Extra command-line options. Default is `''`.
- `tar(Atom)` option: Extra command-line options. Default is `''`.

---

update/1

Updates a defined registry using default options. Fails if the registry is not defined.

Compilation flags:
`static`

Template:
`update(Registry)`
Mode and number of proofs:
`update(+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

See also:
update/2

---

update/0

Updates all defined registries using default options.

Compilation flags:
`static`

Mode and number of proofs:
`update` - `zero_or_one`

---

delete/2

Deletes a registry using the specified options (if not pinned).

Compilation flags:
`static`

Template:
`delete(Registry,Options)`
Mode and number of proofs:
`delete(+atom,++list(compound))` - `zero_or_one`

Exceptions:
`Registry` is a variable:

`instantiation_error`

`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Remarks:

- `force(Boolean)` option: Force deletion if the registry is pinned or there are installed registry packs. Default is `false`.
- `clean(Boolean)` option: Clean registry archive after deleting. Default is `false`.
- `verbose(Boolean)` option: Verbose deleting steps. Default is `false`.
- `downloader(Atom)` option: Downloader utility. Either `curl` or `wget`. Default is `curl`.
- `curl(Atom)` option: Extra command-line options. Default is `''`.
- `wget(Atom)` option: Extra command-line options. Default is `''`.
- `gpg(Atom)` option: Extra command-line options. Default is `''`.
- `tar(Atom)` option: Extra command-line options. Default is `''`.

`delete/1`

Deletes a registry using default options.

Compilation flags:

`static`

Template:

`delete(Registry)`

Mode and number of proofs:

`delete(+atom)` - `zero_or_one`

Exceptions:

`Registry` is a variable:

`instantiation_error`

`Registry` is neither a variable nor an atom:

`type_error(atom,Registry)`

See also:

delete/2

---

delete/0

Deletes all registries using the `force(true)` option.

Compilation flags:
`static`

Mode and number of proofs:
`delete` - `zero_or_one`

---

clean/1

Cleans all registry archives. Fails if the registry is not defined.

Compilation flags:
`static`

Template:
`clean(Registry)`
Mode and number of proofs:
`clean(+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

---

clean/0

Cleans all archives for all registries.

Compilation flags:
`static`

Mode and number of proofs:
`clean` - `one`

---

provides/2

Enumerates by backtracking all packs provided by a registry.

Compilation flags:
`static`

Template:
`provides(Registry,Pack)`
Mode and number of proofs:
`provides(?atom,?atom)` - `zero_or_more`

Exceptions:
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`
`Pack` is neither a variable nor an atom:
`type_error(atom,Pack)`

---

lint/1

Checks the registry specification. Fails if the registry is not defined or if linting detects errors.

Compilation flags:
`static`

Template:
`lint(Registry)`
Mode and number of proofs:
`lint(+atom)` - `zero_or_one`

Exceptions:
`Registry` is a variable:
`instantiation_error`
`Registry` is neither a variable nor an atom:
`type_error(atom,Registry)`

---

lint/0

Checks all registry specifications.

Compilation flags:
`static`

Mode and number of proofs:
`lint` - `one`

Public predicates

name/1

Registry name. Preferably a valid unquoted atom.

Compilation flags:
`static`

Template:
`name(Name)`
Mode and number of proofs:
`name(?atom)` - `zero_or_one`

---

description/1

Registry one line description.

Compilation flags:
`static`

Template:
`description(Description)`
Mode and number of proofs:
`description(?atom)` - `zero_or_one`

---

home/1

Registry home HTTPS or file URL.

Compilation flags:
`static`

Template:
`home(Home)`
Mode and number of proofs:
`home(?atom)` - `zero_or_one`

---

clone/1

Registry git clone HTTPS URL (must end with the `.git` extension). Git repos should have the same name as the registry.

Compilation flags:
`static`

Template:
`clone(URL)`
Mode and number of proofs:
`clone(?atom)` - `zero_or_one`

---

archive/1

Registry archive download HTTPS URL.

Compilation flags:
`static`

Template:
`archive(URL)`
Mode and number of proofs:
`archive(?atom)` - `zero_or_one`

---

note/2

Table of notes per action.

Compilation flags:
`static`

Template:
`note(Action,Note)`
Mode and number of proofs:
`note(?atom,-atom)` - `zero_or_more`

Remarks:

- Action: Possible values are `add`, `update`, and `delete`. When unbound, the note apply to all actions.
- Note: Note to print when performing an action on a registry.

particle_swarm_optimization(Problem,Random), *particle_swarm_optimization_protocol*

object

1.250.2 `particle_swarm_optimization(Problem,Random)`

- `Problem` - Problem object implementing `particle_swarm_optimization_protocol`.
- `Random` - Random number generator object providing `between/3`, `random/1`, and `randomize/1` predicates.

Continuous bounded global-best particle swarm optimization algorithm. Parameterized by a problem object implementing the `particle_swarm_optimization_protocol` protocol and by a random number generator algorithm for the `fast_random` library. The algorithm minimizes or maximizes the fitness function defined by the problem.

Availability:

```
logtalk_load(particle_swarm_optimization(loader))
```

Author: Paulo Moura
Version: 2:0:0
Date: 2026-11-19

Compilation flags:

```
static, context_switching_calls
```

Imports:

`public` *options*

Uses:

linear_algebra
numberlist
type

Remarks:

- Algorithm: Uses synchronous global-best particle swarm optimization. Every particle update in an iteration uses the global best from the start of that iteration.
- Optimization objective: The `objective(minimize|maximize)` option selects the fitness ordering. Fitness values are otherwise used unchanged.

- Target fitness: The `target_fitness(Fitness)` option stops the run when the best fitness reaches or passes the target in the selected objective direction.
- Stagnation stopping: The `stagnation_iterations(N)` option stops the run after `N` consecutive iterations without a strict global-best improvement; zero disables this condition.
- Initial velocities: If the problem defines `initial_velocities/1`, its velocities are validated and used. Otherwise, velocities are sampled randomly.
- Boundary handling: Velocities are limited to plus or minus the range of each dimension. A position crossing a bound is clamped to that bound and its velocity component is set to zero.
- Progress reporting: If the problem object defines `progress/5`, it is called periodically and once when the loop terminates.
- Seed control: The `seed(S)` option initializes the random number generator for reproducible runs.

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*

  - *run/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

run/2

Runs the particle swarm optimization algorithm using default options and returns the best position and fitness found.

Compilation flags:

`static`

Template:

`run(BestPosition,BestFitness)`

Mode and number of proofs:

`run(-list(number),-number)` - `one`

---

run/3

Runs the particle swarm optimization algorithm using the given options and returns the best position and fitness found.

Compilation flags:

`static`

Template:

`run(BestPosition,BestFitness,Options)`

Mode and number of proofs:

`run(-list(number),-number,+list(compound))` - `one`

Remarks:

- `objective(Objective)` option: Optimization objective, either `minimize` or `maximize` (default: `minimize`).
- `target_fitness(Fitness)` option: Numeric target that stops the run when reached or passed in the selected objective direction (default: `none`).
- `max_iterations(N)` option: Maximum number of swarm iterations (default: `1000`).
- `stagnation_iterations(N)` option: Number of consecutive iterations without a strict global-best improvement before stopping; zero disables this condition (default: `0`).
- `inertia_weight(W)` option: Velocity inertia weight (default: `0.7298`).
- `cognitive_coefficient(C)` option: Personal-best acceleration coefficient (default: `1.49618`).
- `social_coefficient(C)` option: Global-best acceleration coefficient (default: `1.49618`).
- `updates(N)` option: Number of progress reports during the run; zero disables reporting (default: `0`).
- `seed(S)` option: Positive integer random seed for reproducible runs.

`run/4`

Runs the particle swarm optimization algorithm using the given options and returns the best position, best fitness, and run statistics.

Compilation flags:

`static`

Template:

`run(BestPosition,BestFitness,Statistics,Options)`

Mode and number of proofs:

`run(-list(number),-number,-list(compound),+list(compound))` - `one`

Remarks:

- Statistics list: A list containing `iterations(N)`, `evaluations(E)`, `improvements(I)`, `final_mean_fitness(M)`, and `final_diversity(D)`. Improvements are measured in the selected objective direction.

Protected predicates

- *Public predicates*
  - *initial_positions/1*
  - *position_bounds/1*
  - *initial_velocities/1*
  - *fitness/2*
  - *stop_condition/3*
  - *progress/5*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

initial_positions/1

Returns a non-empty list of initial particle positions. All positions must be non-empty lists of numbers with the same dimensions as the position bounds.

Compilation flags:
`static`

Template:
`initial_positions(Positions)`
Mode and number of proofs:
`initial_positions(-list(list(number)))` - `one`

---

position_bounds/1

Returns one `Lower-Upper` numeric bound pair per position dimension, with `Lower =< Upper`.

Compilation flags:
`static`

Template:
`position_bounds(Bounds)`
Mode and number of proofs:
`position_bounds(-list(pair))` - `one`

---

initial_velocities/1

Returns one initial velocity vector per initial position. Each vector must have the same dimensions as the position bounds, with every component between plus or minus the corresponding position range. Optional. When not defined or when it fails, velocities are initialized randomly.

Compilation flags:
`static`

Template:
`initial_velocities(Velocities)`
Mode and number of proofs:
`initial_velocities(-list(list(number)))` - `zero_or_one`

---

fitness/2

Computes the fitness of a particle position. The optimization direction is selected using the optimizer `objective/1` option.

Compilation flags:

```
static
```

Template:

```
fitness(Position,Fitness)
```

Mode and number of proofs:

```
fitness(+list(number),-number) - one
```

---

stop_condition/3

True when the search should stop given the completed iteration count, best position, and best fitness. Optional. When not defined, the search runs for the configured maximum number of iterations.

Compilation flags:

```
static
```

Template:

```
stop_condition(Iteration,BestPosition,BestFitness)
```

Mode and number of proofs:

```
stop_condition(+non_negative_integer,+list(number),+number) - zero_or_one
```

---

progress/5

Called periodically to report the completed iteration count, best position, best fitness, mean swarm fitness, and swarm diversity. Diversity is the mean Euclidean distance from the swarm centroid. Optional.

Compilation flags:

```
static
```

Template:

```
progress(Iteration,BestPosition,BestFitness,MeanFitness,Diversity)
```

Mode and number of proofs:

```
progress(+non_negative_integer,+list(number),+number,+number,+number) -
zero_or_one
```

Public predicates

partitions/2

Generates all set partitions of a list using default order. Partitions are represented as lists of non-empty blocks. The empty list has one partition, represented by the empty list of blocks.

Compilation flags:
`static`

Template:
`partitions(List,Partitions)`
Mode and number of proofs:
`partitions(+list,-list)` - `one`

---

partition/2

True iff the second argument is a set partition of a list using default order.

Compilation flags:
`static`

Template:
`partition(List,Partition)`
Mode and number of proofs:
`partition(+list,-list)` - `one_or_more`

---

partitions/3

Generates either all set partitions with the given order (when the second argument is `default` or `lexicographic`) or all set partitions with an exact number of blocks using default order (when the first argument is an integer).

Compilation flags:
`static`

Template:
`partitions(ListOrK,OrderOrList,Partitions)`
Mode and number of proofs:
`partitions(+list,+atom,-list)` - `one`
`partitions(+integer,+list,-list)` - `one`

---

partition/3

True iff the third argument is a set partition generated either in the given order or with the given exact number of blocks using default order.

Compilation flags:
`static`

Template:
`partition(ListOrK,OrderOrList,Partition)`
Mode and number of proofs:
`partition(+list,+atom,-list)` - `one_or_more`
`partition(+integer,+list,-list)` - `one_or_more`

---

partitions/4

Generates all set partitions with an exact number of blocks and the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`partitions(K,List,Order,Partitions)`
Mode and number of proofs:
`partitions(+integer,+list,+atom,-list)` - `one`

---

partition/4

True iff the fourth argument is a set partition with an exact number of blocks and the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`partition(K,List,Order,Partition)`
Mode and number of proofs:
`partition(+integer,+list,+atom,-list)` - `one_or_more`

---

distinct_partitions/2

Generates all distinct set partitions of a list (deduplicating equal-valued partitions after canonicalizing block order) using default order.

Compilation flags:
`static`

Template:
`distinct_partitions(List,Partitions)`
Mode and number of proofs:
`distinct_partitions(+list,-list)` - `one`

---

distinct_partition/2

True iff the second argument is a distinct set partition of a list using default order.

Compilation flags:
`static`

Template:
`distinct_partition(List,Partition)`
Mode and number of proofs:
`distinct_partition(+list,-list)` - `one_or_more`

---

distinct_partitions/3

Generates either all distinct set partitions with the given order (when the second argument is `default` or `lexicographic`) or all distinct set partitions with an exact number of blocks using default order (when the first argument is an integer).

Compilation flags:
`static`

Template:
`distinct_partitions(ListOrK,OrderOrList,Partitions)`
Mode and number of proofs:
`distinct_partitions(+list,+atom,-list)` - `one`
`distinct_partitions(+integer,+list,-list)` - `one`

---

distinct_partition/3

True iff the third argument is a distinct set partition generated either in the given order or with the given exact number of blocks using default order.

Compilation flags:
`static`

Template:
`distinct_partition(ListOrK,OrderOrList,Partition)`
Mode and number of proofs:
`distinct_partition(+list,+atom,-list)` - `one_or_more`
`distinct_partition(+integer,+list,-list)` - `one_or_more`

---

distinct_partitions/4

Generates all distinct set partitions with an exact number of blocks and the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`distinct_partitions(K,List,Order,Partitions)`
Mode and number of proofs:
`distinct_partitions(+integer,+list,+atom,-list)` - `one`

---

distinct_partition/4

True iff the fourth argument is a distinct set partition with an exact number of blocks and the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`distinct_partition(K,List,Order,Partition)`
Mode and number of proofs:
`distinct_partition(+integer,+list,+atom,-list)` - `one_or_more`

---

count_partitions/2

Counts the number of set partitions of a list.

Compilation flags:
`static`

Template:
`count_partitions(List,Count)`
Mode and number of proofs:
`count_partitions(+list,-integer)` - `one`

---

nth_partition/3

Returns the set partition at a given zero-based index using default order.

Compilation flags:
`static`

Template:
`nth_partition(List,Index,Partition)`
Mode and number of proofs:
`nth_partition(+list,+integer,-list)` - `zero_or_one`

---

nth_partition/4

Returns either the set partition at a given zero-based index in the given order (when the second argument is `default` or `lexicographic`) or the set partition with an exact number of blocks at a given zero-based index using default order (when the first argument is an integer).

Compilation flags:
`static`

Template:
`nth_partition(ListOrK,OrderOrList,Index,Partition)`
Mode and number of proofs:
`nth_partition(+list,+atom,+integer,-list)` - `zero_or_one`
`nth_partition(+integer,+list,+integer,-list)` - `zero_or_one`

---

nth_partition/5

Returns the set partition with an exact number of blocks at a given zero-based index in the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`nth_partition(K,List,Order,Index,Partition)`
Mode and number of proofs:
`nth_partition(+integer,+list,+atom,+integer,-list)` - `zero_or_one`

---

partition_index/3

Returns the zero-based index of a set partition using default order.

Compilation flags:
`static`

Template:
`partition_index(List,Partition,Index)`
Mode and number of proofs:
`partition_index(+list,+list,-integer)` - `zero_or_one`

---

partition_index/4

Returns either the zero-based index of a set partition in the given order (when the second argument is `default` or `lexicographic`) or the zero-based index of a set partition with an exact number of blocks using default order (when the first argument is an integer).

Compilation flags:
`static`

Template:
`partition_index(ListOrK,OrderOrList,Partition,Index)`
Mode and number of proofs:
`partition_index(+list,+atom,+list,-integer)` - `zero_or_one`
`partition_index(+integer,+list,+list,-integer)` - `zero_or_one`

---

partition_index/5

Returns the zero-based index of a set partition with an exact number of blocks in the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`partition_index(K,List,Order,Partition,Index)`
Mode and number of proofs:
`partition_index(+integer,+list,+atom,+list,-integer)` - `zero_or_one`

---

count_partitions/3

Counts the number of set partitions of a list with an exact number of blocks.

Compilation flags:
`static`

Template:
`count_partitions(K,List,Count)`
Mode and number of proofs:
`count_partitions(+integer,+list,-integer)` - `zero_or_one`

---

count_distinct_partitions/2

Counts the number of distinct set partitions of a list (deduplicating equal-valued partitions).

Compilation flags:
`static`

Template:
`count_distinct_partitions(List,Count)`
Mode and number of proofs:
`count_distinct_partitions(+list,-integer)` - `one`

---

nth_distinct_partition/3

Returns the distinct set partition at a given zero-based index using default order.

Compilation flags:
`static`

Template:
`nth_distinct_partition(List,Index,Partition)`
Mode and number of proofs:
`nth_distinct_partition(+list,+integer,-list)` - `zero_or_one`

---

nth_distinct_partition/4

Returns either the distinct set partition at a given zero-based index in the given order (when the second argument is `default` or `lexicographic`) or the distinct set partition with an exact number of blocks at a given zero-based index using default order (when the first argument is an integer).

Compilation flags:
`static`

Template:
`nth_distinct_partition(ListOrK,OrderOrList,Index,Partition)`
Mode and number of proofs:
`nth_distinct_partition(+list,+atom,+integer,-list)` - `zero_or_one`
`nth_distinct_partition(+integer,+list,+integer,-list)` - `zero_or_one`

---

nth_distinct_partition/5

Returns the distinct set partition with an exact number of blocks at a given zero-based index in the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`nth_distinct_partition(K,List,Order,Index,Partition)`
Mode and number of proofs:
`nth_distinct_partition(+integer,+list,+atom,+integer,-list)` - `zero_or_one`

---

distinct_partition_index/3

Returns the zero-based index of a distinct set partition using default order.

Compilation flags:
`static`

Template:
`distinct_partition_index(List,Partition,Index)`
Mode and number of proofs:
`distinct_partition_index(+list,+list,-integer)` - `zero_or_one`

---

distinct_partition_index/4

Returns either the zero-based index of a distinct set partition in the given order (when the second argument is `default` or `lexicographic`) or the zero-based index of a distinct set partition with an exact number of blocks using default order (when the first argument is an integer).

Compilation flags:
`static`

Template:
`distinct_partition_index(ListOrK,OrderOrList,Partition,Index)`
Mode and number of proofs:
`distinct_partition_index(+list,+atom,+list,-integer)` - `zero_or_one`
`distinct_partition_index(+integer,+list,+list,-integer)` - `zero_or_one`

---

distinct_partition_index/5

Returns the zero-based index of a distinct set partition with an exact number of blocks in the given order: `default` or `lexicographic`.

Compilation flags:
`static`

Template:
`distinct_partition_index(K,List,Order,Partition,Index)`
Mode and number of proofs:
`distinct_partition_index(+integer,+list,+atom,+list,-integer)` - `zero_or_one`

---

count_distinct_partitions/3

Counts the number of distinct set partitions of a list with an exact number of blocks.

Compilation flags:
`static`

Template:
`count_distinct_partitions(K,List,Count)`
Mode and number of proofs:
`count_distinct_partitions(+integer,+list,-integer)` - `zero_or_one`

---

random_partition/2

Returns a random set partition of a list.

Compilation flags:
`static`

Template:
`random_partition(List,Partition)`
Mode and number of proofs:
`random_partition(+list,-list)` - `one`

---

random_partition/3

Returns a random set partition of a list with an exact number of blocks.

Compilation flags:
`static`

Template:
`random_partition(K,List,Partition)`
Mode and number of proofs:
`random_partition(+integer,+list,-list)` - `zero_or_one`

---

sample_partitions/3

Returns SampleCount random set partitions of a list, sampled with replacement.

Compilation flags:
`static`

Template:
`sample_partitions(List,SampleCount,Samples)`
Mode and number of proofs:
`sample_partitions(+list,+integer,-list)` - `zero_or_one`

---

sample_partitions/4

Returns SampleCount random set partitions of a list with an exact number of blocks, sampled with replacement.

Compilation flags:
`static`

Template:
`sample_partitions(K,List,SampleCount,Samples)`
Mode and number of proofs:
`sample_partitions(+integer,+list,+integer,-list)` - `zero_or_one`

---

random_distinct_partition/2

Returns a random distinct set partition of a list (deduplicating equal-valued partitions).

Compilation flags:
`static`

Template:
`random_distinct_partition(List,Partition)`
Mode and number of proofs:
`random_distinct_partition(+list,-list)` - `one`

---

random_distinct_partition/3

Returns a random distinct set partition of a list with an exact number of blocks (deduplicating equal-valued partitions).

Compilation flags:
`static`

Template:
`random_distinct_partition(K,List,Partition)`
Mode and number of proofs:
`random_distinct_partition(+integer,+list,-list)` - `zero_or_one`

---

sample_distinct_partitions/3

Returns SampleCount random distinct set partitions of a list, sampled with replacement after deduplicating equal-valued partitions.

Compilation flags:
`static`

Template:
`sample_distinct_partitions(List,SampleCount,Samples)`
Mode and number of proofs:
`sample_distinct_partitions(+list,+integer,-list)` - `zero_or_one`

---

sample_distinct_partitions/4

Returns SampleCount random distinct set partitions of a list with an exact number of blocks, sampled with replacement after deduplicating equal-valued partitions.

Compilation flags:
`static`

Template:
`sample_distinct_partitions(K,List,SampleCount,Samples)`
Mode and number of proofs:
`sample_distinct_partitions(+integer,+list,+integer,-list)` - `zero_or_one`

---

next_partition/3

Returns the next distinct set partition value in lexicographic order induced by the first argument.

Compilation flags:
```
static
```

Template:
```
next_partition(List,Partition,Next)
```
Mode and number of proofs:
```
next_partition(+list,+list,-list) - zero_or_one
```

---

next_partition/4

Returns the next distinct set partition value with an exact number of blocks in lexicographic order induced by the second argument.

Compilation flags:
```
static
```

Template:
```
next_partition(K,List,Partition,Next)
```
Mode and number of proofs:
```
next_partition(+integer,+list,+list,-list) - zero_or_one
```

---

previous_partition/3

Returns the previous distinct set partition value in lexicographic order induced by the first argument.

Compilation flags:
```
static
```

Template:
```
previous_partition(List,Partition,Previous)
```
Mode and number of proofs:
```
previous_partition(+list,+list,-list) - zero_or_one
```

---

previous_partition/4

Returns the previous distinct set partition value with an exact number of blocks in lexicographic order induced by the second argument.

Compilation flags:
`static`

Template:
`previous_partition(K,List,Partition,Previous)`
Mode and number of proofs:
`previous_partition(+integer,+list,+list,-list)` - `zero_or_one`

1.252 paseto

object

1.252.1 paseto

Facade for PASETO v4 JSON claims encryption, signing, authentication, validation, and key selection.

Availability:
`logtalk_load(paseto(loader))`

Author: Paulo Moura
Version: 1:0:1
Date: 2026-10-28

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *paseto_helpers*
`public` *paseto_claims_helpers*
Uses:
list

paseto_claims
paseto_keys
paseto_v4

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Operators*

Public predicates

encrypt/4

Encrypts a JSON claims object as a v4.local token.

Compilation flags:
`static`

Template:
`encrypt(Claims,Key,Token,Options)`
Mode and number of proofs:
`encrypt(+term,+list(byte),-atom,+list(compound))` - `one_or_error`

Exceptions:
`Claims` is not a JSON object or contains duplicate members:
`domain_error(paseto_json_object,Claims)`
`Key` is not a list of 32 bytes:
`type_error(list(byte,32),Key)`
The footer `kid` conflicts with the `key_id/1` option:

`domain_error(paseto_footer_key_id,Existing-KeyId)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

---

decrypt/4

Authenticates and decrypts a v4.local claims token using a key or key set.

Compilation flags:

`static`

Template:

`decrypt(Token,KeyOrKeySet,Claims,Options)`

Mode and number of proofs:

`decrypt(+atom,+term,-term,+list(compound))` - `zero_or_one_or_error`

Exceptions:

`Token` is not a canonical v4.local token:

`domain_error(paseto_v4_token,Token)`

`KeyOrKeySet` is an invalid key set:

`domain_error(paseto_key_set,KeyOrKeySet)`

No key can be selected from `KeyOrKeySet`:

`existence_error(paseto_key,local-KeyId)`

The authenticated payload is not a JSON object:

`domain_error(paseto_json_object,Claims)`

The claims do not satisfy the validation policy:

`domain_error(paseto_claims,Reason)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

---

decrypt/5

Authenticates and decrypts a v4.local claims token and returns its authenticated footer JSON object.

Compilation flags:
`static`

Template:
`decrypt(Token,KeyOrKeySet,Claims,Footer,Options)`
Mode and number of proofs:
`decrypt(+atom,+term,-term,-term,+list(compound))` - `zero_or_one_or_error`

Exceptions:
`Token` is not a canonical v4.local token:
`domain_error(paseto_v4_token,Token)`
`KeyOrKeySet` is an invalid key set:
`domain_error(paseto_key_set,KeyOrKeySet)`
No key can be selected from `KeyOrKeySet`:
`existence_error(paseto_key,local-KeyId)`
The authenticated payload or footer is not a JSON object:
`domain_error(paseto_json_object,JSON)`
The claims do not satisfy the validation policy:
`domain_error(paseto_claims,Reason)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

sign/4

Signs a JSON claims object as a v4.public token using an Ed25519 seed.

Compilation flags:
`static`

Template:
`sign(Claims,Seed,Token,Options)`
Mode and number of proofs:
`sign(+term,+list(byte),-atom,+list(compound))` - `one_or_error`

Exceptions:

`Claims` is not a JSON object or contains duplicate members:
```
domain_error(paseto_json_object,Claims)
```
`Seed` is not a list of 32 bytes:
```
type_error(list(byte,32),Seed)
```
The footer `kid` conflicts with the `key_id/1` option:
```
domain_error(paseto_footer_key_id,Existing-KeyId)
```
`Options` is a variable:
```
instantiation_error
```
`Options` is neither a variable nor a list:
```
type_error(list,Options)
```
An element `Option` of the list `Options` is a variable:
```
instantiation_error
```
An element `Option` of the list `Options` is neither a variable nor a compound term:
```
type_error(compound,Option)
```
An element `Option` of the list `Options` is a compound term but not a valid option:
```
domain_error(option,Option)
```

---

verify/4

Authenticates and validates a v4.public claims token using a public key or key set.

Compilation flags:
```
static
```

Template:
```
verify(Token,KeyOrKeySet,Claims,Options)
```
Mode and number of proofs:
```
verify(+atom,+term,-term,+list(compound)) - zero_or_one_or_error
```

Exceptions:
`Token` is not a canonical v4.public token:
```
domain_error(paseto_v4_token,Token)
```
`KeyOrKeySet` is an invalid key set:
```
domain_error(paseto_key_set,KeyOrKeySet)
```
No key can be selected from `KeyOrKeySet`:
```
existence_error(paseto_key,(public)-KeyId)
```
The authenticated payload is not a JSON object:
```
domain_error(paseto_json_object,Claims)
```
The claims do not satisfy the validation policy:
```
domain_error(paseto_claims,Reason)
```
`Options` is a variable:
```
instantiation_error
```
`Options` is neither a variable nor a list:
```
type_error(list,Options)
```
An element `Option` of the list `Options` is a variable:
```
instantiation_error
```
An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

`verify/5`

Authenticates and validates a v4.public claims token and returns its authenticated footer JSON object.

Compilation flags:
`static`

Template:
`verify(Token,KeyOrKeySet,Claims,Footer,Options)`
Mode and number of proofs:
`verify(+atom,+term,-term,-term,+list(compound))` - `zero_or_one_or_error`

Exceptions:
`Token` is not a canonical v4.public token:
`domain_error(paseto_v4_token,Token)`
`KeyOrKeySet` is an invalid key set:
`domain_error(paseto_key_set,KeyOrKeySet)`
No key can be selected from `KeyOrKeySet`:
`existence_error(paseto_key,(public)-KeyId)`
The authenticated payload or footer is not a JSON object:
`domain_error(paseto_json_object,JSON)`
The claims do not satisfy the validation policy:
`domain_error(paseto_claims,Reason)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

claims/2

Decodes claims from a v4.public token without authenticating them. Rejects local tokens. The result must not be trusted.

Compilation flags:
`static`

Template:
`claims(Token,Claims)`
Mode and number of proofs:
`claims(+atom,-term)` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is not a canonical v4.public token:
`domain_error(paseto_v4_token,Token)`
`Token` has a malformed public payload:
`domain_error(paseto_v4_public_payload,Token)`
`Token` payload is not a JSON object:
`domain_error(paseto_json_object,Claims)`

---

claim/3

Looks up a value in a claims object.

Compilation flags:
`static`

Template:
`claim(Claims,Name,Value)`
Mode and number of proofs:
`claim(+term,+atom,-term)` - `zero_or_one`

---

validate_claims/3

Validates a claims object using a policy list and options.

Compilation flags:
`static`

Template:
`validate_claims(Claims,Policy,Options)`

Mode and number of proofs:

`validate_claims(+term,+list(compound),+list(compound))` - `one_or_error`

Exceptions:

`Claims` is not a JSON object or contains duplicate members:

`domain_error(paseto_json_object,Claims)`

`Claims` is missing a required claim `Name`:

`domain_error(paseto_claims,missing(Name))`

`Policy` contains an invalid claim policy:

`domain_error(paseto_claim_policy,ClaimPolicy)`

A time claim has a non-numeric value:

`type_error(time_number,Name-Value)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`validate_claim/3`

Validates one claim policy.

Compilation flags:

`static`

Template:

`validate_claim(Claims,ClaimPolicy,Options)`

Meta-predicate template:

`validate_claim(*,*,*)`

Mode and number of proofs:

`validate_claim(+term,+compound,+list(compound))` - `one_or_error`

Exceptions:

`Claims` is missing the required claim `Name`:

`domain_error(paseto_claims,missing(Name))`

The value of claim `Name` does not satisfy the policy:

`domain_error(paseto_claim(Name),Value)`

`ClaimPolicy` is not a supported claim policy:

`domain_error(paseto_claim_policy,ClaimPolicy)`

A time claim has an unknown validation kind:

`domain_error(paseto_time_claim_kind,Kind)`

A time claim has a non-numeric value:

`type_error(time_number,Name-Value)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

---

peek_key_id/2

Reads a kid value from the unauthenticated token footer for key selection. The result must not be trusted.

Compilation flags:

`static`

Template:

`peek_key_id(Token,KeyId)`

Mode and number of proofs:

`peek_key_id(+atom,-atom)` - `zero_or_one_or_error`

Exceptions:

`Token` is a variable:

`instantiation_error`

`Token` is neither a variable nor an atom:

`type_error(atom,Token)`

`Token` is not a canonical v4 token:

`domain_error(paseto_v4_token,Token)`

`Token` footer is not a JSON object:

`domain_error(paseto_json_object,Footer)`

---

validate_key_set/1

Validates a native PASETO key_set/1 term.

Compilation flags:

`static`

Template:

`validate_key_set(KeySet)`

Mode and number of proofs:

`validate_key_set(+compound)` - `one_or_error`

Exceptions:
`KeySet` is not a valid `key_set/1` term:
`domain_error(paseto_key_set,KeySet)`
`KeySet` contains an invalid key record `Record`:
`domain_error(paseto_key_record,Record)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

Public predicates

validate_claims/3

Validates claims using registered-claim defaults, a policy list, and options.

Compilation flags:

`static`

Template:

`validate_claims(Claims,Policy,Options)`

Mode and number of proofs:

`validate_claims(+term,+list(compound),+list(compound))` - `one_or_error`

Exceptions:

`Claims` is not a JSON object or contains duplicate members:

`domain_error(paseto_json_object,Claims)`

`Claims` is missing a required claim `Name`:

`domain_error(paseto_claims,missing(Name))`

`Policy` contains an invalid claim policy:

`domain_error(paseto_claim_policy,ClaimPolicy)`

A time claim has a non-numeric value:

`type_error(time_number,Name-Value)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

validate_claim/3

Validates one claim policy against a claims object.

Compilation flags:
`static`

Template:
`validate_claim(Claims,ClaimPolicy,Options)`
Meta-predicate template:
`validate_claim(*,*,*)`
Mode and number of proofs:
`validate_claim(+term,+compound,+list(compound))` - `one_or_error`

Exceptions:
`Claims` is missing the required claim `Name`:
`domain_error(paseto_claims,missing(Name))`
The value of claim `Name` does not satisfy the policy:
`domain_error(paseto_claim(Name),Value)`
`ClaimPolicy` is not a supported claim policy:
`domain_error(paseto_claim_policy,ClaimPolicy)`
A time claim has an unknown validation kind:
`domain_error(paseto_time_claim_kind,Kind)`
A time claim has a non-numeric value:
`type_error(time_number,Name-Value)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

claim/3

Looks up a claim value by name.

Compilation flags:
`static`

Template:
`claim(Claims,Name,Value)`
Mode and number of proofs:
`claim(+term,+atom,-term)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
category

1.252.3 paseto_claims_helpers

Shared JSON and option helpers for PASETO claims workflows.

Availability:
`logtalk_load(paseto(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-08

Compilation flags:
`static`

Extends:
`public` *options*
Uses:
json
list

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
- *Protected predicates*
  - *json_member/3*
  - *json_object_pairs/2*
  - *json_object/1*
  - *json_bytes/2*
  - *byte_list/1*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

json_member/3

Enumerates JSON object member values for a key.

Compilation flags:
`static`

Template:
`json_member(Key,Object,Value)`
Mode and number of proofs:
`json_member(+atom,+term,-term)` - `zero_or_more`

---

json_object_pairs/2

Extracts pairs from a JSON object term.

Compilation flags:
`static`

Template:
`json_object_pairs(Object,Pairs)`
Mode and number of proofs:
`json_object_pairs(+term,-list(compound))` - `zero_or_one`

---

json_object/1

Validates a JSON object and rejects duplicate member names.

Compilation flags:
`static`

Template:
`json_object(Object)`
Mode and number of proofs:
`json_object(+term)` - `one_or_error`

Exceptions:
`Object` is not a JSON object or contains duplicate members:
`domain_error(paseto_json_object,Object)`

---

json_bytes/2

Converts between a JSON term and its UTF-8-compatible byte representation.

Compilation flags:
`static`

Template:
`json_bytes(JSON,Bytes)`
Mode and number of proofs:
`json_bytes(+term,-list(byte))` - `one_or_error`
`json_bytes(-term,+list(byte))` - `one_or_error`

Exceptions:
`JSON` cannot be generated as JSON text:
`domain_error(json_term,JSON)`
`Bytes` cannot be parsed as JSON text:
`domain_error(json_text,Bytes)`

---

byte_list/1

Succeeds when the argument is a proper list of bytes.

Compilation flags:
`static`

Template:
`byte_list(Bytes)`
Mode and number of proofs:
`byte_list(+term)` - `zero_or_one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
category

1.252.4 paseto_helpers

Protected PASETO v4 framing, PAE, and encoding helpers.

Availability:
`logtalk_load(paseto(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-08

Compilation flags:
`static`

Uses:
base64url_no_padding
list

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
- *Protected predicates*
  - *pae/2*
  - *parse_token/4*
  - *format_token/4*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

pae/2

Pre-authentication encodes a list of byte-list pieces.

Compilation flags:
`static`

Template:
`pae(Pieces,Encoding)`
Mode and number of proofs:

```
pae(+list(list(byte)),-list(byte)) - one
```

---

parse_token/4

Strictly parses a canonical v4 token for Purpose and decodes its body and optional footer.

Compilation flags:

```
static
```

Template:

```
parse_token(Token,Purpose,Body,Footer)
```

Mode and number of proofs:

```
parse_token(+atom,+atom,-list(byte),-list(byte)) - one_or_error
```

Exceptions:

`Token` is a variable:

```
instantiation_error
```

`Token` is neither a variable nor an atom:

```
type_error(atom,Token)
```

`Token` is an atom but does not have the expected PASETO v4 header:

```
domain_error(paseto_v4_token,Token)
```

`Token` is a PASETO v4 header but has a malformed compact serialization:

```
domain_error(paseto_compact_serialization,malformed)
```

`Token` contains non-canonical base64url data:

```
representation_error(base64)
```

---

format_token/4

Formats a canonical v4 token for Purpose from body and footer bytes.

Compilation flags:

```
static
```

Template:

```
format_token(Purpose,Body,Footer,Token)
```

Mode and number of proofs:

```
format_token(+atom,+list(byte),+list(byte),-atom) - one
```

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.252.5 paseto_keys

Validation and selection for native PASETO v4 key sets.

Availability:
`logtalk_load(paseto(loader))`

Author: Paulo Moura
Version: 1:0:1
Date: 2026-10-28

Compilation flags:
`static, context_switching_calls`

Uses:
list

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *validate/1*
  - *select_keys/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

validate/1

Validates a key_set/1 term containing local/2 and public/2 records.

Compilation flags:
`static`

Template:

```
validate(KeySet)
```

Mode and number of proofs:

```
validate(+compound) - one_or_error
```

Exceptions:

`KeySet` is not a valid `key_set/1` term:

```
domain_error(paseto_key_set,KeySet)
```

`KeySet` contains an invalid key record `Record`:

```
domain_error(paseto_key_record,Record)
```

`select_keys/4`

Selects all keys matching Purpose and optional KeyId, preserving key-set order.

Compilation flags:

```
static
```

Template:

```
select_keys(KeySet,Purpose,KeyId,Keys)
```

Mode and number of proofs:

```
select_keys(+compound,+atom,+term,-list(list(byte))) - one_or_error
```

Exceptions:

`KeySet` is not a valid `key_set/1` term:

```
domain_error(paseto_key_set,KeySet)
```

`KeySet` contains an invalid key record `Record`:

```
domain_error(paseto_key_record,Record)
```

No key matches `Purpose` and `KeyId`:

```
existence_error(paseto_key,Purpose-KeyId)
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.252.6 paseto_protocol

PASETO v4.local and v4.public protocol for byte payloads.

Availability:
`logtalk_load(paseto(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-08

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *local_key/1*
  - *public_keypair/2*
  - *local_encrypt/3*
  - *local_encrypt/5*
  - *local_decrypt/3*
  - *local_decrypt/5*
  - *public_sign/3*
  - *public_sign/5*
  - *public_verify/3*
  - *public_verify/5*
  - *footer/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

local_key/1

Generates a 32-byte v4.local key.

Compilation flags:
`static`

Template:
`local_key(Key)`
Mode and number of proofs:
`local_key(-list(byte))` - `one`

---

public_keypair/2

Generates an Ed25519 seed and public key for v4.public tokens.

Compilation flags:
`static`

Template:
`public_keypair(Seed,PublicKey)`
Mode and number of proofs:
`public_keypair(-list(byte),-list(byte))` - `one`

---

local_encrypt/3

Encrypts Payload using a 32-byte local Key and empty footer and implicit assertion.

Compilation flags:
`static`

Template:
`local_encrypt(Key,Payload,Token)`
Mode and number of proofs:
`local_encrypt(+list(byte),+list(byte),-atom)` - `one_or_error`

Exceptions:
`Key` is a variable or a partial list:
`instantiation_error`
`Key` is not a list of the required number of bytes:
`type_error(list(byte,32),Key)`
`Key` contains a non-integer byte:
`type_error(integer,Byte)`

`Key` contains an integer outside the byte range:
```
domain_error(byte,Byte)
```
`Payload` is a variable or a partial list:
```
instantiation_error
```
`Payload` is not a list of the required number of bytes:
```
type_error(list(byte,32),Payload)
```
`Payload` contains a non-integer byte:
```
type_error(integer,Byte)
```
`Payload` contains an integer outside the byte range:
```
domain_error(byte,Byte)
```

`local_encrypt/5`

Encrypts Payload using a 32-byte local Key and authenticates Footer and ImplicitAssertion.

Compilation flags:
```
static
```

Template:
```
local_encrypt(Key,Payload,Footer,ImplicitAssertion,Token)
```
Mode and number of proofs:
```
local_encrypt(+list(byte),+list(byte),+list(byte),+list(byte),-atom) -
one_or_error
```

Exceptions:
`Key` is a variable or a partial list:
```
instantiation_error
```
`Key` is not a list of the required number of bytes:
```
type_error(list(byte,32),Key)
```
`Key` contains a non-integer byte:
```
type_error(integer,Byte)
```
`Key` contains an integer outside the byte range:
```
domain_error(byte,Byte)
```
`Payload` is a variable or a partial list:
```
instantiation_error
```
`Payload` is not a list of the required number of bytes:
```
type_error(list(byte,32),Payload)
```
`Payload` contains a non-integer byte:
```
type_error(integer,Byte)
```
`Payload` contains an integer outside the byte range:
```
domain_error(byte,Byte)
```
`Footer` is a variable or a partial list:
```
instantiation_error
```
`Footer` is not a list of the required number of bytes:
```
type_error(list(byte,32),Footer)
```
`Footer` contains a non-integer byte:
```
type_error(integer,Byte)
```

`Footer` contains an integer outside the byte range:
`domain_error(byte,Byte)`
`ImplicitAssertion` is a variable or a partial list:
`instantiation_error`
`ImplicitAssertion` is not a list of the required number of bytes:
`type_error(list(byte,32),ImplicitAssertion)`
`ImplicitAssertion` contains a non-integer byte:
`type_error(integer,Byte)`
`ImplicitAssertion` contains an integer outside the byte range:
`domain_error(byte,Byte)`

`local_decrypt/3`

Authenticates and decrypts a local Token using an empty implicit assertion.

Compilation flags:
`static`

Template:
`local_decrypt(Token,Key,Payload)`
Mode and number of proofs:
`local_decrypt(+atom,+list(byte),-list(byte))` - `zero_or_one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a canonical v4.local token:
`domain_error(paseto_v4_token,Token)`
`Key` is a variable or a partial list:
`instantiation_error`
`Key` is not a list of the required number of bytes:
`type_error(list(byte,32),Key)`
`Key` contains a non-integer byte:
`type_error(integer,Byte)`
`Key` contains an integer outside the byte range:
`domain_error(byte,Byte)`

---

local_decrypt/5

Authenticates and decrypts a local Token using ImplicitAssertion and returns its authenticated Footer.

Compilation flags:

```
static
```

Template:

```
local_decrypt(Token,Key,ImplicitAssertion,Payload,Footer)
```

Mode and number of proofs:

```
local_decrypt(+atom,+list(byte),+list(byte),-list(byte),-list(byte)) -
zero_or_one_or_error
```

Exceptions:

`Token` is a variable:

```
instantiation_error
```

`Token` is neither a variable nor an atom:

```
type_error(atom,Token)
```

`Token` is an atom but not a canonical v4.local token:

```
domain_error(paseto_v4_token,Token)
```

`Token` is a v4.local token but has a malformed compact serialization:

```
domain_error(paseto_compact_serialization,malformed)
```

`Token` contains non-canonical base64url data:

```
representation_error(base64)
```

`Token` has a malformed local payload:

```
domain_error(paseto_v4_local_payload,Token)
```

`Key` is a variable or a partial list:

```
instantiation_error
```

`Key` is not a list of the required number of bytes:

```
type_error(list(byte,32),Key)
```

`Key` contains a non-integer byte:

```
type_error(integer,Byte)
```

`Key` contains an integer outside the byte range:

```
domain_error(byte,Byte)
```

`ImplicitAssertion` is a variable or a partial list:

```
instantiation_error
```

`ImplicitAssertion` is not a list of the required number of bytes:

```
type_error(list(byte,32),ImplicitAssertion)
```

`ImplicitAssertion` contains a non-integer byte:

```
type_error(integer,Byte)
```

`ImplicitAssertion` contains an integer outside the byte range:

```
domain_error(byte,Byte)
```

public_sign/3

Signs Payload using an Ed25519 Seed and empty footer and implicit assertion.

Compilation flags:
`static`

Template:
`public_sign(Seed,Payload,Token)`
Mode and number of proofs:
`public_sign(+list(byte),+list(byte),-atom)` - `one_or_error`

Exceptions:
`Seed` is a variable or a partial list:
`instantiation_error`
`Seed` is not a list of the required number of bytes:
`type_error(list(byte,32),Seed)`
`Seed` contains a non-integer byte:
`type_error(integer,Byte)`
`Seed` contains an integer outside the byte range:
`domain_error(byte,Byte)`
`Payload` is a variable or a partial list:
`instantiation_error`
`Payload` is not a list of the required number of bytes:
`type_error(list(byte,32),Payload)`
`Payload` contains a non-integer byte:
`type_error(integer,Byte)`
`Payload` contains an integer outside the byte range:
`domain_error(byte,Byte)`

---

public_sign/5

Signs Payload using an Ed25519 Seed and authenticates Footer and ImplicitAssertion.

Compilation flags:
`static`

Template:
`public_sign(Seed,Payload,Footer,ImplicitAssertion,Token)`
Mode and number of proofs:
`public_sign(+list(byte),+list(byte),+list(byte),+list(byte),-atom)` - `one_or_error`

Exceptions:
`Seed` is a variable or a partial list:
`instantiation_error`
`Seed` is not a list of the required number of bytes:
`type_error(list(byte,32),Seed)`

`Seed` contains a non-integer byte:
`type_error(integer,Byte)`
`Seed` contains an integer outside the byte range:
`domain_error(byte,Byte)`
`Payload` is a variable or a partial list:
`instantiation_error`
`Payload` is not a list of the required number of bytes:
`type_error(list(byte,32),Payload)`
`Payload` contains a non-integer byte:
`type_error(integer,Byte)`
`Payload` contains an integer outside the byte range:
`domain_error(byte,Byte)`
`Footer` is a variable or a partial list:
`instantiation_error`
`Footer` is not a list of the required number of bytes:
`type_error(list(byte,32),Footer)`
`Footer` contains a non-integer byte:
`type_error(integer,Byte)`
`Footer` contains an integer outside the byte range:
`domain_error(byte,Byte)`
`ImplicitAssertion` is a variable or a partial list:
`instantiation_error`
`ImplicitAssertion` is not a list of the required number of bytes:
`type_error(list(byte,32),ImplicitAssertion)`
`ImplicitAssertion` contains a non-integer byte:
`type_error(integer,Byte)`
`ImplicitAssertion` contains an integer outside the byte range:
`domain_error(byte,Byte)`

`public_verify/3`

Authenticates a public Token using an Ed25519 public key and empty implicit assertion.

Compilation flags:
`static`

Template:
`public_verify(Token,PublicKey,Payload)`
Mode and number of proofs:
`public_verify(+atom,+list(byte),-list(byte))` - `zero_or_one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a canonical v4.public token:

`domain_error(paseto_v4_token,Token)`
`PublicKey` is a variable or a partial list:
`instantiation_error`
`PublicKey` is not a list of the required number of bytes:
`type_error(list(byte,32),PublicKey)`
`PublicKey` contains a non-integer byte:
`type_error(integer,Byte)`
`PublicKey` contains an integer outside the byte range:
`domain_error(byte,Byte)`

---

public_verify/5

Authenticates a public Token using an Ed25519 public key and ImplicitAssertion and returns its authenticated Footer.

Compilation flags:
`static`

Template:
`public_verify(Token,PublicKey,ImplicitAssertion,Payload,Footer)`
Mode and number of proofs:
`public_verify(+atom,+list(byte),+list(byte),-list(byte),-list(byte))` - `zero_or_one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a canonical v4 token:
`domain_error(paseto_v4_token,Token)`
`Token` is a canonical v4 token but has a malformed compact serialization:
`domain_error(paseto_compact_serialization,malformed)`
`Token` contains non-canonical base64url data:
`representation_error(base64)`
`Token` has a malformed public payload:
`domain_error(paseto_v4_public_payload,Token)`
`PublicKey` is a variable or a partial list:
`instantiation_error`
`PublicKey` is not a list of the required number of bytes:
`type_error(list(byte,32),PublicKey)`
`PublicKey` contains a non-integer byte:
`type_error(integer,Byte)`
`PublicKey` contains an integer outside the byte range:
`domain_error(byte,Byte)`
`ImplicitAssertion` is a variable or a partial list:
`instantiation_error`
`ImplicitAssertion` is not a list of the required number of bytes:

`type_error(list(byte,32),ImplicitAssertion)`
`ImplicitAssertion` contains a non-integer byte:
`type_error(integer,Byte)`
`ImplicitAssertion` contains an integer outside the byte range:
`domain_error(byte,Byte)`

`footer/2`

Extracts a token footer without authenticating it. The result must only be used for pre-authentication key selection.

Compilation flags:
`static`

Template:
`footer(Token,Footer)`
Mode and number of proofs:
`footer(+atom,-list(byte))` - `one_or_error`

Exceptions:
`Token` is a variable:
`instantiation_error`
`Token` is neither a variable nor an atom:
`type_error(atom,Token)`
`Token` is an atom but not a canonical v4 token:
`domain_error(paseto_v4_token,Token)`
`Token` is a canonical v4 token but has a malformed compact serialization:
`domain_error(paseto_compact_serialization,malformed)`
`Token` contains non-canonical base64url data:
`representation_error(base64)`

  - *local_encrypt_with_nonce/6*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

`local_encrypt_with_nonce/6`

Encrypts a local payload using an explicit 32-byte nonce. Intended for deterministic conformance tests; production callers must use local_encrypt/3 or local_encrypt/5.

Compilation flags:

`static`

Template:

`local_encrypt_with_nonce(Key,Nonce,Payload,Footer,ImplicitAssertion,Token)`

Mode and number of proofs:

`local_encrypt_with_nonce(+list(byte),+list(byte),+list(byte),+list(byte),+list(byte),-atom)` - `one_or_error`

Exceptions:

`Key` is a variable or a partial list:

`instantiation_error`

`Key` is not a list of the required number of bytes:

`type_error(list(byte,32),Key)`

`Key` contains a non-integer byte:

`type_error(integer,Byte)`

`Key` contains an integer outside the byte range:

`domain_error(byte,Byte)`

`Nonce` is a variable or a partial list:

`instantiation_error`

`Nonce` is not a list of the required number of bytes:

`type_error(list(byte,32),Nonce)`

`Nonce` contains a non-integer byte:

`type_error(integer,Byte)`

`Nonce` contains an integer outside the byte range:

`domain_error(byte,Byte)`

`Payload` is a variable or a partial list:

`instantiation_error`

`Payload` is not a list of the required number of bytes:

`type_error(list(byte,32),Payload)`

`Payload` contains a non-integer byte:

`type_error(integer,Byte)`

`Payload` contains an integer outside the byte range:

`domain_error(byte,Byte)`

`Footer` is a variable or a partial list:

`instantiation_error`

`Footer` is not a list of the required number of bytes:

`type_error(list(byte,32),Footer)`

`Footer` contains a non-integer byte:

`type_error(integer,Byte)`

`Footer` contains an integer outside the byte range:
`domain_error(byte,Byte)`
`ImplicitAssertion` is a variable or a partial list:
`instantiation_error`
`ImplicitAssertion` is not a list of the required number of bytes:
`type_error(list(byte,32),ImplicitAssertion)`
`ImplicitAssertion` contains a non-integer byte:
`type_error(integer,Byte)`
`ImplicitAssertion` contains an integer outside the byte range:
`domain_error(byte,Byte)`

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

pattern_miner_diagnostics_data/2

Hook predicate that importing pattern miner implementations must define in order to expose diagnostics metadata.

Compilation flags:

```
static
```

Template:

```
pattern_miner_diagnostics_data(PatternMiner,Diagnostics)
```

Mode and number of proofs:

```
pattern_miner_diagnostics_data(+compound,-list(compound)) - one
```

---

pattern_miner_diagnostics/6

Builds a standard diagnostics list from generic pattern miner metadata and algorithm-specific diagnostics terms.

Compilation flags:

```
static
```

Template:

```
pattern_miner_diagnostics(Model,ItemDomain,Patterns,Options,SpecificDiagnostics,
Diagnostics)
```

Mode and number of proofs:

```
pattern_miner_diagnostics(+atom,+list(atom),+list(compound),+list(compound),
+list(compound),-list(compound)) - one
```

---

pattern_miner_export_template/4

Hook predicate that importing pattern miner implementations must define in order to expose the exported pattern miner template for a given functor.

Compilation flags:

```
static
```

Template:

```
pattern_miner_export_template(Dataset,PatternMiner,Functor,Template)
```

Mode and number of proofs:

```
pattern_miner_export_template(+object_identifier,+compound,+atom,-callable) - one
```

---

valid_pattern_miner_metadata/5

True when the diagnostics list matches the generic pattern miner metadata implied by the model, item domain, mined patterns, and effective options.

Compilation flags:

```
static
```

Template:

```
valid_pattern_miner_metadata(Model,ItemDomain,Patterns,Options,Diagnostics)
```

Mode and number of proofs:

```
valid_pattern_miner_metadata(+atom,+list(atom),+list(compound),+list(compound),
+list(compound)) - zero_or_one
```

---

check_item_domain/1

Validates that the declared item domain is canonical and contains only atoms.

Compilation flags:

```
static
```

Template:

```
check_item_domain(ItemDomain)
```

Mode and number of proofs:

```
check_item_domain(+list(atom)) - one
```

---

effective_support_count/3

Computes the effective minimum support count from the effective options and the dataset size.

Compilation flags:
```
static
```

Template:
```
effective_support_count(DatasetSize,Options,SupportCount)
```
Mode and number of proofs:
```
effective_support_count(+integer,+list(compound),-integer) - one
```

---

effective_maximum_pattern_length/3

Computes the effective maximum pattern length from the effective options and the dataset maximum pattern length.

Compilation flags:
```
static
```

Template:
```
effective_maximum_pattern_length(DatasetMaximumPatternLength,Options,
MaximumPatternLength)
```
Mode and number of proofs:
```
effective_maximum_pattern_length(+integer,+list(compound),-integer) - one
```

Public predicates

mine/3

Mines a pattern miner result from the given dataset object using the specified options.

Compilation flags:
`static`

Template:
`mine(Dataset,PatternMiner,Options)`
Mode and number of proofs:
`mine(+object_identifier,-compound,+list(compound))` - `one`

mine/2

Mines a pattern miner result from the given dataset object using default options.

Compilation flags:
```
static
```

Template:
```
mine(Dataset,PatternMiner)
```
Mode and number of proofs:
```
mine(+object_identifier,-compound) - one
```

---

diagnostics/2

Returns diagnostics and metadata associated with a mined pattern miner in a representation-independent way.

Compilation flags:
```
static
```

Template:
```
diagnostics(PatternMiner,Diagnostics)
```
Mode and number of proofs:
```
diagnostics(+compound,-list(compound)) - one
```

---

diagnostic/2

Tests or enumerates individual diagnostics metadata terms for a mined pattern miner.

Compilation flags:
```
static
```

Template:
```
diagnostic(PatternMiner,Diagnostic)
```
Mode and number of proofs:
```
diagnostic(+compound,?compound) - zero_or_more
```

---

pattern_miner_options/2

Returns the effective mining options recorded in a mined pattern miner diagnostics list.

Compilation flags:
`static`

Template:
`pattern_miner_options(PatternMiner,Options)`
Mode and number of proofs:
`pattern_miner_options(+compound,-list(compound))` - `zero_or_one`

---

check_pattern_miner/1

Checks that the argument is a structurally valid mined pattern miner term for the receiving pattern miner implementation, throwing an exception on invalid input when applicable.

Compilation flags:
`static`

Template:
`check_pattern_miner(PatternMiner)`
Mode and number of proofs:
`check_pattern_miner(@compound)` - `one_or_error`

Exceptions:
`PatternMiner` is a variable:
`instantiation_error`
`PatternMiner` is neither a variable nor a valid pattern miner:
`domain_error(pattern_miner,PatternMiner)`

---

valid_pattern_miner/1

True when `check_pattern_miner/1` succeeds for the argument without throwing an exception.

Compilation flags:
`static`

Template:
`valid_pattern_miner(PatternMiner)`
Mode and number of proofs:
`valid_pattern_miner(@compound)` - `zero_or_one`

---

export_to_clauses/4

Converts a pattern miner result into a list of predicate clauses. `Functor` is the functor for the generated predicate clauses.

Compilation flags:
`static`

Template:
`export_to_clauses(Dataset,PatternMiner,Functor,Clauses)`
Mode and number of proofs:
`export_to_clauses(+object_identifier,+compound,+callable,-list(clause))` - `one`

---

export_to_file/4

Exports a pattern miner result to a file. `Functor` is the functor for the generated predicate clauses.

Compilation flags:
`static`

Template:
`export_to_file(Dataset,PatternMiner,Functor,File)`
Mode and number of proofs:
`export_to_file(+object_identifier,+compound,+callable,+atom)` - `one`

---

print_pattern_miner/1

Prints a pattern miner result to the current output stream in a human-readable format.

Compilation flags:
`static`

Template:
`print_pattern_miner(PatternMiner)`
Mode and number of proofs:
`print_pattern_miner(+compound)` - `one`

Public predicates

parse_domain/3

Parses a PDDL 3.0 domain file, returning a compound term representing its contents and rest of the file. Useful when domain and problem are in one file.

Compilation flags:
`static`

Template:
`parse_domain(File,Output,RestOfFile)`
Mode and number of proofs:
`parse_domain(+atom,-compound,-list(atom))` - `one`

---

parse_domain/2

Parses a PDDL 3.0 domain file, returning a compound term representing its contents.

Compilation flags:
`static`

Template:
`parse_domain(File,Output)`
Mode and number of proofs:
`parse_domain(+atom,-compound)` - `one`

---

parse_problem/2

Parses a PDDL 3.0 problem file, returning a compound term representing its contents.

Compilation flags:
```
static
```

Template:
```
parse_problem(File,Output)
```
Mode and number of proofs:
```
parse_problem(+atom,-compound) - one
```

---

parse_problem/3

Parses a PDDL 3.0 problem file, returning a compound term representing its contents and rest of the file. Useful when domain and problem are in one file.

Compilation flags:
```
static
```

Template:
```
parse_problem(File,Output,RestOfFile)
```
Mode and number of proofs:
```
parse_problem(+atom,-compound,-list(atom)) - one
```

Public predicates

permutations/2

Generates all permutations of a list using default order.

Compilation flags:
    `static`

Template:
    `permutations(List,Permutations)`
Mode and number of proofs:
    `permutations(+list,-list) - one`

---

permutation/2

True iff the second argument is a permutation of the first argument using default order.

Compilation flags:
    `static`

Template:
    `permutation(List,Permutation)`
Mode and number of proofs:

`permutation(+list,-list)` - `one_or_more`

---

permutations/3

Generates all permutations with the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`permutations(List,Order,Permutations)`
Mode and number of proofs:
`permutations(+list,+atom,-list)` - `one`

---

permutation/3

True iff the third argument is a permutation with the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`permutation(List,Order,Permutation)`
Mode and number of proofs:
`permutation(+list,+atom,-list)` - `one_or_more`

---

distinct_permutations/2

Generates all distinct permutations of a list (deduplicating repeated values in the input list) using default order.

Compilation flags:
`static`

Template:
`distinct_permutations(List,Permutations)`
Mode and number of proofs:
`distinct_permutations(+list,-list)` - `one`

---

distinct_permutation/2

True iff the second argument is a distinct permutation of the first argument using default order.

Compilation flags:
`static`

Template:
`distinct_permutation(List,Permutation)`
Mode and number of proofs:
`distinct_permutation(+list,-list)` - `one_or_more`

---

distinct_permutations/3

Generates all distinct permutations with the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`distinct_permutations(List,Order,Permutations)`
Mode and number of proofs:
`distinct_permutations(+list,+atom,-list)` - `one`

---

distinct_permutation/3

True iff the third argument is a distinct permutation with the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`distinct_permutation(List,Order,Permutation)`
Mode and number of proofs:
`distinct_permutation(+list,+atom,-list)` - `one_or_more`

---

k_permutations/3

Generates all K-permutations (ordered selections) of a list using default order.

Compilation flags:
`static`

Template:
`k_permutations(K,List,Permutations)`
Mode and number of proofs:
`k_permutations(+integer,+list,-list)` - `one`

---

k_permutation/3

True iff the third argument is a K-permutation (ordered selection) of a list using default order.

Compilation flags:
`static`

Template:
`k_permutation(K,List,Permutation)`
Mode and number of proofs:
`k_permutation(+integer,+list,-list)` - `one_or_more`

---

k_permutations/4

Generates all K-permutations with the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`k_permutations(K,List,Order,Permutations)`
Mode and number of proofs:
`k_permutations(+integer,+list,+atom,-list)` - `one`

---

k_permutation/4

True iff the fourth argument is a K-permutation with the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`k_permutation(K,List,Order,Permutation)`
Mode and number of proofs:
`k_permutation(+integer,+list,+atom,-list)` - `one_or_more`

---

next_permutation/2

Returns the next permutation value in lexicographic order.

Compilation flags:
`static`

Template:
`next_permutation(Permutation,Next)`
Mode and number of proofs:
`next_permutation(+list,-list)` - `zero_or_one`

---

previous_permutation/2

Returns the previous permutation value in lexicographic order.

Compilation flags:
`static`

Template:
`previous_permutation(Permutation,Previous)`
Mode and number of proofs:
`previous_permutation(+list,-list)` - `zero_or_one`

---

nth_permutation/3

Returns the permutation at a given zero-based index using default order.

Compilation flags:
`static`

Template:
`nth_permutation(List,Index,Permutation)`
Mode and number of proofs:
`nth_permutation(+list,+integer,-list)` - `zero_or_one`

---

nth_permutation/4

Returns the permutation at a given zero-based index in the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`nth_permutation(List,Order,Index,Permutation)`
Mode and number of proofs:
`nth_permutation(+list,+atom,+integer,-list)` - `zero_or_one`

---

permutation_index/3

Returns the zero-based index of a permutation using default order.

Compilation flags:
`static`

Template:
`permutation_index(List,Permutation,Index)`
Mode and number of proofs:
`permutation_index(+list,+list,-integer)` - `zero_or_one`

---

permutation_index/4

Returns the zero-based index of a permutation in the given order: `default`, `lexicographic`, or `shortlex`.

Compilation flags:
`static`

Template:
`permutation_index(List,Order,Permutation,Index)`
Mode and number of proofs:
`permutation_index(+list,+atom,+list,-integer)` - `zero_or_one`

---

count_permutations/2

Counts the number of permutations of a list.

Compilation flags:
`static`

Template:
`count_permutations(List,Count)`
Mode and number of proofs:
`count_permutations(+list,-integer)` - `one`

---

count_distinct_permutations/2

Counts the number of distinct permutations of a list (deduplicating equal-valued permutations).

Compilation flags:
`static`

Template:
`count_distinct_permutations(List,Count)`
Mode and number of proofs:
`count_distinct_permutations(+list,-integer)` - `one`

---

nth_distinct_permutation/3

Returns the distinct permutation at a given zero-based index in default generation order.

Compilation flags:
`static`

Template:
`nth_distinct_permutation(List,Index,Permutation)`
Mode and number of proofs:
`nth_distinct_permutation(+list,+integer,-list)` - `zero_or_one`

---

distinct_permutation_index/3

Returns the zero-based index of a distinct permutation in default generation order.

Compilation flags:
`static`

Template:
`distinct_permutation_index(List,Permutation,Index)`
Mode and number of proofs:
`distinct_permutation_index(+list,+list,-integer)` - `zero_or_one`

---

random_permutation/2

Returns a random permutation of a list.

Compilation flags:
`static`

Template:
`random_permutation(List,Permutation)`
Mode and number of proofs:
`random_permutation(+list,-list)` - `one`

---

sample_permutations/3

Returns SampleCount random permutations of a list, sampled with replacement.

Compilation flags:
```
static
```

Template:
```
sample_permutations(List,SampleCount,Samples)
```
Mode and number of proofs:
```
sample_permutations(+list,+integer,-list) - zero_or_one
```

---

random_distinct_permutation/2

Returns a random distinct permutation of a list (deduplicating equal-valued permutations).

Compilation flags:
```
static
```

Template:
```
random_distinct_permutation(List,Permutation)
```
Mode and number of proofs:
```
random_distinct_permutation(+list,-list) - one
```

---

sample_distinct_permutations/3

Returns SampleCount random distinct permutations of a list, sampled with replacement after deduplicating equal-valued permutations.

Compilation flags:
```
static
```

Template:
```
sample_distinct_permutations(List,SampleCount,Samples)
```
Mode and number of proofs:
```
sample_distinct_permutations(+list,+integer,-list) - zero_or_one
```

Public predicates

start/0

Activates the ports profiler for followup goals.

Compilation flags:
`static`

Mode and number of proofs:
`start` - `one`

---

stop/0

Deactivates the ports profiler.

Compilation flags:
`static`

Mode and number of proofs:
`stop` - `one`

---

data/0

Prints a table with all port profiling data.

Compilation flags:
`static`

Mode and number of proofs:
`data` - `one`

---

data/1

Prints a table with all port profiling data for the specified entity.

Compilation flags:

```
static
```

Template:

```
data(Entity)
```

Mode and number of proofs:

```
data(+entity_identifier) - one
```

---

data/2

Prints a table with all port profiling data for the specified entity predicate (or non-terminal).

Compilation flags:

```
static
```

Template:

```
data(Entity,Predicate)
```

Mode and number of proofs:

```
data(+entity_identifier,+predicate_indicator) - one
data(+entity_identifier,+non_terminal_indicator) - one
```

---

reset/0

Resets all port profiling data.

Compilation flags:

```
static
```

Mode and number of proofs:

```
reset - one
```

---

reset/1

Resets all port profiling data for the specified entity.

Compilation flags:

```
static
```

Template:

```
reset(Entity)
```

Mode and number of proofs:

```
reset(+entity_identifier) - one
```

---

port/5

Enumerates, by backtracking, all collected port profiling data.

Compilation flags:

```
static
```

Template:

```
port(Port,Entity,Functor,Arity,Count)
```

Mode and number of proofs:

```
port(?atom,?entity_identifier,?atom,?integer,?integer) - zero_or_more
```

---

clause_location/6

Enumerates, by backtracking, all collected profiled clause location data.

Compilation flags:

```
static
```

Template:

```
clause_location(Entity,Functor,Arity,ClauseNumber,File,BeginLine)
```

Mode and number of proofs:

```
clause_location(?entity_identifier,?atom,?integer,?integer,?atom,?integer) -
zero_or_more
```

---

clause/5

Enumerates, by backtracking, all collected clause profiling data.

Compilation flags:

```
dynamic
```

Template:

```
clause(Entity,Functor,Arity,ClauseNumber,Count)
```

Mode and number of proofs:

```
clause(?entity_identifier,?atom,?integer,?integer,?integer) - zero_or_more
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

clause_location_/6

Internal table of collected profiled clause location data.

Compilation flags:
`dynamic`

Template:
`clause_location_(Entity,Functor,Arity,ClauseNumber,File,BeginLine)`
Mode and number of proofs:
`clause_location_(?entity_identifier,?atom,?integer,?integer,?atom,?integer)` - `zero_or_more`

---

port_/5

Internal table of collected port profiling data.

Compilation flags:
`dynamic`

Template:
`port_(Port,Entity,Functor,Arity,Count)`
Mode and number of proofs:
`port_(?atom,?entity_identifier,?atom,?integer,?integer)` - `zero_or_more`

---

clause_/5

Internal table of collected clause profiling data.

Compilation flags:
`dynamic`

Template:
`clause_(Entity,Functor,Arity,ClauseNumber,Count)`
Mode and number of proofs:
`clause_(?entity_identifier,?atom,?integer,?integer,?integer)` - `zero_or_more`

---

entity_defines_/2

Internal cache for profiled predicates.

Compilation flags:
`dynamic`

Template:
`entity_defines_(Entity,Predicate)`
Mode and number of proofs:
`entity_defines_(?entity_identifier,?predicate_indicator)` - `zero_or_more`

Operators

(none)

1.261 prefix_span_pattern_miner

object

1.261.1 prefix_span_pattern_miner

PrefixSpan sequential pattern miner for sequence datasets using recursive projected databases.

Availability:
`logtalk_load(prefix_span_pattern_miner(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-05-06

Compilation flags:

(none)

- *Public predicates*
  - *decode/6*
  - *valid_result/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

decode/6

Decodes a complete output document and process metadata. Nonzero status and malformed output raise problog_solver_error/4 retaining both output streams.

Compilation flags:

```
static
```

Template:

```
decode(Codes,Diagnostics,RawStatus,NormalizedStatus,SourceMap,Result)
```

Mode and number of proofs:

```
decode(+list(integer),+list(integer),+term,+compound,+list(compound),-compound) -
one_or_error
```

---

valid_result/1

True for a ground, structurally valid collected inference result.

Compilation flags:

```
static
```

Template:

```
valid_result(Result)
```

Mode and number of proofs:

```
valid_result(@term) - zero_or_one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

protocol

1.263.4 problog_problem_protocol

Protocol for ordered, ground ProbLog statement providers.

Availability:
`logtalk_load(problog(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-12

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *problog_statement/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

problog_statement/2

Enumerates canonical ProbLog statements in source order together with their source origins.

Compilation flags:
`static`

Template:
`problog_statement(Statement,Origin)`
Mode and number of proofs:
`problog_statement(-compound,-term)` - `zero_or_more`

Remarks:

- Statements: Statements are fully ground and use the vocabulary documented by the `problog_program` object.
- Origin: Either `unknown` or `source(File, Start, End)` where positions are positive character offsets.

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
object

1.263.5 problog_process

Isolated operating-system shell transport for the ProbLog CLI.

Availability:
`logtalk_load(problog(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-12

Compilation flags:
`static, context_switching_calls`

Uses:
list
os
process
reader
type
utf_8

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *quote/3*
  - *run/7*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

quote/3

Quotes an atom as one POSIX shell or Windows PowerShell literal, without interpolation.

Compilation flags:

`static`

Template:

`quote(Platform,Argument,Quoted)`

Mode and number of proofs:

`quote(+atom,+atom,-atom)` - `one_or_error`

Exceptions:

`Platform` is a variable:

`instantiation_error`

`Platform` is neither a variable nor an atom:

`type_error(atom,Platform)`

`Platform` is an atom but neither `posix` nor `windows`:

`domain_error(problog_shell_platform,Platform)`

`Argument` is a variable:

`instantiation_error`

`Argument` is neither a variable nor an atom:

`type_error(atom,Argument)`

`Argument` is an atom but contains a null character:

`domain_error(problog_shell_argument,Argument)`

---

run/7

Runs the ProbLog CLI with an owned temporary source and separate UTF-8 output captures, returning only after cleanup.

Compilation flags:

`static`

Template:

`run(Executable,Arguments,ProgramSource,Codes,Diagnostics,RawStatus,NormalizedStatus)`

Mode and number of proofs:

`run(+atom,+list(atom),+compound,-list(code),-list(code),-term,-compound)` - `one_or_error`

Exceptions:

`Executable` is a variable:

`instantiation_error`

`Executable` is neither a variable nor an atom:

`type_error(atom,Executable)`

`Arguments` is a partial list or a list with an element `Argument` which is a variable:

`instantiation_error`

`Arguments` is neither a variable nor a list:

`type_error(list(atom),Arguments)`

An element `Argument` of the list `Arguments` is neither a variable nor an atom:

`type_error(atom,Argument)`

`Executable` or an element `Argument` of the list `Arguments` contains a null character:

`domain_error(problog_shell_argument,Argument)`

`ProgramSource` is not a ground term:

`instantiation_error`

`ProgramSource` is neither `file(Path)` nor `codes(Codes)`:

`domain_error(problog_process_source,ProgramSource)`

A launcher dependency does not exist:

`existence_error(command,Command)`

A source or capture file does not exist:

`existence_error(source_sink,Path)`

A source or capture file cannot be opened:

`permission_error(open,source_sink,Path)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

`problog_transport(Stage,Status,Details)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

object

1.263.6 `problog_program`

Canonical ground ProbLog statement validation and source generation.

Availability:

`logtalk_load(problog(loader))`

Author: Paulo Moura
Version: 1:0:0

Date: 2026-11-15

Compilation flags:
`static, context_switching_calls`

Uses:
list
type

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *serialize/2*
  - *serialize/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

serialize/2

Serializes a list of fully ground canonical ProbLog statements to character codes.

Compilation flags:
`static`

Template:
`serialize(Statements,Codes)`

Mode and number of proofs:
`serialize(+list,-list(integer))` - `one_or_error`

Exceptions:
`Statements` is a partial list or contains a variable:
`instantiation_error`
`Statements` is not a list:
`type_error(list,Statements)`
A statement or one of its terms is outside the documented ProbLog AST:
`domain_error(problog_statement,Statement)`

Remarks:

- Statements: The statement constructors are `fact(Head)`, `rule(Head, Body)`, `probabilistic_fact(P, Head)`, `probabilistic_rule(P, Head, Body)`, `annotated_disjunction(Alternatives, Body)`, `query(Goal)`, `evidence(Goal, Boolean)`, `directive(Goal)`, `comment(Codes)`, and `raw(Codes)`.

- Heads and positive goals: Use `function(Name, Arguments)`; a zero-arity predicate has an empty argument list. Terms are `atom(Atom)`, `number(Number)`, `variable(Name)`, `anonymous`, nested `function(Name, Arguments)`, proper `list(Elements)`, improper `list(Elements, Tail)`, and `arithmetic(Operator, Arguments)`. Logic variables are represented by ground `variable(Name)` or `anonymous` nodes, preserving variable sharing without putting Prolog variables in the AST.
- Goals: Use `true`, `function(Name, Arguments)`, `conjunction(Goals)`, `disjunction(Goals)`, `negation(Goal)`, or `comparison(Operator, Left, Right)`. Arithmetic operators are `+`, `-`, `*`, `/`, `//`, `mod`, and `**`; comparison operators are `=`, `==`, `\=`, `\==`, `<`, `=<`, `>`, and `>=`.
- Queries and evidence: `query(Goal)` writes a native query directive; `evidence(Goal, true)` and `evidence(Goal, false)` write positive and negative evidence directives.
- Annotated disjunctions: `annotated_disjunction(Alternatives, Body)` uses at least two `Probability-Head` list elements and writes `Probability::Head; ...` optionally followed by `:- Body`.
- Raw source and comments: `raw(Codes)` passes trusted native source through, adding a final newline when needed. `comment(Codes)` emits comment lines. Both use ground character-code lists.
- Probabilities: Probabilities are numbers in the inclusive range [0,1]. Annotated-disjunction probabilities must sum to at most one; a residual probability is allowed.

`serialize/4`

Serializes statements with origins and returns generated `line(Start, End, Origin)` source-map entries.

Compilation flags:

`static`

Template:

`serialize(Statements,Origins,Codes,SourceMap)`

Mode and number of proofs:

`serialize(+list,+list,-list(integer),-list(compound))` - `one_or_error`

Exceptions:

`Statements` or `Origins` is a partial list or contains a variable:

`instantiation_error`

`Statements` or `Origins` is not a list:

`type_error(list,Statements)`

An invalid statement or origin is supplied, or the list lengths differ:

`domain_error(problog_origins,Origins)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.263.7 problog_protocol

Process-backed ProbLog exact inference, source generation, and collected query probabilities.

Availability:
`logtalk_load(problog(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-14

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Operators*

Public predicates

solve/2

Runs exact inference with default options. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`. Returns a ground collected result after cleanup.

Compilation flags:
`static`

Template:
`solve(Source,Result)`
Mode and number of proofs:
`solve(+compound,-compound)` - `one_or_error`

Exceptions:
`Source` is not ground:
`instantiation_error`
`Source` is ground but invalid:
`domain_error(problog_source,Source)`
An executable cannot be resolved:
`existence_error(command,Command)`
A transport operation fails:
`problog_transport(Stage,Status,Details)`
Inference fails or produces invalid output:
`problog_solver_error(Formal,Status,Diagnostics,SourceMap)`

---

solve/3

Runs exact inference with the given options options. Repeated options use the first occurrence.

Compilation flags:
`static`

Template:
`solve(Source,Result,Options)`
Mode and number of proofs:
`solve(+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Source` is not ground:
`instantiation_error`
`Source` is ground but invalid:
`domain_error(problog_source,Source)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
An executable cannot be resolved:
`existence_error(command,Command)`
A transport operation fails:
`problog_transport(Stage,Status,Details)`
Inference fails or produces invalid output:
`problog_solver_error(Formal,Status,Diagnostics,SourceMap)`

---

program/1

Prints source to the current output without invoking ProbLog.

Compilation flags:
`static`

Template:
`program(Source)`
Mode and number of proofs:
`program(+compound)` - `one_or_error`

Exceptions:
`Source` is not ground:
`instantiation_error`
`Source` is ground but invalid:
`domain_error(problog_source,Source)`

---

program/2

Returns source character codes without invoking ProbLog. Native file and codes sources are not parsed.

Compilation flags:
`static`

Template:
`program(Source,Codes)`
Mode and number of proofs:
`program(+compound,-list(integer))` - `one_or_error`

Exceptions:

`Source` is not ground:
`instantiation_error`
`Source` is ground but invalid:
`domain_error(problog_source,Source)`

`print_program/1`

Prints character codes to the current output without adding a newline.

Compilation flags:
`static`

Template:
`print_program(Codes)`
Mode and number of proofs:
`print_program(+list(integer))` - `one_or_error`

Exceptions:
`Codes` is a partial list or a list with an element `Element` which is a variable:
`instantiation_error`
`Codes` is is neither a partial list nor a list:
`type_error(codes,Codes)`
An element `Element` of the `Codes` list is neither a variable nor an integer:
`type_error(integer,Element)`
An element `Element` of the `Codes` list is an integer but not a valid character code:
`domain_error(character_code,Element)`

`probability/3`

Enumerates ground query terms and numeric probabilities in a collected result. Query order follows the CLI, not a sorting contract.

Compilation flags:
`static`

Template:
`probability(Result,Query,Probability)`
Mode and number of proofs:
`probability(+compound,?callable,?number)` - `zero_or_more`

Exceptions:
`Result` is not ground:
`instantiation_error`
`Result` is ground but invalid:
`domain_error(problog_result,Result)`

---

result_property/2

Enumerates raw_status/1, process_status/1, and diagnostics/1 properties. Diagnostics are captured stderr character codes.

Compilation flags:
static

Template:
result_property(Result,Property)
Mode and number of proofs:
result_property(+compound,?compound) - zero_or_more

---

print_result/1

Prints the collected query probabilities without invoking ProbLog.

Compilation flags:
static

Template:
print_result(Result)
Mode and number of proofs:
print_result(+compound) - one_or_error

Exceptions:
Result is not ground:
instantiation_error
Result is ground but invalid:
domain_error(problog_result,Result)

Protected predicates

1.264 process

object

1.264.1 `process`

Portable process handling predicates.

Availability:
`logtalk_load(process(loader))`

Author: Paulo Moura
Version: 2:4:0
Date: 2026-11-12

Compilation flags:
`static, context_switching_calls`

Dependencies:
(none)

Remarks:

- Supported backend Prolog systems: ECLiPSe, GNU Prolog, SICStus Prolog, Shumway Prolog, SWI-Prolog, Trealla Prolog, and XVM.
- Option `type/1` limitation: This option is ignored on ECLiPSe, GNU Prolog, and XVM.

Inherited public predicates:
(none)

- *Public predicates*
  - *create/3*
  - *wait/2*
  - *wait/3*
  - *kill/2*
  - *kill/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

create/3

Creates a new process from the given executable and list of arguments. Supported options are `process(Pid)`, `stdin(Stream)`, `stdout(Stream)`, `stderr(Stream)`, and `type(Type)`.

Compilation flags:

`static`

Template:

`create(Executable,Arguments,Options)`

Mode and number of proofs:

`create(+atom,+list(atom),+list(compound))` - `zero_or_one`

---

wait/2

Waits for a process to terminate and retrieves its exit status. The value of `Status` depends on the backend. For a successfully terminated process, `Status` is either `0` or `exit(0)`.

Compilation flags:

`static`

Template:

`wait(Pid,Status)`

Mode and number of proofs:

`wait(+integer,-integer_or_compound)` - `one`

---

wait/3

Waits once for a process to terminate, returning the backend-specific status in `RawStatus` and its normalized form in `NormalizedStatus`.

Compilation flags:

`static`

Template:

`wait(Pid,RawStatus,NormalizedStatus)`

Mode and number of proofs:

`wait(+integer,-integer_or_compound,-compound)` - `one`

Remarks:

- Normalized status: Either `exit(Code)`, `killed(Signal)`, or `unknown(RawStatus)` when native information is insufficient.
- GNU Prolog limitation: No distinction between processes that exited on their own with non-zero status and processes that were killed.

---

kill/2

Kills the given process with the specified signal (an integer or one of the following atoms: `sighup`, `sigint`, `sigkill`, or `sigterm`).

Compilation flags:
`static`

Template:
`kill(Pid,Signal)`
Mode and number of proofs:
`kill(+integer,+atom_or_integer)` - `zero_or_one`

---

kill/1

Kills the given process using the default signal (`sigkill`).

Compilation flags:
`static`

Template:
`kill(Pid)`
Mode and number of proofs:
`kill(+integer)` - `zero_or_one`

1.265 protobuf

object

1.265.1 `protobuf`

Google Protocol Buffers binary format parser and generator.

Availability:
`logtalk_load(protobuf(loader))`

Author: Paulo Moura
Version: 1:2:0
Date: 2026-08-04

Compilation flags:
`static, context_switching_calls`

Uses:
byte_order
ieee_754(Precision,ByteOrder,NaNRepresentation)
json(ObjectRepresentation,PairRepresentation,StringRepresentation)
list
reader

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *parse/2*
  - *parse/3*
  - *generate/3*
  - *generate/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

parse/2

Parses Protocol Buffers binary data from the given source (`bytes(List)`, `stream(Stream)`, or `file(Path)`) returning a `Schema-Data` pair. When the schema is not present in the file, `Schema` is unified with `false`.

Compilation flags:
`static`

Template:
`parse(Source,Schema-Data)`
Mode and number of proofs:
`parse(++compound,--pair)` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid Protocol Buffers source term:
`domain_error(protobuf_source,Source)`
`Schema` is not a valid Protocol Buffers schema for the encoded message:
`domain_error(protobuf_schema,Schema)`

---

parse/3

Parses Protocol Buffers binary data from the given source using the provided schema, returning the decoded data.

Compilation flags:
`static`

Template:
`parse(Source,Schema,Data)`
Mode and number of proofs:
`parse(++compound,++term,--term)` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid Protocol Buffers source term:
`domain_error(protobuf_source,Source)`
`Schema` is not a valid Protocol Buffers schema for the encoded message:
`domain_error(protobuf_schema,Schema)`

---

generate/3

Generates Protocol Buffers binary data to the given sink (`bytes(List)`, `stream(Stream)`, or `file(Path)`) from the given schema and data. The schema is not included in the output.

Compilation flags:

`static`

Template:

`generate(Sink,Schema,Data)`

Mode and number of proofs:

`generate(++compound,++term,++term)` - `one_or_error`

Exceptions:

`Sink` is a variable:

`instantiation_error`

`Sink` is neither a variable nor a valid Protocol Buffers sink term:

`domain_error(protobuf_sink,Sink)`

`Schema` is not a valid Protocol Buffers schema for `Data`:

`domain_error(protobuf_schema,Schema)`

---

generate/4

Generates Protocol Buffers binary data to the given sink from the given schema and data. When `IncludeSchema` is `true`, the schema is embedded in a wrapper message.

Compilation flags:

`static`

Template:

`generate(Sink,IncludeSchema,Schema,Data)`

Mode and number of proofs:

`generate(++compound,++boolean,++term,++term)` - `one_or_error`

Exceptions:

`Sink` is a variable:

`instantiation_error`

`Sink` is neither a variable nor a valid Protocol Buffers sink term:

`domain_error(protobuf_sink,Sink)`

`Schema` is not a valid Protocol Buffers schema for `Data`:

`domain_error(protobuf_schema,Schema)`

Public predicates

empty/1

True if the queue is empty.

Compilation flags:
`static`

Template:
`empty(Queue)`

Mode and number of proofs:
`empty(@queue)` - `zero_or_one`

head/2

Unifies `Head` with the first element of the queue.

Compilation flags:
`static`

Template:
`head(Queue,Head)`
Mode and number of proofs:
`head(+queue,?term)` - `zero_or_one`

---

join/3

Adds the new element at the end of the queue.

Compilation flags:
`static`

Template:
`join(Element,Queue,NewQueue)`
Mode and number of proofs:
`join(@term,+queue,-queue)` - `zero_or_one`

---

join_all/3

Adds the new elements at the end of the queue. The elements are added in the same order that they appear in the list.

Compilation flags:
`static`

Template:
`join_all(List,Queue,NewQueue)`
Mode and number of proofs:
`join_all(+list,+queue,-queue)` - `zero_or_one`

---

jump/3

Adds the new element at the front of the queue.

Compilation flags:
`static`

Template:
`jump(Element,Queue,NewQueue)`
Mode and number of proofs:
`jump(@term,+queue,-queue)` - `zero_or_one`

---

jump_all/3

Adds the new elements at the front of the queue. The last element in the list will be at the front of the queue.

Compilation flags:
`static`

Template:
`jump_all(Elements,Queue,NewQueue)`
Mode and number of proofs:
`jump_all(+list,+queue,-queue)` - `zero_or_one`

---

jump_all_block/3

Adds the new elements as a block at the front of the queue. The first element in the list will be at the front of the queue.

Compilation flags:
`static`

Template:
`jump_all_block(Elements,Queue,NewQueue)`
Mode and number of proofs:
`jump_all_block(+list,+queue,-queue)` - `zero_or_one`

---

append/3

Appends two queues. The new queue will have the elements of the first queue followed by the elements of the second queue.

Compilation flags:
`static`

Template:
`append(Queue1,Queue2,NewQueue)`
Mode and number of proofs:
`append(+queue,+queue,-queue)` - `one`

---

length/2

Queue length.

Compilation flags:
`static`

Template:
`length(Queue,Length)`
Mode and number of proofs:
`length(+heap,?integer)` - `zero_or_one`

---

serve/3

Removes the first element of the queue for service.

Compilation flags:
`static`

Template:
`serve(Queue,Head,NewQueue)`
Mode and number of proofs:
`serve(+queue,?term,-queue)` - `zero_or_one`

---

as_list/2

Converts a queue to a list.

Compilation flags:
```
static
```

Template:
```
as_list(Queue,List)
```
Mode and number of proofs:
```
as_list(+queue,-list) - one
```

---

map/2

Applies a closure to all elements of a queue.

Compilation flags:
```
static
```

Template:
```
map(Closure,Queue)
```
Meta-predicate template:
```
map(1,*)
```
Mode and number of proofs:
```
map(+callable,+queue) - zero_or_one
```

---

map/3

Applies a closure to all elements of a queue constructing a new queue.

Compilation flags:
```
static
```

Template:
```
map(Closure,Queue,NewQueue)
```
Meta-predicate template:
```
map(2,*,*)
```
Mode and number of proofs:
```
map(+callable,+queue,?queue) - zero_or_one
```

1.268 random

object

1.268.1 `backend_random`

Random number generator predicates using the backend Prolog compiler built-in random generator.

Availability:
`logtalk_load(random(loader))`

Author: Paulo Moura
Version: 1:25:0
Date: 2026-10-28

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *pseudo_random_protocol*
`public` *sampling_protocol*
Uses:
list

Remarks:

- Implementation: The backend Prolog compiler built-in random generator is only used for the basic `random/1`, `get_seed/1`, and `set_seed/1` predicates.
- Portability: B-Prolog, CxProlog, ECLiPSe, JIProlog, Qu-Prolog, and Quintus Prolog do not provide implementations for the `get_seed/1` and `set_seed/1` predicates and calling these predicates simply succeed without performing any action.

Inherited public predicates:
bernoulli/2 beta/3 between/3 binomial/3 chi_squared/2 circular_uniform_cartesian/3 circular_uniform_polar/3 dirichlet/2 enumerate/2 exponential/2 fisher/3 gamma/3 geometric/2 get_seed/1 gumbel/3 hypergeometric/4 logistic/3 lognormal/3 logseries/2 maybe/0 maybe/1 maybe/2 maybe_call/1 maybe_call/2 member/2 normal/3 permutation/2

poisson/2 *power/2* *random/1* *random/3* *randseq/4* *randset/4* *sample/3* *sample/4* *select/3* *select/4* *sequence/4* *set/4* *set_seed/1* *standard_cauchy/3* *standard_exponential/1* *standard_gamma/2* *standard_normal/1* *standard_t/2* *swap/2* *swap_consecutive/2* *triangular/4* *uniform/1* *uniform/3* *von_mises/3* *wald/3* *weibull/3*

random, *fast_random*

object

1.268.2 `fast_random`

Portable random number generator predicates. Core predicates originally written by Richard O'Keefe. Based on algorithm AS 183 from Applied Statistics.

Availability:

```
logtalk_load(random(loader))
```

Author: Paulo Moura
Version: 3:0:0
Date: 2026-01-25

Compilation flags:

```
static, context_switching_calls
```

Extends:

```
public fast_random(as183)
```

Remarks:

- Single random number generator: This object provides a faster version of the `random` library object but does not support being extended to define multiple random number generators.
- Randomness: Loading this object always initializes the random generator seed to the same value, thus providing a pseudo random number generator. The `randomize/1` predicate can be used to initialize the seed with a random value.

Inherited public predicates:

bernoulli/2 beta/3 between/3 binomial/3 chi_squared/2 circular_uniform_cartesian/3 circular_uniform_polar/3 dirichlet/2 enumerate/2 exponential/2 fisher/3 gamma/3 geometric/2 get_seed/1 gumbel/3 hypergeometric/4 logistic/3 lognormal/3 logseries/2 maybe/0 maybe/1 maybe/2 maybe_call/1 maybe_call/2 member/2 normal/3 permutation/2 poisson/2 power/2 random/1 random/3 randomize/1 randseq/4 randset/4 reset_seed/0 sample/3 sample/4 select/3 select/4 sequence/4 set/4 set_seed/1 standard_cauchy/3 standard_exponential/1 standard_gamma/2 standard_normal/1 standard_t/2 swap/2 swap_consecutive/2 triangular/4 uniform/1 uniform/3 von_mises/3 wald/3 weibull/3

fast_random, *random*, *random(Algorithm)*, *backend_random*

object

1.268.3 `fast_random(Algorithm)`

- `Algorithm` - Random number generator algorithm. One of `as183`, `splitmix64`, `xoshiro128pp`, `xoshiro128ss`, `xoshiro256pp`, `xoshiro256ss`, `well512a`.

Fast portable random number generator predicates.

Availability:

`logtalk_load(random(loader))`

Author: Paulo Moura

Version: 3:2:0
Date: 2026-10-16

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *pseudo_random_protocol*
`public` *sampling_protocol*

Uses:
list

Remarks:

- Single random number generator: This object provides a faster version of the `random` library object but does not support being extended to define multiple random number generators.
- Randomness: Loading this object always initializes the random generator seed to the same value, thus providing a pseudo random number generator. The `randomize/1` predicate can be used to initialize the seed with a random value.
- `as183`: Algorithm AS 183 from Applied Statistics. 32-bit PRNG with period 2^60. Not cryptographically secure.
- `xoshiro128pp`: Xoshiro128++ random number generator. 32-bit state-of-the-art PRNG with period 2^128-1. Algorithm by David Blackman and Sebastiano Vigna.
- `xoshiro128ss`: Xoshiro128** random number generator. 32-bit PRNG with period 2^128-1. Algorithm by David Blackman and Sebastiano Vigna.
- `xoshiro256pp`: Xoshiro256++ random number generator. 64-bit state-of-the-art PRNG with period 2^256-1. Algorithm by David Blackman and Sebastiano Vigna.
- `xoshiro256ss`: Xoshiro256** random number generator. 64-bit PRNG with period 2^256-1. Algorithm by David Blackman and Sebastiano Vigna.
- `splitmix64`: SplitMix64 random number generator. 64-bit PRNG primarily used for seeding other generators. Algorithm by Guy L. Steele Jr. et al.
- `well512a`: WELL512a 16x32-bit state-of-the-art PRNG with period 2^512-1. Algorithm by by François Panneton, Pierre L'Ecuyer, and Makoto Matsumoto.
- Algorithms backend compatibility: The SplitMix64, Xoshiro256++, and Xoshiro256** algorithms require support for unbound integer arithmetic.

Inherited public predicates:
bernoulli/2 beta/3 between/3 binomial/3 chi_squared/2 circular_uniform_cartesian/3 circular_uniform_polar/3 dirichlet/2 enumerate/2 exponential/2 fisher/3 gamma/3 geometric/2 get_seed/1 gumbel/3 hypergeometric/4 logistic/3 lognormal/3 logseries/2 maybe/0 maybe/1 maybe/2 maybe_call/1 maybe_call/2 member/2 normal/3 permutation/2 poisson/2 power/2 random/1 random/3 randseq/4 randset/4 sample/3 sample/4 select/3 select/4 sequence/4 set/4 set_seed/1 standard_cauchy/3 standard_exponential/1 standard_gamma/2 standard_normal/1 standard_t/2 swap/2 swap_consecutive/2 triangular/4 uniform/1 uniform/3 von_mises/3 wald/3 weibull/3

- *Public predicates*
  - *reset_seed/0*
  - *randomize/1*
- *Protected predicates*
- *Private predicates*
  - *seed_/2*
- *Operators*

Public predicates

reset_seed/0

Resets the random generator seed to its default value. Use `get_seed/1` and `set_seed/1` instead if you need reproducibility.

Compilation flags:
`static, synchronized`

Mode and number of proofs:
`reset_seed` - `one`

---

randomize/1

Randomizes the random generator using a positive integer to compute a new seed. Use of a large integer is recommended. In alternative, when using a small integer argument, discard the first dozen random values.

Compilation flags:
`static, synchronized`

Template:
`randomize(Seed)`
Mode and number of proofs:
`randomize(+positive_integer)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

seed_/2

Stores the current random generator seed values (a ground but otherwise opaque term).

Compilation flags:
`dynamic`

Template:
`seed_(Algorithm,Seed)`
Mode and number of proofs:
`seed_(+atom,-ground)` - `one`

Operators

(none)

See also

fast_random, *random(Algorithm)*, *random*, *backend_random*

protocol

1.268.4 pseudo_random_protocol

Pseudo-random number generator protocol for seed handling predicates. These predicates are declared as synchronized when the library is compiled using a backend supporting threads.

Availability:
`logtalk_load(random(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2021-02-21

Compilation flags:
`static`

Extends:
`public` *random_protocol*

Remarks:
(none)

Inherited public predicates:

Public predicates

get_seed/1

Gets the current random generator seed. Seed should be regarded as an opaque ground term.

Compilation flags:
`static, synchronized`

Template:
`get_seed(Seed)`
Mode and number of proofs:
`get_seed(-ground)` - `one`

---

set_seed/1

Sets the random generator seed to a given value returned by calling the `get_seed/1` predicate.

Compilation flags:
`static, synchronized`

Template:
`set_seed(Seed)`
Mode and number of proofs:
`set_seed(+ground)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

random, *backend_random*, *fast_random*

object

1.268.5 `random`

Portable random number generator predicates. Core predicates originally written by Richard O'Keefe. Based on algorithm AS 183 from Applied Statistics.

Availability:

```
logtalk_load(random(loader))
```

Author: Paulo Moura
Version: 3:0:0
Date: 2026-01-24

Compilation flags:

```
static, context_switching_calls
```

Extends:

`public` *random(as183)*

Remarks:

- Multiple random number generators: To define multiple random number generators, simply extend this object. The derived objects must send to *self* the `reset_seed/0` message.
- Randomness: Loading this object always initializes the random generator seed to the same value, thus providing a pseudo random number generator. The `randomize/1` predicate can be used to initialize the seed with a random value.

Inherited public predicates:

bernoulli/2 beta/3 between/3 binomial/3 chi_squared/2 circular_uniform_cartesian/3 circular_uniform_polar/3 dirichlet/2 enumerate/2 exponential/2 fisher/3 gamma/3 geometric/2 get_seed/1 gumbel/3 hypergeometric/4 logistic/3 lognormal/3 logseries/2 maybe/0 maybe/1 maybe/2 maybe_call/1 maybe_call/2 member/2 normal/3 permutation/2 poisson/2 power/2 random/1 random/3 randomize/1 randseq/4 randset/4 reset_seed/0 sample/3 sample/4 select/3 select/4 sequence/4 set/4 set_seed/1 standard_cauchy/3 standard_exponential/1 standard_gamma/2 standard_normal/1 standard_t/2 swap/2 swap_consecutive/2 triangular/4 uniform/1 uniform/3 von_mises/3 wald/3 weibull/3

fast_random, *backend_random*

object

1.268.6 `random(Algorithm)`

- `Algorithm` - Random number generator algorithm. One of `as183`, `splitmix64`, `xoshiro128pp`, `xoshiro128ss`, `xoshiro256pp`, `xoshiro256ss`, `well512a`.

Portable random number generator predicates.

Availability:
`logtalk_load(random(loader))`

Author: Paulo Moura
Version: 3:2:0
Date: 2026-10-16

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *pseudo_random_protocol*
`public` *sampling_protocol*
Uses:
list

Remarks:

- Multiple random number generators: To define multiple random number generators, simply extend this object. The derived objects must send to *self* the `reset_seed/0` message.
- Randomness: Loading this object always initializes the random generator seed to the same value, thus providing a pseudo random number generator. The `randomize/1` predicate can be used to initialize the seed with a random value.
- `as183`: Algorithm AS 183 from Applied Statistics. 32-bit PRNG with period 2^60. Not cryptographically secure.
- `xoshiro128pp`: Xoshiro128++ random number generator. 32-bit state-of-the-art PRNG with period 2^128-1. Algorithm by David Blackman and Sebastiano Vigna.

- `xoshiro128ss`: Xoshiro128** random number generator. 32-bit PRNG with period 2^128-1. Algorithm by David Blackman and Sebastiano Vigna.
- `xoshiro256pp`: Xoshiro256++ random number generator. 64-bit state-of-the-art PRNG with period 2^256-1. Algorithm by David Blackman and Sebastiano Vigna.
- `xoshiro256ss`: Xoshiro256** random number generator. 64-bit PRNG with period 2^256-1. Algorithm by David Blackman and Sebastiano Vigna.
- `splitmix64`: SplitMix64 random number generator. 64-bit PRNG primarily used for seeding other generators. Algorithm by Guy L. Steele Jr. et al.
- `well512a`: WELL512a 16x32-bit state-of-the-art PRNG with period 2^512-1. Algorithm by by François Panneton, Pierre L'Ecuyer, and Makoto Matsumoto.
- Algorithms backend compatibility: The SplitMix64, Xoshiro256++, and Xoshiro256** algorithms require support for unbound integer arithmetic.

Inherited public predicates:

- *Operators*

Public predicates

reset_seed/0

Resets the random generator seed to its default value. Use `get_seed/1` and `set_seed/1` instead if you need reproducibility.

Compilation flags:

`static, synchronized`

Mode and number of proofs:

`reset_seed` - `one`

randomize/1

Randomizes the random generator using a positive integer to compute a new seed. Use of a large integer is recommended. In alternative, when using a small integer argument, discard the first dozen random values.

Compilation flags:

```
static, synchronized
```

Template:

```
randomize(Seed)
```

Mode and number of proofs:

```
randomize(+positive_integer) - one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

seed_/2

Stores the current random generator seed (a ground but otherwise opaque term).

Compilation flags:

```
dynamic
```

Template:

```
seed_(Algorithm,Seed)
```

Mode and number of proofs:

```
seed_(+atom,-ground) - one
```

Operators

(none)

Public predicates

random/1

Returns a new random float value in the interval `[0.0, 1.0[`.

Compilation flags:
`static, synchronized`

Template:
`random(Random)`
Mode and number of proofs:
`random(-float)` - `one`

---

between/3

Returns a new random integer in the interval `[Lower, Upper]`. Fails if `Lower` or `Upper` are not integers or if `Lower > Upper`.

Compilation flags:
`static`

Template:
`between(Lower,Upper,Random)`
Mode and number of proofs:
`between(+integer,+integer,-integer)` - `zero_or_one`

---

member/2

Returns a random member of a list. Fails if the list is empty.

Compilation flags:
`static`

Template:
`member(Random,List)`
Mode and number of proofs:
`member(-term,+list(term))` - `zero_or_one`

---

select/3

Returns a random member of a list and the rest of the list. Fails if the list is empty.

Compilation flags:
`static`

Template:
`select(Random,List,Rest)`
Mode and number of proofs:
`select(-term,+list(term),-list(term))` - `zero_or_one`

---

select/4

Returns a random member of a list, replacing it with a new element and returning the resulting list.

Compilation flags:
`static`

Template:
`select(Random,OldList,New,NewList)`
Mode and number of proofs:
`select(-term,+list(term),@term,-list(term))` - `zero_or_one`

---

swap/2

Swaps two randomly selected elements of a list. Fails if the list is empty or contains a single element.

Compilation flags:
`static`

Template:
`swap(OldList,NewList)`
Mode and number of proofs:
`swap(-term,+list(term))` - `zero_or_one`

---

swap_consecutive/2

Swaps two randomly selected consecutive elements of a list. Fails if the list is empty or contains a single element.

Compilation flags:
```
static
```

Template:
```
swap_consecutive(OldList,NewList)
```
Mode and number of proofs:
```
swap_consecutive(-term,+list(term)) - zero_or_one
```

---

enumerate/2

Enumerates the elements of a list in random order. Fails if the list is empty.

Compilation flags:
```
static
```

Template:
```
enumerate(List,Random)
```
Mode and number of proofs:
```
enumerate(+list(term),--term) - zero_or_more
```

---

sample/3

Returns a random sample without replacement, preserving source order and element identity. Returns the whole list when the requested size is at least its length.

Compilation flags:
```
static
```

Template:
```
sample(List,Size,Sample)
```
Mode and number of proofs:
```
sample(+list,+non_negative_integer,-list) - one
```

---

sample/4

Returns a random sample without replacement using the supplied list length, preserving source order and element identity. The supplied length must equal the actual list length and is not verified. Returns the whole list when the requested size is at least its length.

Compilation flags:

```
static
```

Template:

```
sample(List,Length,Size,Sample)
```

Mode and number of proofs:

```
sample(+list,+non_negative_integer,+non_negative_integer,-list) - one
```

---

permutation/2

Returns a random permutation of a list.

Compilation flags:

```
static, synchronized
```

Template:

```
permutation(List,Permutation)
```

Mode and number of proofs:

```
permutation(+list,-list) - one
```

---

sequence/4

Returns list of random integers of given length in random order in interval `[Lower, Upper]`. Fails if `Length`, `Lower`, or `Upper` are not integers or if `Lower > Upper`.

Compilation flags:

```
static, synchronized
```

Template:

```
sequence(Length,Lower,Upper,List)
```

Mode and number of proofs:

```
sequence(+integer,+integer,+integer,-list(integer)) - zero_or_one
```

---

set/4

Returns ordered set of random integers of given size in interval `[Lower, Upper]`. Fails if `Length`, `Lower`, or `Upper` are not integers, if `Lower > Upper`, or if `Length > Upper - Lower + 1`.

Compilation flags:

```
static, synchronized
```

Template:

```
set(Length,Lower,Upper,Set)
```

Mode and number of proofs:

```
set(+integer,+integer,+integer,-list(integer)) - zero_or_one
```

---

random/3

Returns a new random value in the interval `[Lower, Upper[`. Fails if `Lower > Upper`. Deprecated. Use `between/3` for integers.

Compilation flags:

```
static, synchronized
```

Template:

```
random(Lower,Upper,Random)
```

Mode and number of proofs:

```
random(+integer,+integer,-integer) - zero_or_one
random(+float,+float,-float) - zero_or_one
```

---

randseq/4

Returns list of random values of given length in random order in interval `[Lower, Upper[`. Fails if `Lower > Upper` or if the arguments are neither integers or floats. Deprecated. Use `sequence/4` for integers.

Compilation flags:

```
static, synchronized
```

Template:

```
randseq(Length,Lower,Upper,List)
```

Mode and number of proofs:

```
randseq(+integer,+integer,+integer,-list(integer)) - zero_or_one
randseq(+integer,+float,+float,-list(float)) - zero_or_one
```

---

randset/4

Returns ordered set of random values of given size in interval `[Lower, Upper[`. Fails if the arguments are neither integers or floats, `Lower > Upper`, or `Length > Upper - Lower` when arguments are integers. Deprecated. Use `set/4` for integers.

Compilation flags:

```
static, synchronized
```

Template:

```
randset(Length,Lower,Upper,Set)
```

Mode and number of proofs:

```
randset(+integer,+integer,+integer,-list(integer)) - zero_or_one
randset(+integer,+float,+float,-list(float)) - zero_or_one
```

---

maybe/0

Succeeds or fails with equal probability.

Compilation flags:

```
static
```

Mode and number of proofs:

```
maybe - zero_or_one
```

---

maybe/1

Succeeds with probability `Probability` or fails with probability `1 - Probability`. Fails if `Probability` is not a float or is outside the interval `[0.0, 1.0]`.

Compilation flags:

```
static
```

Template:

```
maybe(Probability)
```

Mode and number of proofs:

```
maybe(+probability) - zero_or_one
```

---

maybe/2

Succeeds with probability `K/N` where `K` and `N` are integers satisfying the equation `0 =< K =< N`. Fails otherwise.

Compilation flags:
`static`

Template:
`maybe(K,N)`
Mode and number of proofs:
`maybe(+non_negative_integer,+non_negative_integer)` - `zero_or_one`

---

maybe_call/1

Calls a goal or fails without calling it with equal probability. When the goal is called, it determines if this predicate succeeds once or fails.

Compilation flags:
`static`

Template:
`maybe_call(Goal)`
Meta-predicate template:
`maybe_call(0)`
Mode and number of proofs:
`maybe_call(+callable)` - `zero_or_one`

---

maybe_call/2

Calls a goal or fails without calling it with probability `Probability`. When the goal is called, it determines if this predicate succeeds once or fails.

Compilation flags:
`static`

Template:
`maybe_call(Probability,Goal)`
Meta-predicate template:
`maybe_call(*,0)`
Mode and number of proofs:
`maybe_call(+probability,+callable)` - `zero_or_one`

Public predicates

normal/3

Returns a scaled normally (Gaussian) distributed random value with the given mean and standard deviation.

Compilation flags:

```
static
```

Template:

```
normal(Mean,Deviation,Value)
```

Mode and number of proofs:

```
normal(+float,+non_negative_float,-float) - one
```

lognormal/3

Returns a scaled log normally distributed random value with the given mean and standard deviation for the normal distribution.

Compilation flags:

```
static
```

Template:

```
lognormal(Mean,Deviation,Value)
```

Mode and number of proofs:

```
lognormal(+float,+non_negative_float,-float) - one
```

---

wald/3

Returns a scaled Wald (inverse Gaussian) distributed random value with the given mean.

Compilation flags:

```
static
```

Template:

```
wald(Mean,Scale,Value)
```

Mode and number of proofs:

```
wald(+positive_float,+positive_float,-float) - one
```

---

chi_squared/2

Returns a chi-squared distributed random value given the degrees of freedom.

Compilation flags:

```
static
```

Template:

```
chi_squared(DegreesOfFreedom,Value)
```

Mode and number of proofs:

```
chi_squared(+positive_integer,-float) - one
```

---

fisher/3

Returns a Fisher distributed random value given the degrees of freedom in the numerator and in the denominator.

Compilation flags:
`static`

Template:
`fisher(DegreesOfFreedomNumerator,DegreesOfFreedomDenominator,Value)`
Mode and number of proofs:
`fisher(+positive_integer,+positive_integer,-float)` - `one`

---

logseries/2

Returns a logseries distributed random value. Requires `0.0 < Shape < 1` and fails otherwise.

Compilation flags:
`static`

Template:
`logseries(Shape,Value)`
Mode and number of proofs:
`logseries(+positive_float,-positive_integer)` - `zero_or_one`

---

geometric/2

Returns a geometric distributed random value (trials until the first success). Requires `0.0 < Probability =< 1.0` and fails otherwise.

Compilation flags:
`static`

Template:
`geometric(Probability,Value)`
Mode and number of proofs:
`geometric(+probability,-positive_integer)` - `zero_or_one`

---

hypergeometric/4

Returns a hypergeometric distributed random value. Requires `Successes =< Population` and `Draws =< Population` and fails otherwise.

Compilation flags:

`static`

Template:

`hypergeometric(Population,Successes,Draws,Value)`

Mode and number of proofs:

`hypergeometric(+non_negative_integer,+non_negative_integer,+non_negative_integer,-non_negative_integer)` - `zero_or_one`

---

exponential/2

Returns a scaled exponentially distributed random value.

Compilation flags:

`static`

Template:

`exponential(Scale,Value)`

Mode and number of proofs:

`exponential(+positive_float,-float)` - `one`

---

binomial/3

Returns a binomial distributed random value.

Compilation flags:

`static`

Template:

`binomial(Trials,Probability,Value)`

Mode and number of proofs:

`binomial(+non_negative_integer,+probability,-non_negative_integer)` - `one`

---

bernoulli/2

Returns a Bernoulli distributed random value.

Compilation flags:
`static`

Template:
`bernoulli(Probability,Value)`
Mode and number of proofs:
`bernoulli(+probability,-non_negative_integer)` - `one`

---

beta/3

Returns a beta distributed random value.

Compilation flags:
`static`

Template:
`beta(Alpha,Beta,Value)`
Mode and number of proofs:
`beta(+positive_float,+positive_float,-float)` - `one`

---

gamma/3

Returns a scaled gamma distributed random value.

Compilation flags:
`static`

Template:
`gamma(Shape,Scale,Value)`
Mode and number of proofs:
`gamma(+positive_float,+positive_float,-float)` - `one`

---

logistic/3

Returns a scaled logistic distributed random value.

Compilation flags:
```
static
```

Template:
```
logistic(Location,Scale,Value)
```
Mode and number of proofs:
```
logistic(+float,+positive_float,-float) - one
```

---

poisson/2

Returns a Poisson distributed random value given the expected number of events.

Compilation flags:
```
static
```

Template:
```
poisson(Mean,Value)
```
Mode and number of proofs:
```
poisson(+non_negative_float,-non_negative_integer) - one
```

---

power/2

Returns a power distributed random value.

Compilation flags:
```
static
```

Template:
```
power(Exponent,Value)
```
Mode and number of proofs:
```
power(+positive_float,-float) - one
```

---

weibull/3

Returns a scaled Weibull distributed random value.

Compilation flags:
`static`

Template:
`weibull(Shape,Scale,Value)`
Mode and number of proofs:
`weibull(+positive_float,+positive_float,-float)` - `one`

---

uniform/3

Returns a uniform distributed random value in the interval `[Lower, Upper[`. Fails if `Lower` or `Upper` are not floats or if `Lower > Upper`. Same as `random/3`.

Compilation flags:
`static`

Template:
`uniform(Lower,Upper,Value)`
Mode and number of proofs:
`uniform(+float,+float,-float)` - `zero_or_one`

---

uniform/1

Returns a uniform distributed random value in the interval `[0.0, 1.0[`. Same as `random/1`.

Compilation flags:
`static`

Template:
`uniform(Value)`
Mode and number of proofs:
`uniform(-float)` - `one`

---

triangular/4

Returns a triangular distributed random value. Returns `Left` when `Left`, `Mode`, and `Right` are equal. Fails if the `Left =< Mode =< Right` condition does not hold.

Compilation flags:
`static`

Template:
`triangular(Left,Mode,Right,Value)`
Mode and number of proofs:
`triangular(+float,+float,+float,-float)` - `zero_or_one`

---

von_mises/3

Returns a von Mises distributed random value.

Compilation flags:
`static`

Template:
`von_mises(Mode,Concentration,Value)`
Mode and number of proofs:
`von_mises(+float,+non_negative_float,-float)` - `one`

---

gumbel/3

Returns a Gumbel distributed random value. Fails if `Scale` is not positive.

Compilation flags:
`static`

Template:
`gumbel(Location,Scale,Value)`
Mode and number of proofs:
`gumbel(+float,+positive_float,-float)` - `one`

---

dirichlet/2

Returns a Dirichlet distributed list of random values.

Compilation flags:
`static`

Template:
`dirichlet(Alphas,Thetas)`
Mode and number of proofs:
`dirichlet(+list(positive_float),-list(positive_float))` - `one`

---

circular_uniform_polar/3

Returns a circular uniform distributed random point in polar coordinates given the circle radius.

Compilation flags:
`static`

Template:
`circular_uniform_polar(Radius,Rho,Theta)`
Mode and number of proofs:
`circular_uniform_polar(+non_negative_float,-float,-float)` - `one`

---

circular_uniform_cartesian/3

Returns a circular uniform distributed random point in cartesian coordinates given the circle radius.

Compilation flags:
`static`

Template:
`circular_uniform_cartesian(Radius,X,Y)`
Mode and number of proofs:
`circular_uniform_cartesian(+non_negative_float,-float,-float)` - `one`

---

standard_t/2

Returns a standard Student's t distributed random value given the degrees of freedom.

Compilation flags:
```
static
```

Template:
```
standard_t(DegreesOfFreedom,Value)
```
Mode and number of proofs:
```
standard_t(+positive_integer,-float) - one
```

---

standard_cauchy/3

Returns a standard Cauchy distributed random value.

Compilation flags:
```
static
```

Template:
```
standard_cauchy(Location,Scale,Value)
```
Mode and number of proofs:
```
standard_cauchy(+float,+positive_float,-float) - one
```

---

standard_exponential/1

Returns a standard exponential distributed random value.

Compilation flags:
```
static
```

Template:
```
standard_exponential(Value)
```
Mode and number of proofs:
```
standard_exponential(-float) - one
```

---

standard_gamma/2

Returns a standard gamma distributed random value.

Compilation flags:
`static`

Template:
`standard_gamma(Shape,Value)`
Mode and number of proofs:
`standard_gamma(+positive_float,-float)` - `one`

---

standard_normal/1

Returns a standard normally (Gaussian) distributed random value (using a default mean of 0.0 and a default deviation of 1.0).

Compilation flags:
`static`

Template:
`standard_normal(Value)`
Mode and number of proofs:
`standard_normal(-float)` - `one`

1.273 ranked_pairs

object

1.273.1 `ranked_pairs`

Ranked Pairs pairwise preference ranker. Learns one deterministic score per item from a dataset object implementing the `pairwise_ranking_dataset_protocol` protocol by locking direct pairwise victories in descending strength order while avoiding cycles and returns a self-describing ranker term with diagnostics that can be used for ranking and export.

Availability:

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

update_item_parameters/10

Computes the simultaneous Glicko-2 rating, deviation, and volatility update for one item over a rating period using the current dictionaries and aggregated game results.

Compilation flags:

```
static
```

Template:

```
update_item_parameters(Item,ItemResults,Ratings,Deviations,Volatilities,Tau,
VolatilityTolerance,UpdatedRating,UpdatedDeviation,UpdatedVolatility)
```

Mode and number of proofs:

```
update_item_parameters(+term,+list(compound),+compound,+compound,+compound,
+number,+number,-number,-number,-number) - one
```

---

to_mu/2

Converts a rating on the external Glicko scale to the internal `mu` scale.

Compilation flags:

```
static
```

Template:

```
to_mu(Rating,Mu)
```

Mode and number of proofs:

```
to_mu(+number,-number) - one
```

---

to_phi/2

Converts a rating deviation on the external Glicko scale to the internal `phi` scale.

Compilation flags:

```
static
```

Template:

```
to_phi(Deviation,Phi)
```

Mode and number of proofs:

```
to_phi(+number,-number) - one
```

---

to_rating/2

Converts a value on the internal mu scale back to the external Glicko rating scale.

Compilation flags:
static

Template:
to_rating(Mu,Rating)
Mode and number of proofs:
to_rating(+number,-number) - one

---

to_deviation/2

Converts a value on the internal phi scale back to the external Glicko rating-deviation scale.

Compilation flags:
static

Template:
to_deviation(Phi,Deviation)
Mode and number of proofs:
to_deviation(+number,-number) - one

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

update_strengths/4

Hook predicate that importing rankers must define to perform one synchronous strength-update iteration.

Compilation flags:

`static`

Template:

`update_strengths(Context,Strengths0,Strengths,MaximumDifference)`

Mode and number of proofs:

`update_strengths(+nonvar,+list(number),-list(number),-number)` - `one`

initial_strengths/2

Initializes a positive strength vector with a uniform value for each ordered item.

Compilation flags:

```
static
```

Template:

```
initial_strengths(Items,Strengths)
```

Mode and number of proofs:

```
initial_strengths(+list,-list(float)) - one
```

---

strength_pairs/3

Pairs ordered items with their learned strength values.

Compilation flags:

```
static
```

Template:

```
strength_pairs(Items,StrengthValues,Strengths)
```

Mode and number of proofs:

```
strength_pairs(+list,+list(number),-list(pair)) - one
```

---

optimize_strengths/8

Runs the iterative strength-update loop until convergence or the maximum iteration bound is reached.

Compilation flags:

```
static
```

Template:

```
optimize_strengths(MaximumIterations,Tolerance,UpdateContext,Strengths0,
Strengths,Status,Iterations,FinalDifference)
```

Mode and number of proofs:

```
optimize_strengths(+integer,+number,+nonvar,+list(number),-list(number),-atom,
-integer,-number) - one
```

---

strength_dictionary/2

Builds an index-addressable dictionary from an ordered list of strength values.

Compilation flags:
```
static
```

Template:
```
strength_dictionary(Strengths,Dictionary)
```
Mode and number of proofs:
```
strength_dictionary(+list(number),-compound) - one
```

---

require_strong_connectivity/4

Checks that the directed graph is strongly connected and throws a domain error with the strongly connected components otherwise.

Compilation flags:
```
static
```

Template:
```
require_strong_connectivity(Count,DirectedAdjacency,ReverseAdjacency,ErrorDomain)
```
Mode and number of proofs:
```
require_strong_connectivity(+integer,+compound,+compound,+atom) - one
```

---

strongly_connected/3

True when all indexed items are mutually reachable in both the forward and reverse adjacency graphs.

Compilation flags:
```
static
```

Template:
```
strongly_connected(Count,DirectedAdjacency,ReverseAdjacency)
```
Mode and number of proofs:
```
strongly_connected(+integer,+compound,+compound) - zero_or_one
```

`strongly_connected_components/4`

Computes the strongly connected components of the directed graph induced by the forward and reverse adjacency dictionaries.

Compilation flags:
`static`

Template:
`strongly_connected_components(Count,DirectedAdjacency,ReverseAdjacency,Components)`

Mode and number of proofs:
`strongly_connected_components(+integer,+compound,+compound,-list)` - `one`

Private predicates

(no local declarations; see entity ancestors if any)

Public predicates

item/1

Enumerates by backtracking the items that can be ranked.

Compilation flags:
```
static
```

Template:
```
item(Item)
```
Mode and number of proofs:
```
item(-atom) - zero_or_more
```

---

match/1

Enumerates by backtracking the matches in chronological processing order.

Compilation flags:
```
static
```

Template:
```
match(Match)
```
Mode and number of proofs:
```
match(-atom) - zero_or_more
```

---

team/3

Enumerates by backtracking the teams in a match and their non-negative ranks. Lower ranks are better and equal ranks denote a draw.

Compilation flags:
```
static
```

Template:
```
team(Match,Team,Rank)
```

Mode and number of proofs:
`team(-atom,-atom,-integer) - zero_or_more`

`team_member/4`

Enumerates by backtracking team members and their participation weights, which must be greater than zero and no greater than one.

Compilation flags:
`static`

Template:
`team_member(Match,Team,Item,Weight)`
Mode and number of proofs:
`team_member(-atom,-atom,-atom,-number) - zero_or_more`

strength_pairs/3

Pairs ordered items with their learned strength values.

Compilation flags:
`static`

Template:
`strength_pairs(Items,StrengthValues,Strengths)`
Mode and number of proofs:
`strength_pairs(+list,+list(number),-list(pair))` - `one`

---

index_items/3

Builds `Item-Index` pairs for the ordered training items.

Compilation flags:
`static`

Template:
`index_items(Items,Index,Indices)`
Mode and number of proofs:
`index_items(+list,+integer,-list(pair))` - `one`

---

preprocess_matchups/6

Builds directed adjacency, reverse adjacency, per-item win totals, and undirected pair-adjacency structures from aggregated pairwise matchups.

Compilation flags:

```
static
```

Template:

```
preprocess_matchups(Matchups,IndexDictionary,DirectedAdjacency,ReverseAdjacency,
WinWeights,PairAdjacency)
```

Mode and number of proofs:

```
preprocess_matchups(+list,+compound,-compound,-compound,-compound,-compound) - one
```

---

build_dataset_model/5

Materializes dense per-item win totals and weighted undirected adjacency lists from the sparse preprocessing dictionaries.

Compilation flags:

```
static
```

Template:

```
build_dataset_model(Count,WinWeights,PairAdjacency,PairWeights,Wins)
```

Mode and number of proofs:

```
build_dataset_model(+integer,+compound,+compound,-list,-list(number)) - one
```

---

require_strong_connectivity/4

Checks that the directed graph is strongly connected and throws a domain error with the strongly connected components otherwise.

Compilation flags:

```
static
```

Template:

```
require_strong_connectivity(Count,DirectedAdjacency,ReverseAdjacency,ErrorDomain)
```

Mode and number of proofs:

```
require_strong_connectivity(+integer,+compound,+compound,+atom) - one
```

---

strongly_connected/3

True when all indexed items are mutually reachable in both the forward and reverse adjacency graphs.

Compilation flags:
```
static
```

Template:
```
strongly_connected(Count,DirectedAdjacency,ReverseAdjacency)
```
Mode and number of proofs:
```
strongly_connected(+integer,+compound,+compound) - zero_or_one
```

---

strongly_connected_components/4

Computes the strongly connected components of the directed graph induced by the forward and reverse adjacency dictionaries.

Compilation flags:
```
static
```

Template:
```
strongly_connected_components(Count,DirectedAdjacency,ReverseAdjacency,
Components)
```
Mode and number of proofs:
```
strongly_connected_components(+integer,+compound,+compound,-list) - one
```

---

optimize_strengths/8

Runs the iterative strength-update loop until convergence or the maximum iteration bound is reached.

Compilation flags:
```
static
```

Template:
```
optimize_strengths(MaximumIterations,Tolerance,UpdateContext,Strengths0,
Strengths,Status,Iterations,FinalDifference)
```
Mode and number of proofs:
```
optimize_strengths(+integer,+number,+nonvar,+list(number),-list(number),-atom,
-integer,-number) - one
```

---

strength_dictionary/2

Builds an index-addressable dictionary from an ordered list of strength values.

Compilation flags:
```
static
```

Template:
```
strength_dictionary(Strengths,Dictionary)
```
Mode and number of proofs:
```
strength_dictionary(+list(number),-compound) - one
```

---

item_denominator/5

Accumulates the pairwise MM denominator for one item using the current strength dictionary and weighted neighbors.

Compilation flags:
```
static
```

Template:
```
item_denominator(Neighbors,StrengthDictionary,CurrentStrength,Denominator0,
Denominator)
```
Mode and number of proofs:
```
item_denominator(+list(pair),+compound,+number,+number,-number) - one
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

index_items/3

Builds `Item-Index` pairs for the ordered training items.

Compilation flags:
`static`

Template:
`index_items(Items,Index,Indices)`
Mode and number of proofs:
`index_items(+list,+integer,-list)` - `one`

preprocess_groups/10

Builds per-group choice steps, selection counts, and forward and reverse adjacency dictionaries from grouped rankings under the selected traversal order.

Compilation flags:

```
static
```

Template:

```
preprocess_groups(Order,Groups,Dataset,MissingRelevance,IndexDictionary,Count,
Steps,SelectionCounts,DirectedAdjacency,ReverseAdjacency)
```

Mode and number of proofs:

```
preprocess_groups(+atom,+list,+object_identifier,+atom,+compound,+integer,-list,
-list,-compound,-compound) - one
```

---

selection_exposures/4

Computes the per-item exposure counts implied by the grouped choice steps and the current value dictionary.

Compilation flags:

```
static
```

Template:

```
selection_exposures(Steps,SelectionCounts,ValueDictionary,ExposureCounts)
```

Mode and number of proofs:

```
selection_exposures(+list,+list,+compound,-list) - one
```

---

normalize_strengths/6

Normalizes raw strength values to sum to one while tracking the maximum absolute change from the current strengths.

Compilation flags:

```
static
```

Template:

```
normalize_strengths(RawStrengths,TotalRawStrength,CurrentStrengths,Strengths,
MaximumDifference0,MaximumDifference)
```

Mode and number of proofs:

```
normalize_strengths(+list(number),+number,+list(number),-list(number),+number,
-number) - one
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

ranker_scores_data/2

Hook predicate that importing ranker implementations must define in order to expose the learned item-score pairs on the ranker native numeric scale.

Compilation flags:

```
static
```

Template:

```
ranker_scores_data(Ranker,Scores)
```

Mode and number of proofs:

```
ranker_scores_data(+compound,-list(pair)) - one
```

---

ranker_diagnostics_data/2

Hook predicate that importing ranker implementations must define in order to expose diagnostics metadata.

Compilation flags:

```
static
```

Template:

```
ranker_diagnostics_data(Ranker,Diagnostics)
```

Mode and number of proofs:

```
ranker_diagnostics_data(+compound,-list(compound)) - one
```

---

ranker_export_template/4

Hook predicate that importing ranker implementations must define in order to expose the exported ranker template for a given functor.

Compilation flags:

```
static
```

Template:

```
ranker_export_template(Dataset,Ranker,Functor,Template)
```

Mode and number of proofs:

```
ranker_export_template(+object_identifier,+compound,+atom,-callable) - one
```

---

ranker_term_template/2

Hook predicate that importing ranker implementations must define in order to expose the learned ranker term template used by pretty-printing helpers.

Compilation flags:

```
static
```

Template:

```
ranker_term_template(Ranker,Template)
```

Mode and number of proofs:

```
ranker_term_template(+compound,-callable) - one
```

---

print_ranker_template/1

Pretty-printing helper predicate used by importing ranker implementations to show the learned ranker term template.

Compilation flags:

```
static
```

Template:

```
print_ranker_template(Ranker)
```

Mode and number of proofs:

```
print_ranker_template(+compound) - one
```

---

valid_ranker_metadata/2

True when the diagnostics list contains the expected model identifier, a valid effective options list, and a structurally valid dataset summary.

Compilation flags:

```
static
```

Template:

```
valid_ranker_metadata(Model,Diagnostics)
```

Mode and number of proofs:

```
valid_ranker_metadata(+atom,+list(compound)) - zero_or_one
```

---

valid_item_value_pairs/2

True when the second argument is an ordered list of unique `Item-Value` pairs aligned with the first argument item list.

Compilation flags:
`static`

Template:
`valid_item_value_pairs(Items,Pairs)`
Mode and number of proofs:
`valid_item_value_pairs(+list,+list(pair))` - `zero_or_one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.274.10 ranker_protocol

Protocol for machine learning rankers.

Public predicates

learn/3

Learns a ranker from the given dataset object using the specified options.

Compilation flags:
`static`

Template:
`learn(Dataset,Ranker,Options)`

Mode and number of proofs:
`learn(+object_identifier,-compound,+list(compound))` - `one`

---

learn/2

Learns a ranker from the given dataset object using default options.

Compilation flags:
`static`

Template:
`learn(Dataset,Ranker)`

Mode and number of proofs:
`learn(+object_identifier,-compound)` - `one`

---

rank/3

Ranks a list of candidate items using the learned ranker and returns the candidates ordered from most preferred to least preferred.

Compilation flags:

```
static
```

Template:

```
rank(Ranker,Candidates,Ranking)
```

Mode and number of proofs:

```
rank(+compound,+list,-list) - one
```

---

scores/2

Returns the learned item-score pairs on the ranker native numeric scale. Depending on the ranker, these values may also be interpreted more specifically as strengths or ratings.

Compilation flags:

```
static
```

Template:

```
scores(Ranker,Scores)
```

Mode and number of proofs:

```
scores(+compound,-list(pair)) - one
```

---

diagnostics/2

Returns diagnostics and metadata associated with a learned ranker in a representation-independent way.

Compilation flags:

```
static
```

Template:

```
diagnostics(Ranker,Diagnostics)
```

Mode and number of proofs:

```
diagnostics(+compound,-list(compound)) - one
```

---

diagnostic/2

Tests or enumerates individual diagnostics metadata terms for a learned ranker.

Compilation flags:
`static`

Template:
`diagnostic(Ranker,Diagnostic)`
Mode and number of proofs:
`diagnostic(+compound,?compound)` - `zero_or_more`

---

ranker_options/2

Returns the effective training options recorded in a learned ranker diagnostics list.

Compilation flags:
`static`

Template:
`ranker_options(Ranker,Options)`
Mode and number of proofs:
`ranker_options(+compound,-list(compound))` - `zero_or_one`

---

check_ranker/1

Checks that the argument is a structurally valid learned ranker term for the receiving ranker implementation, throwing an exception on invalid input when applicable.

Compilation flags:
`static`

Template:
`check_ranker(Ranker)`
Mode and number of proofs:
`check_ranker(@compound)` - `one_or_error`

Exceptions:
`Ranker` is a variable:
`instantiation_error`
`Ranker` is neither a variable nor a valid ranker:
`domain_error(ranker,Ranker)`

---

valid_ranker/1

True when *check_ranker/1* succeeds for the argument without throwing an exception.

Compilation flags:
`static`

Template:
`valid_ranker(Ranker)`
Mode and number of proofs:
`valid_ranker(@compound)` - `zero_or_one`

---

export_to_clauses/4

Converts a ranker into a list of predicate clauses. `Functor` is the functor for the generated predicate clauses. When exporting a serialized ranker term, a noun such as `ranker` or `model` is usually clearer than a verb or result label.

Compilation flags:
`static`

Template:
`export_to_clauses(Dataset,Ranker,Functor,Clauses)`
Mode and number of proofs:
`export_to_clauses(+object_identifier,+compound,+callable,-list(clause))` - `one`

---

export_to_file/4

Exports a ranker to a file. `Functor` is the functor for the generated predicate clauses. When exporting a serialized ranker term, a noun such as `ranker` or `model` is usually clearer than a verb or result label.

Compilation flags:
`static`

Template:
`export_to_file(Dataset,Ranker,Functor,File)`
Mode and number of proofs:
`export_to_file(+object_identifier,+compound,+callable,+atom)` - `one`

`print_ranker/1`

Prints a ranker to the current output stream in a human-readable format.

Compilation flags:
`static`

Template:
`print_ranker(Ranker)`
Mode and number of proofs:
`print_ranker(+compound)` - `one`

Public predicates

pairwise_dataset_declared_items/2

Collects the pairwise dataset declared items preserving declaration order.

Compilation flags:
`static`

Template:
`pairwise_dataset_declared_items(Dataset,Items)`
Mode and number of proofs:
`pairwise_dataset_declared_items(+object_identifier,-list)` - `one`

---

pairwise_dataset_items/2

Collects the unique pairwise dataset items preserving their first declaration order.

Compilation flags:
`static`

Template:
`pairwise_dataset_items(Dataset,Items)`
Mode and number of proofs:
`pairwise_dataset_items(+object_identifier,-list)` - `one`

---

pairwise_dataset_preferences/2

Collects the pairwise dataset preferences as `p(Winner,Loser,Weight)` terms.

Compilation flags:
`static`

Template:

```
pairwise_dataset_preferences(Dataset,Preferences)
```

Mode and number of proofs:

```
pairwise_dataset_preferences(+object_identifier,-list) - one
```

---

pairwise_dataset_connected_components/2

Returns the connected components induced by the pairwise preference graph.

Compilation flags:

```
static
```

Template:

```
pairwise_dataset_connected_components(Dataset,Components)
```

Mode and number of proofs:

```
pairwise_dataset_connected_components(+object_identifier,-list(list)) - one
```

---

pairwise_dataset_summary/2

Returns a summary of a pairwise dataset, including item, preference, component, and isolated-item counts.

Compilation flags:

```
static
```

Template:

```
pairwise_dataset_summary(Dataset,Summary)
```

Mode and number of proofs:

```
pairwise_dataset_summary(+object_identifier,-list(compound)) - one
```

---

pairwise_dataset_win_totals/2

Returns per-item total win weights for a pairwise dataset.

Compilation flags:

```
static
```

Template:

```
pairwise_dataset_win_totals(Dataset,Totals)
```

Mode and number of proofs:

```
pairwise_dataset_win_totals(+object_identifier,-list(pair)) - one
```

---

pairwise_dataset_matchups/2

Returns aggregated pairwise matchups as `matchup(Item1,Item2,Item1Wins,Item2Wins)` terms preserving item declaration order inside each pair.

Compilation flags:
`static`

Template:
`pairwise_dataset_matchups(Dataset,Matchups)`
Mode and number of proofs:
`pairwise_dataset_matchups(+object_identifier,-list(compound))` - `one`

---

pairwise_measurement_dataset_declared_items/2

Collects the pairwise measurement dataset declared items preserving declaration order.

Compilation flags:
`static`

Template:
`pairwise_measurement_dataset_declared_items(Dataset,Items)`
Mode and number of proofs:
`pairwise_measurement_dataset_declared_items(+object_identifier,-list)` - `one`

---

pairwise_measurement_dataset_items/2

Collects the unique pairwise measurement dataset items preserving their first declaration order.

Compilation flags:
`static`

Template:
`pairwise_measurement_dataset_items(Dataset,Items)`
Mode and number of proofs:
`pairwise_measurement_dataset_items(+object_identifier,-list)` - `one`

---

pairwise_measurement_dataset_measurements/2

Collects the pairwise measurement dataset observations as `m(Item1,Item2,Value,Weight)` terms preserving enumeration order.

Compilation flags:

```
static
```

Template:

```
pairwise_measurement_dataset_measurements(Dataset,Measurements)
```

Mode and number of proofs:

```
pairwise_measurement_dataset_measurements(+object_identifier,-list(compound)) -
one
```

---

pairwise_measurement_dataset_connected_components/2

Returns the connected components induced by the pairwise measurement support graph.

Compilation flags:

```
static
```

Template:

```
pairwise_measurement_dataset_connected_components(Dataset,Components)
```

Mode and number of proofs:

```
pairwise_measurement_dataset_connected_components(+object_identifier,-list(list))
- one
```

---

pairwise_measurement_dataset_summary/2

Returns a summary of a pairwise measurement dataset, including item, measurement, component, and isolated-item counts.

Compilation flags:

```
static
```

Template:

```
pairwise_measurement_dataset_summary(Dataset,Summary)
```

Mode and number of proofs:

```
pairwise_measurement_dataset_summary(+object_identifier,-list(compound)) - one
```

---

temporal_pairwise_dataset_declared_items/2

Collects the temporal pairwise dataset declared items preserving declaration order.

Compilation flags:
```
static
```

Template:
```
temporal_pairwise_dataset_declared_items(Dataset,Items)
```
Mode and number of proofs:
```
temporal_pairwise_dataset_declared_items(+object_identifier,-list) - one
```

---

temporal_pairwise_dataset_items/2

Collects the unique temporal pairwise dataset items preserving their first declaration order.

Compilation flags:
```
static
```

Template:
```
temporal_pairwise_dataset_items(Dataset,Items)
```
Mode and number of proofs:
```
temporal_pairwise_dataset_items(+object_identifier,-list) - one
```

---

temporal_pairwise_dataset_periods/2

Collects the unique temporal pairwise dataset periods preserving their first declaration order.

Compilation flags:
```
static
```

Template:
```
temporal_pairwise_dataset_periods(Dataset,Periods)
```
Mode and number of proofs:
```
temporal_pairwise_dataset_periods(+object_identifier,-list) - one
```

---

temporal_pairwise_dataset_games/2

Collects the temporal pairwise dataset games as `game(Period,Item1,Item2,Score)` terms preserving enumeration order.

Compilation flags:
`static`

Template:
`temporal_pairwise_dataset_games(Dataset,Games)`
Mode and number of proofs:
`temporal_pairwise_dataset_games(+object_identifier,-list(compound))` - `one`

---

temporal_pairwise_dataset_games/3

Collects the temporal pairwise dataset games for a single period as `game(Item1,Item2,Score)` terms preserving enumeration order.

Compilation flags:
`static`

Template:
`temporal_pairwise_dataset_games(Dataset,Period,Games)`
Mode and number of proofs:
`temporal_pairwise_dataset_games(+object_identifier,+term,-list(compound))` - `one`

---

temporal_pairwise_dataset_connected_components/2

Returns the connected components induced by the temporal pairwise game graph.

Compilation flags:
`static`

Template:
`temporal_pairwise_dataset_connected_components(Dataset,Components)`
Mode and number of proofs:
`temporal_pairwise_dataset_connected_components(+object_identifier,-list(list))` - `one`

---

temporal_pairwise_dataset_summary/2

Returns a summary of a temporal pairwise dataset, including item, period, game, component, and isolated-item counts.

Compilation flags:

```
static
```

Template:

```
temporal_pairwise_dataset_summary(Dataset,Summary)
```

Mode and number of proofs:

```
temporal_pairwise_dataset_summary(+object_identifier,-list(compound)) - one
```

---

multiplayer_dataset_declared_items/2

Collects the multiplayer dataset declared items preserving declaration order.

Compilation flags:

```
static
```

Template:

```
multiplayer_dataset_declared_items(Dataset,Items)
```

Mode and number of proofs:

```
multiplayer_dataset_declared_items(+object_identifier,-list) - one
```

---

multiplayer_dataset_items/2

Collects the unique multiplayer dataset items preserving their first declaration order.

Compilation flags:

```
static
```

Template:

```
multiplayer_dataset_items(Dataset,Items)
```

Mode and number of proofs:

```
multiplayer_dataset_items(+object_identifier,-list) - one
```

---

multiplayer_dataset_declared_matches/2

Collects the multiplayer dataset declared matches preserving chronological declaration order.

Compilation flags:
`static`

Template:
`multiplayer_dataset_declared_matches(Dataset,Matches)`
Mode and number of proofs:
`multiplayer_dataset_declared_matches(+object_identifier,-list)` - `one`

---

multiplayer_dataset_matches/2

Collects the unique multiplayer dataset matches preserving their first declaration order.

Compilation flags:
`static`

Template:
`multiplayer_dataset_matches(Dataset,Matches)`
Mode and number of proofs:
`multiplayer_dataset_matches(+object_identifier,-list)` - `one`

---

multiplayer_dataset_match_teams/3

Materializes one match as ordered `team(Team,Rank,Members)` terms, where members are `Item-Weight` pairs.

Compilation flags:
`static`

Template:
`multiplayer_dataset_match_teams(Dataset,Match,Teams)`
Mode and number of proofs:
`multiplayer_dataset_match_teams(+object_identifier,+term,-list(compound))` - `one`

---

multiplayer_dataset_events/2

Materializes matches in chronological order as `match(Match,Teams)` terms.

Compilation flags:
`static`

Template:
`multiplayer_dataset_events(Dataset,Events)`
Mode and number of proofs:
`multiplayer_dataset_events(+object_identifier,-list(compound))` - `one`

---

multiplayer_dataset_connected_components/2

Returns the connected components induced by players participating in the same match.

Compilation flags:
`static`

Template:
`multiplayer_dataset_connected_components(Dataset,Components)`
Mode and number of proofs:
`multiplayer_dataset_connected_components(+object_identifier,-list(list))` - `one`

---

multiplayer_dataset_summary/2

Returns a summary of a multiplayer dataset, including item, match, team, participation, component, and isolated-item counts.

Compilation flags:
`static`

Template:
`multiplayer_dataset_summary(Dataset,Summary)`
Mode and number of proofs:
`multiplayer_dataset_summary(+object_identifier,-list(compound))` - `one`

---

grouped_dataset_groups/2

Collects the unique grouped-dataset groups preserving their first declaration order.

Compilation flags:
```
static
```

Template:
```
grouped_dataset_groups(Dataset,Groups)
```
Mode and number of proofs:
```
grouped_dataset_groups(+object_identifier,-list) - one
```

---

grouped_dataset_items/2

Collects the unique items declared across all groups in a grouped dataset preserving their first declaration order.

Compilation flags:
```
static
```

Template:
```
grouped_dataset_items(Dataset,Items)
```
Mode and number of proofs:
```
grouped_dataset_items(+object_identifier,-list) - one
```

---

grouped_dataset_items/3

Collects the unique items declared for a grouped-dataset group.

Compilation flags:
```
static
```

Template:
```
grouped_dataset_items(Dataset,Group,Items)
```
Mode and number of proofs:
```
grouped_dataset_items(+object_identifier,+term,-list) - one
```

---

grouped_dataset_summary/2

Returns a summary of a grouped dataset, including group, item, and relevance-judgment counts.

Compilation flags:

```
static
```

Template:

```
grouped_dataset_summary(Dataset,Summary)
```

Mode and number of proofs:

```
grouped_dataset_summary(+object_identifier,-list(compound)) - one
```

---

validate_pairwise_dataset/1

Validates a pairwise ranking dataset and throws an error if the dataset is malformed or disconnected.

Compilation flags:

```
static
```

Template:

```
validate_pairwise_dataset(Dataset)
```

Mode and number of proofs:

```
validate_pairwise_dataset(+object_identifier) - one
```

---

validate_pairwise_dataset/2

Validates a pairwise ranking dataset and returns its dataset summary when validation succeeds.

Compilation flags:

```
static
```

Template:

```
validate_pairwise_dataset(Dataset,Summary)
```

Mode and number of proofs:

```
validate_pairwise_dataset(+object_identifier,-list(compound)) - one
```

---

validate_pairwise_measurement_dataset/1

Validates a pairwise measurement dataset and throws an error if the dataset is malformed or disconnected.

Compilation flags:

```
static
```

Template:

```
validate_pairwise_measurement_dataset(Dataset)
```

Mode and number of proofs:

```
validate_pairwise_measurement_dataset(+object_identifier) - one
```

---

validate_pairwise_measurement_dataset/2

Validates a pairwise measurement dataset and returns its dataset summary when validation succeeds.

Compilation flags:

```
static
```

Template:

```
validate_pairwise_measurement_dataset(Dataset,Summary)
```

Mode and number of proofs:

```
validate_pairwise_measurement_dataset(+object_identifier,-list(compound)) - one
```

---

validate_grouped_dataset/1

Validates a grouped ranking dataset and throws an error if the dataset is malformed.

Compilation flags:

```
static
```

Template:

```
validate_grouped_dataset(Dataset)
```

Mode and number of proofs:

```
validate_grouped_dataset(+object_identifier) - one
```

---

validate_temporal_pairwise_dataset/1

Validates a temporal pairwise ranking dataset and throws an error if the dataset is malformed or disconnected.

Compilation flags:
```
static
```

Template:
```
validate_temporal_pairwise_dataset(Dataset)
```
Mode and number of proofs:
```
validate_temporal_pairwise_dataset(+object_identifier) - one
```

---

validate_temporal_pairwise_dataset/2

Validates a temporal pairwise ranking dataset and returns its dataset summary when validation succeeds.

Compilation flags:
```
static
```

Template:
```
validate_temporal_pairwise_dataset(Dataset,Summary)
```
Mode and number of proofs:
```
validate_temporal_pairwise_dataset(+object_identifier,-list(compound)) - one
```

---

validate_multiplayer_dataset/1

Validates a multiplayer ranking dataset and throws an error if the dataset is malformed.

Compilation flags:
```
static
```

Template:
```
validate_multiplayer_dataset(Dataset)
```
Mode and number of proofs:
```
validate_multiplayer_dataset(+object_identifier) - one
```

---

validate_multiplayer_dataset/2

Validates a multiplayer ranking dataset and returns its dataset summary when validation succeeds.

Compilation flags:

```
static
```

Template:

```
validate_multiplayer_dataset(Dataset,Summary)
```

Mode and number of proofs:

```
validate_multiplayer_dataset(+object_identifier,-list(compound)) - one
```

---

validate_grouped_dataset/2

Validates a grouped ranking dataset and returns its dataset summary when validation succeeds.

Compilation flags:

```
static
```

Template:

```
validate_grouped_dataset(Dataset,Summary)
```

Mode and number of proofs:

```
validate_grouped_dataset(+object_identifier,-list(compound)) - one
```

Protected predicates

grouped_dataset_item_relevances/4

Collects the declared items for a grouped-dataset group paired with their relevance values under the given missing-relevance policy.

Compilation flags:

```
static
```

Template:

```
grouped_dataset_item_relevances(Dataset,Group,MissingRelevance,ItemRelevances)
```

Mode and number of proofs:

```
grouped_dataset_item_relevances(+object_identifier,+term,+atom,-list(pair)) - one
```

---

grouped_dataset_relevance_frequencies/2

Aggregates grouped item relevances into a relevance-frequency dictionary.

Compilation flags:
`static`

Template:
`grouped_dataset_relevance_frequencies(ItemRelevances,FrequencyDictionary)`
Mode and number of proofs:
`grouped_dataset_relevance_frequencies(+list(pair),-compound)` - `one`

---

grouped_dataset_item_relevance_scores/3

Maps grouped item relevances to per-item score deltas using a relevance-points dictionary.

Compilation flags:
`static`

Template:
`grouped_dataset_item_relevance_scores(ItemRelevances,PointsDictionary,ItemScores)`
Mode and number of proofs:
`grouped_dataset_item_relevance_scores(+list(pair),+compound,-list(pair))` - `one`

---

grouped_dataset_tie_blocks/4

Collects grouped-dataset item relevances into descending relevance tie blocks represented as `tie_block(Relevance,Items)` terms, preserving the declaration order of items inside each block.

Compilation flags:
`static`

Template:
`grouped_dataset_tie_blocks(Dataset,Group,MissingRelevance,TieBlocks)`
Mode and number of proofs:
`grouped_dataset_tie_blocks(+object_identifier,+term,+atom,-list(compound))` - `one`

Private predicates

- *Operators*

Public predicates

group/1

Enumerates by backtracking the ranking groups or contexts in the dataset.

Compilation flags:
```
static
```

Template:
```
group(Group)
```
Mode and number of proofs:
```
group(-atom) - zero_or_more
```

---

item/2

Enumerates by backtracking the items available inside each ranking group or context.

Compilation flags:
```
static
```

Template:
```
item(Group,Item)
```
Mode and number of proofs:
```
item(+atom,-atom) - zero_or_more
item(-atom,-atom) - zero_or_more
```

---

relevance/3

Enumerates by backtracking the non-negative integer relevance judgments associated with each group and item.

Compilation flags:
```
static
```

Template:
```
relevance(Group,Item,Relevance)
```
Mode and number of proofs:
```
relevance(+atom,+atom,-integer) - zero_or_more
relevance(-atom,-atom,-integer) - zero_or_more
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

score_ranker_model/1

Hook predicate that importing rankers must define to identify the learned score-ranker model.

Compilation flags:

```
static
```

Template:

```
score_ranker_model(Model)
```

Mode and number of proofs:

```
score_ranker_model(-atom) - one
```

score_ranker_label/1

Hook predicate that importing rankers must define to provide a human-readable label used by pretty-printing helpers.

Compilation flags:
`static`

Template:
`score_ranker_label(Label)`
Mode and number of proofs:
`score_ranker_label(-atom)` - `one`

---

score_ranker_term/4

Hook predicate that importing rankers must define to map between the ranker term representation and its items, scores, and diagnostics payloads.

Compilation flags:
`static`

Template:
`score_ranker_term(Items,Scores,Diagnostics,Ranker)`
Mode and number of proofs:
`score_ranker_term(?list,?list,?list(compound),?compound)` - `zero_or_one`

---

valid_score/1

Hook predicate that importing rankers must define to validate individual learned score values.

Compilation flags:
`static`

Template:
`valid_score(Score)`
Mode and number of proofs:
`valid_score(+number)` - `zero_or_one`

---

build_score_ranker/5

Builds a self-describing score-ranker term from ordered items, score pairs, effective options, and dataset summary metadata.

Compilation flags:
```
static
```

Template:
```
build_score_ranker(Items,Scores,Options,DatasetSummary,Ranker)
```
Mode and number of proofs:
```
build_score_ranker(+list,+list(pair),+list(compound),+list(compound),-compound) -
one
```

---

score_ranker_data/4

Validates and destructures a score-ranker term into its items, score pairs, and diagnostics payloads.

Compilation flags:
```
static
```

Template:
```
score_ranker_data(Ranker,Items,Scores,Diagnostics)
```
Mode and number of proofs:
```
score_ranker_data(+compound,-list,-list(pair),-list(compound)) - one
```

---

valid_score_ranker_diagnostics/3

Hook predicate that importing rankers can define to validate diagnostics beyond the common model, options, and dataset summary metadata.

Compilation flags:
```
static
```

Template:
```
valid_score_ranker_diagnostics(Items,Scores,Diagnostics)
```
Mode and number of proofs:
```
valid_score_ranker_diagnostics(+list,+list(pair),+list(compound)) - zero_or_one
```

---

initialize_scores/2

Initializes a score dictionary with zero scores for the given ordered items.

Compilation flags:
```
static
```

Template:
```
initialize_scores(Items,Scores)
```
Mode and number of proofs:
```
initialize_scores(+list,-compound) - one
```

---

accumulate_item_scores/3

Accumulates item score deltas into a score dictionary.

Compilation flags:
```
static
```

Template:
```
accumulate_item_scores(ItemDeltas,Scores,UpdatedScores)
```
Mode and number of proofs:
```
accumulate_item_scores(+list(pair),+compound,-compound) - one
```

---

update_score/4

Updates the score of a single item in a score dictionary by adding the given delta.

Compilation flags:
```
static
```

Template:
```
update_score(Scores,Item,Delta,UpdatedScores)
```
Mode and number of proofs:
```
update_score(+compound,+term,+number,-compound) - one
```

---

ordered_scores/3

Materializes ordered `Item-Score` pairs from a score dictionary using the given item order.

Compilation flags:
`static`

Template:
`ordered_scores(Items,ScoresDictionary,Scores)`
Mode and number of proofs:
`ordered_scores(+list,+compound,-list(pair))` - `one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.274.15 temporal_pairwise_ranking_dataset_protocol

Protocol for temporal pairwise ranking datasets with explicit rating periods and per-game outcomes.

Availability:

Public predicates

item/1

Enumerates by backtracking the items that can be ranked.

Compilation flags:
`static`

Template:
`item(Item)`
Mode and number of proofs:
`item(-atom)` - `zero_or_more`

---

period/1

Enumerates by backtracking the rating periods in declaration order.

Compilation flags:
`static`

Template:
`period(Period)`
Mode and number of proofs:
`period(-atom)` - `zero_or_more`

---

game/4

Enumerates by backtracking observed games where `Score` is the result for `Item1` against `Item2` in the given `Period`.

Compilation flags:
`static`

Template:
`game(Period,Item1,Item2,Score)`
Mode and number of proofs:
`game(-atom,-atom,-atom,-number)` - `zero_or_more`

Public predicates

file_to_codes/2

Reads a text file into a list of character codes.

Compilation flags:
`static`

Template:
`file_to_codes(File,Codes)`
Mode and number of proofs:
`file_to_codes(+atom,-list(character_code))` - `one`

---

file_to_codes/3

Reads a text file into a list of character codes. The list is terminated by the given tail.

Compilation flags:
`static`

Template:
`file_to_codes(File,Codes,Tail)`
Mode and number of proofs:
`file_to_codes(+atom,-list(character_code),@term)` - `one`

---

file_to_chars/2

Reads a text file into a list of characters.

Compilation flags:
```
static
```

Template:
```
file_to_chars(File,Chars)
```
Mode and number of proofs:
```
file_to_chars(+atom,-list(character)) - one
```

---

file_to_chars/3

Reads a text file into a list of characters. The list is terminated by the given tail.

Compilation flags:
```
static
```

Template:
```
file_to_chars(File,Chars,Tail)
```
Mode and number of proofs:
```
file_to_chars(+atom,-list(character),@term) - one
```

---

file_to_terms/2

Reads a text file into a list of terms.

Compilation flags:
```
static
```

Template:
```
file_to_terms(File,Terms)
```
Mode and number of proofs:
```
file_to_terms(+atom,-list(term)) - one
```

---

file_to_terms/3

Reads a text file into a list of terms. The list is terminated by the given tail.

Compilation flags:
```
static
```

Template:
```
file_to_terms(File,Terms,Tail)
```
Mode and number of proofs:
```
file_to_terms(+atom,-list(term),@term) - one
```

---

file_to_bytes/2

Reads a binary file into a list of bytes.

Compilation flags:
```
static
```

Template:
```
file_to_bytes(File,Bytes)
```
Mode and number of proofs:
```
file_to_bytes(+atom,-list(byte)) - one
```

---

file_to_bytes/3

Reads a binary file into a list of bytes. The list is terminated by the given tail.

Compilation flags:
```
static
```

Template:
```
file_to_bytes(File,Bytes,Tail)
```
Mode and number of proofs:
```
file_to_bytes(+atom,-list(byte),@term) - one
```

---

stream_to_codes/2

Reads a text stream into a list of character codes. Does not close the stream.

Compilation flags:
```
static
```

Template:
```
stream_to_codes(Stream,Codes)
```
Mode and number of proofs:
```
stream_to_codes(+stream_or_alias,-list(character_code)) - one
```

---

stream_to_codes/3

Reads a text stream into a list of character codes. Does not close the stream. The list is terminated by the given tail.

Compilation flags:
```
static
```

Template:
```
stream_to_codes(Stream,Codes,Tail)
```
Mode and number of proofs:
```
stream_to_codes(+stream_or_alias,-list(character_code),@term) - one
```

---

stream_to_chars/2

Reads a text stream into a list of characters. Does not close the stream.

Compilation flags:
```
static
```

Template:
```
stream_to_chars(Stream,Chars)
```
Mode and number of proofs:
```
stream_to_chars(+stream_or_alias,-list(char)) - one
```

---

stream_to_chars/3

Reads a text stream into a list of characters. Does not close the stream. The list is terminated by the given tail.

Compilation flags:
```
static
```

Template:
```
stream_to_chars(Stream,Chars,Tail)
```
Mode and number of proofs:
```
stream_to_chars(+stream_or_alias,-list(char),@term) - one
```

---

stream_to_terms/2

Reads a text stream into a list of terms. Does not close the stream.

Compilation flags:
```
static
```

Template:
```
stream_to_terms(Stream,Terms)
```
Mode and number of proofs:
```
stream_to_terms(+stream_or_alias,-list(term)) - one
```

---

stream_to_terms/3

Reads a text stream into a list of terms. Does not close the stream. The list is terminated by the given tail.

Compilation flags:
```
static
```

Template:
```
stream_to_terms(Stream,Terms,Tail)
```
Mode and number of proofs:
```
stream_to_terms(+stream_or_alias,-list(term),@term) - one
```

---

stream_to_bytes/2

Reads a binary stream into a list of bytes. Does not close the stream.

Compilation flags:
```
static
```

Template:
```
stream_to_bytes(Stream,Bytes)
```
Mode and number of proofs:
```
stream_to_bytes(+stream_or_alias,-list(byte)) - one
```

---

stream_to_bytes/3

Reads a binary stream into a list of bytes. Does not close the stream. The list is terminated by the given tail.

Compilation flags:
```
static
```

Template:
```
stream_to_bytes(Stream,Bytes,Tail)
```
Mode and number of proofs:
```
stream_to_bytes(+stream_or_alias,-list(byte),@term) - one
```

---

line_to_chars/2

Reads a line from a text stream into a list of characters. Discards the end-of-line characters. Unifies `Chars` with `end_of_file` at the end of the file.

Compilation flags:
```
static
```

Template:
```
line_to_chars(Stream,Chars)
```
Mode and number of proofs:
```
line_to_chars(+stream_or_alias,-types([atom,list(character)])) - one
```

---

line_to_chars/3

Reads a line from a text stream into a list of characters. Keeps the end-of-line marker normalized to the line feed control character. The list is terminated by the given tail, which is unified with the empty list at the end of the file.

Compilation flags:

```
static
```

Template:

```
line_to_chars(Stream,Chars,Tail)
```

Mode and number of proofs:

```
line_to_chars(+stream_or_alias,-list(character),?term) - one
```

---

line_to_codes/2

Reads a line from a text stream into a list of character codes. Discards the end-of-line character codes. Unifies `Codes` with `end_of_file` at the end of the file.

Compilation flags:

```
static
```

Template:

```
line_to_codes(Stream,Codes)
```

Mode and number of proofs:

```
line_to_codes(+stream_or_alias,-types([atom,list(character_code)])) - one
```

---

line_to_codes/3

Reads a line from a text stream into a list of character codes. Keeps the end-of-line marker normalized to the line feed control character code. The list is terminated by the given tail, which is unified with the empty list at the end of the file.

Compilation flags:

```
static
```

Template:

```
line_to_codes(Stream,Codes,Tail)
```

Mode and number of proofs:

```
line_to_codes(+stream_or_alias,-list(character_code),?term) - one
```

---

line_to_bytes/2

Reads a line from a binary stream into a list of bytes. Discards the end-of-line bytes. Unifies `Bytes` with `end_of_file` at the end of the file.

Compilation flags:

```
static
```

Template:

```
line_to_bytes(Stream,Bytes)
```

Mode and number of proofs:

```
line_to_bytes(+stream_or_alias,-types([atom,list(byte)])) - one
```

---

line_to_bytes/3

Reads a line from a binary stream into a list of bytes. Keeps the end-of-line marker normalized to the line feed control byte. The list is terminated by the given tail, which is unified with the empty list at the end of the file.

Compilation flags:

```
static
```

Template:

```
line_to_bytes(Stream,Bytes,Tail)
```

Mode and number of proofs:

```
line_to_bytes(+stream_or_alias,-list(byte),?term) - one
```

Operators

(none)

1.276 recommender_protocols

object

1.276.1 cosine_similarity

Cosine similarity between two sparse Key-Value vectors, using scaled unit normalization to avoid squaring original magnitudes. Norms use each whole vector and the dot product uses common keys, treating missing entries as zeros. Results range from -1.0 to 1.0, or 0.0 to 1.0 for non-negative values. No common key or an all-zero vector gives 0.0.

Public predicates

item/1

Enumerates distinct instantiated atomic catalog identifiers, including items with no ratings.

Compilation flags:
`static`

Template:
`item(Item)`
Mode and number of proofs:
`item(-atomic)` - `zero_or_more`

---

item_content/2

Enumerates exactly one content descriptor for each catalog item. Descriptors are `features(Occurrences)` with ground feature occurrences or `vector(Pairs)` with unique ground feature keys and finite nonnegative weights. Empty lists are allowed. All items use the same descriptor kind.

Compilation flags:
`static`

Template:
`item_content(Item,Content)`
Mode and number of proofs:
`item_content(-atomic,-compound)` - `zero_or_more`
`item_content(+atomic,-compound)` - `one`

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

collect_contents/3

Collects and validates a nonempty catalog and its content declarations.

Compilation flags:
`static`

Template:
`collect_contents(Dataset,Contents,Kind)`

Mode and number of proofs:

`collect_contents(+object_identifier,-list(pair),-atom)` - `one_or_error`

Exceptions:

The catalog is empty:

`domain_error(non_empty_catalog,Dataset)`

An item identifier is a variable:

`instantiation_error`

An item identifier is not atomic:

`type_error(atomic,Item)`

A catalog item is declared more than once:

`domain_error(duplicate_item,Item)`

Content declarations do not cover the catalog exactly once:

`domain_error(item_content_coverage,Dataset)`

A content descriptor is invalid:

`domain_error(item_content,Content)`

Content representations are mixed:

`domain_error(content_representation,Content)`

A content list is not a proper list:

`type_error(list,List)`

A feature or content list is not a ground term:

`instantiation_error`

A sparse vector repeats a feature key:

`domain_error(duplicate_feature,Feature)`

A sparse vector entry is not a pair:

`type_error(pair,Entry)`

A sparse weight is not numeric:

`type_error(number,Weight)`

A sparse weight is negative or nonfinite:

`domain_error(non_negative_finite_weight,Weight)`

`canonical_contents/3`

Canonicalizes content declarations, preserving feature occurrences and removing zero vector weights. Fails for an empty list.

Compilation flags:

`static`

Template:

`canonical_contents(Contents,Canonical,Kind)`

Mode and number of proofs:

`canonical_contents(+list(pair),-list(pair),-atom)` - `zero_or_one_or_error`

Exceptions:

An item identifier or feature is a variable:

`instantiation_error`

An item identifier is not atomic:

```
type_error(atomic,Item)
```

An item is declared more than once:

```
domain_error(duplicate_item,Item)
```

A content descriptor is invalid:

```
domain_error(item_content,Content)
```

Content representations are mixed:

```
domain_error(content_representation,Content)
```

A content list is not a proper list:

```
type_error(list,List)
```

A sparse vector repeats a feature key:

```
domain_error(duplicate_feature,Feature)
```

A sparse vector entry is not a pair:

```
type_error(pair,Entry)
```

A sparse weight is not numeric:

```
type_error(number,Weight)
```

A sparse weight is negative or nonfinite:

```
domain_error(non_negative_finite_weight,Weight)
```

---

check_rated_catalog/2

Checks that every rated item belongs to the content catalog.

Compilation flags:

```
static
```

Template:

```
check_rated_catalog(Ratings,Contents)
```

Mode and number of proofs:

```
check_rated_catalog(+list(compound),+list(pair)) - one_or_error
```

Exceptions:

A rated item is absent from the catalog:

```
domain_error(catalog_item,Item)
```

Private predicates

object

1.276.6 `pearson_similarity`

Pearson correlation between two sparse Key-Value vectors, computed only over common keys using shifted, scaled centering and unit normalization. Results range from -1.0 to 1.0. Fewer than two common keys, or exactly constant values in either common-key subset, gives 0.0.

- *Private predicates*
- *Operators*

Public predicates

rating/3

Enumerates by backtracking the known ratings. User and Item must be instantiated atomic identifiers and Rating is the numeric rating given by User to Item. At most one rating is declared per User-Item pair.

Compilation flags:

```
static
```

Template:

```
rating(User,Item,Rating)
```

Mode and number of proofs:

```
rating(-atomic,-atomic,-number) - zero_or_more
```

---

rating_count/1

Returns the number of known ratings. The declared count must match the number of ratings enumerated by rating/3.

Compilation flags:

```
static
```

Template:

```
rating_count(Count)
```

Mode and number of proofs:

```
rating_count(-positive_integer) - one
```

---

rating_scale/2

Returns the inclusive lower and upper bounds of the rating scale (e.g. 1 and 5). Fails when the dataset declares no fixed scale.

Compilation flags:

```
static
```

Template:

```
rating_scale(Min,Max)
```

Mode and number of proofs:

```
rating_scale(-number,-number) - zero_or_one
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

recommender_valid_data/1

Required hook that validates implementation-specific model data and its consistency with diagnostics without instantiating the recommender.

Compilation flags:

```
static
```

Template:

```
recommender_valid_data(Recommender)
```

Mode and number of proofs:

```
recommender_valid_data(@compound) - zero_or_one
```

---

recommender_diagnostics_data/2

Hook predicate that importing recommender implementations must define in order to expose diagnostics metadata. A default implementation is provided that assumes the diagnostics list is the last argument of the recommender term; concrete implementations following that convention do not need to override it.

Compilation flags:

```
static
```

Template:

```
recommender_diagnostics_data(Recommender,Diagnostics)
```

Mode and number of proofs:

```
recommender_diagnostics_data(+compound,-list(compound)) - one
```

---

recommender_export_template/4

Hook predicate that importing recommender implementations must define in order to expose the exported recommender template for a given functor.

Compilation flags:

```
static
```

Template:

```
recommender_export_template(Dataset,Recommender,Functor,Template)
```

Mode and number of proofs:

```
recommender_export_template(+object_identifier,+compound,+atom,-callable) - one
```

---

recommender_term_template/2

Hook predicate that importing recommender implementations must define in order to expose the learned recommender term template used by pretty-printing helpers.

Compilation flags:

```
static
```

Template:

```
recommender_term_template(Recommender,Template)
```

Mode and number of proofs:

```
recommender_term_template(+compound,-callable) - one
```

---

print_recommender_template/1

Pretty-printing helper predicate used by importing recommender implementations to show the learned recommender term template.

Compilation flags:

```
static
```

Template:

```
print_recommender_template(Recommender)
```

Mode and number of proofs:

```
print_recommender_template(+compound) - one
```

---

dataset_ratings/2

Collects ratings with atomic user and item identifiers as `rating(User, Item, Rating)` terms. Checks for duplicate user-item pairs and a declared rating count matching the observed count.

Compilation flags:

```
static
```

Template:

```
dataset_ratings(Dataset,Ratings)
```

Mode and number of proofs:

```
dataset_ratings(+object_identifier,-list(compound)) - one_or_error
```

Exceptions:

The dataset contains no ratings:

```
domain_error(non_empty_ratings,Dataset)
```

A user or item identifier is a variable:

```
instantiation_error
```

A user or item identifier is not atomic:

```
type_error(atomic,Identifier)
```

The same `User-Item` pair is rated more than once:
`domain_error(duplicate_rating,User-Item)`
The declared rating count is a variable:
`instantiation_error`
The declared rating count is neither a variable nor an integer:
`type_error(integer,DeclaredCount)`
The declared rating count is an integer but is not positive:
`domain_error(positive_integer,DeclaredCount)`
The declared and observed rating counts differ:
`consistency_error(rating_count,DeclaredCount,ObservedCount)`

---

check_no_duplicate_ratings/1

Checks that ratings with atomic user and item identifiers contain no duplicate user-item pair.

Compilation flags:
`static`

Template:
`check_no_duplicate_ratings(Ratings)`
Mode and number of proofs:
`check_no_duplicate_ratings(+list(compound))` - `one_or_error`

Exceptions:
The same user-item pair is rated more than once:
`domain_error(duplicate_rating,User-Item)`

---

check_ratings/2

Checks that ratings are non-empty, have atomic user and item identifiers and numeric values, and fall within any declared `rating_scale/2`.

Compilation flags:
`static`

Template:
`check_ratings(Dataset,Ratings)`
Mode and number of proofs:
`check_ratings(+object_identifier,+list(compound))` - `one_or_error`

Exceptions:
`Ratings` is empty:
`domain_error(non_empty_ratings,Dataset)`
A user or item identifier is a variable:
`instantiation_error`

A user or item identifier is not atomic:
`type_error(atomic,Identifier)`
A rating value is not a number:
`type_error(number,Rating)`
A scale bound is not numeric:
`type_error(number,Bound)`
Scale bounds are reversed:
`domain_error(rating_scale,Min-Max)`
A rating value is a number but falls outside the declared rating scale:
`domain_error(rating_scale(Min,Max),Rating)`

---

check_query_identifiers/2

Checks that prediction identifiers are instantiated atomic terms.

Compilation flags:
`static`

Template:
`check_query_identifiers(User,Item)`
Mode and number of proofs:
`check_query_identifiers(@term,@term)` - `one_or_error`

Exceptions:
An identifier is a variable:
`instantiation_error`
An identifier is not atomic:
`type_error(atomic,Identifier)`

---

dataset_rating_scale/2

Returns `none` or a validated inclusive `scale(Min, Max)`.

Compilation flags:
`static`

Template:
`dataset_rating_scale(Dataset,Scale)`
Mode and number of proofs:
`dataset_rating_scale(+object_identifier,-term)` - `one_or_error`

Exceptions:
A scale bound is a variable:
`instantiation_error`

A scale bound is not numeric:

```
type_error(number,Bound)
```

Scale bounds are reversed:

```
domain_error(rating_scale,Min-Max)
```

---

fallback_rating/5

Returns the user mean, otherwise the item mean, otherwise the supplied global mean.

Compilation flags:

```
static
```

Template:

```
fallback_rating(Ratings,GlobalMean,User,Item,Rating)
```

Mode and number of proofs:

```
fallback_rating(+list(compound),+number,+atomic,+atomic,-number) - one
```

---

clip_rating/3

Clips a rating to a validated `scale(Min, Max)`; `none` leaves it unchanged.

Compilation flags:

```
static
```

Template:

```
clip_rating(Scale,Rating,Clipped)
```

Mode and number of proofs:

```
clip_rating(+term,+number,-number) - one
```

---

recommend_from_ratings/5

Scores unrated catalog items using self `score/4` and returns up to `N` descending-score pairs; ties use descending standard item order.

Compilation flags:

```
static
```

Template:

```
recommend_from_ratings(Recommender,Ratings,User,N,Recommendations)
```

Mode and number of proofs:

```
recommend_from_ratings(+compound,+list(compound),+atomic,+positive_integer,
-list(pair)) - one_or_error
```

Exceptions:

A required argument is a variable:

```
instantiation_error
```

The model is invalid:

```
domain_error(recommender,Recommender)
```

User is not atomic:

```
type_error(atomic,User)
```

N is not an integer:

```
type_error(integer,N)
```

N is not positive:

```
domain_error(positive_integer,N)
```

---

users/2

Returns the sorted list of distinct users appearing in a list of `rating/3` terms.

Compilation flags:

```
static
```

Template:

```
users(Ratings,Users)
```

Mode and number of proofs:

```
users(+list(compound),-list(atomic)) - one
```

---

items/2

Returns the sorted list of distinct items appearing in a list of `rating/3` terms.

Compilation flags:

```
static
```

Template:

```
items(Ratings,Items)
```

Mode and number of proofs:

```
items(+list(compound),-list(atomic)) - one
```

---

user_vector/3

Returns the sparse rating vector of a user, as a list of `Item-Rating` pairs, from a list of `rating/3` terms. The vector is empty when the user has no ratings.

Compilation flags:

`static`

Template:

```
user_vector(Ratings,User,Vector)
```

Mode and number of proofs:

```
user_vector(+list(compound),+atomic,-list(pair)) - one
```

---

item_vector/3

Returns the sparse rating vector of an item, as a list of `User-Rating` pairs, from a list of `rating/3` terms. The vector is empty when the item has no ratings.

Compilation flags:

`static`

Template:

```
item_vector(Ratings,Item,Vector)
```

Mode and number of proofs:

```
item_vector(+list(compound),+atomic,-list(pair)) - one
```

---

global_mean_rating/2

Computes the mean of every rating in a list of `rating/3` terms (the global mean baseline).

Compilation flags:

`static`

Template:

```
global_mean_rating(Ratings,Mean)
```

Mode and number of proofs:

```
global_mean_rating(+list(compound),-float) - one_or_error
```

Exceptions:

`Ratings` is empty:

```
evaluation_error(zero_divisor)
```

---

user_mean_rating/3

Computes the mean of the ratings given by a user (the user mean baseline).

Compilation flags:
`static`

Template:
`user_mean_rating(Ratings,User,Mean)`
Mode and number of proofs:
`user_mean_rating(+list(compound),+atomic,-float)` - `one_or_error`

Exceptions:
`User` has no ratings:
`evaluation_error(zero_divisor)`

---

item_mean_rating/3

Computes the mean of the ratings received by an item (the item mean baseline).

Compilation flags:
`static`

Template:
`item_mean_rating(Ratings,Item,Mean)`
Mode and number of proofs:
`item_mean_rating(+list(compound),+atomic,-float)` - `one_or_error`

Exceptions:
`Item` has no ratings:
`evaluation_error(zero_divisor)`

---

cosine_similarity/3

Convenience predicate equivalent to `cosine_similarity::similarity/3`.

Compilation flags:
`static`

Template:
`cosine_similarity(Vector1,Vector2,Similarity)`
Mode and number of proofs:
`cosine_similarity(+list(pair),+list(pair),-number)` - `one`

---

pearson_similarity/3

Convenience predicate equivalent to `pearson_similarity::similarity/3`.

Compilation flags:
`static`

Template:
`pearson_similarity(Vector1,Vector2,Similarity)`
Mode and number of proofs:
`pearson_similarity(+list(pair),+list(pair),-number)` - `one`

---

jaccard_similarity/3

Convenience predicate equivalent to `jaccard_similarity::similarity/3`.

Compilation flags:
`static`

Template:
`jaccard_similarity(Vector1,Vector2,Similarity)`
Mode and number of proofs:
`jaccard_similarity(+list(pair),+list(pair),-number)` - `one`

---

msd_similarity/3

Convenience predicate equivalent to `msd_similarity::similarity/3`.

Compilation flags:
`static`

Template:
`msd_similarity(Vector1,Vector2,Similarity)`
Mode and number of proofs:
`msd_similarity(+list(pair),+list(pair),-number)` - `one`

---

spearman_similarity/3

Convenience predicate equivalent to `spearman_similarity::similarity/3`.

Compilation flags:
`static`

Template:
`spearman_similarity(Vector1,Vector2,Similarity)`
Mode and number of proofs:
`spearman_similarity(+list(pair),+list(pair),-number)` - `one`

---

top_k/3

Returns the `K` highest-scoring `Key-Score` pairs, sorted by decreasing score. Returns every pair, still sorted, when fewer than `K` are given; does not fail or throw an exception in that case.

Compilation flags:
`static`

Template:
`top_k(Pairs,K,TopK)`
Mode and number of proofs:
`top_k(+list(pair),+positive_integer,-list(pair))` - `one`

---

base_recommender_diagnostics/5

Builds the common part of a recommender diagnostics metadata list, combined with implementation-specific extra diagnostics terms.

Compilation flags:
`static`

Template:
`base_recommender_diagnostics(Model,RatingCount,Options,ExtraDiagnostics,`
`Diagnostics)`
Mode and number of proofs:
`base_recommender_diagnostics(+atom,+positive_integer,+list(compound),`
`+list(compound),-list(compound))` - `one`

---

valid_recommender_metadata/2

True when diagnostics metadata contains the expected model term, without instantiating the metadata.

Compilation flags:
`static`

Template:
`valid_recommender_metadata(Model,Diagnostics)`
Mode and number of proofs:
`valid_recommender_metadata(+atom,+list(compound))` - `zero_or_one`

---

valid_recommender_metadata/3

True when diagnostics metadata contains the expected model term and effective options, without instantiating the metadata.

Compilation flags:
`static`

Template:
`valid_recommender_metadata(Model,Options,Diagnostics)`
Mode and number of proofs:
`valid_recommender_metadata(+atom,+list(compound),+list(compound))` - `zero_or_one`

Public predicates

learn/3

Learns a recommender model from the given rating dataset object using the specified options.

Compilation flags:
`static`

Template:
`learn(Dataset,Recommender,Options)`
Mode and number of proofs:
`learn(+object_identifier,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

The dataset contains no ratings:

```
domain_error(non_empty_ratings,Dataset)
```

A user or item identifier is a variable:

```
instantiation_error
```

A user or item identifier is not atomic:

```
type_error(atomic,Identifier)
```

The same `User-Item` pair is rated more than once:

```
domain_error(duplicate_rating,User-Item)
```

The declared rating count is a variable:

```
instantiation_error
```

The declared rating count is neither a variable nor an integer:

```
type_error(integer,DeclaredCount)
```

The declared rating count is an integer but is not positive:

```
domain_error(positive_integer,DeclaredCount)
```

The declared and observed rating counts differ:

```
consistency_error(rating_count,DeclaredCount,ObservedCount)
```

A rating value is not a number:

```
type_error(number,Rating)
```

A scale bound is a variable:

```
instantiation_error
```

A scale bound is not numeric:

```
type_error(number,Bound)
```

Scale bounds are reversed:

```
domain_error(rating_scale,Min-Max)
```

A rating value falls outside the declared rating scale:

```
domain_error(rating_scale(Min,Max),Rating)
```

A content-based dataset has no catalog items:

```
domain_error(non_empty_catalog,Dataset)
```

A catalog or content item is declared more than once:

```
domain_error(duplicate_item,Item)
```

Content declarations do not cover the catalog exactly once:

```
domain_error(item_content_coverage,Dataset)
```

A rated item is absent from the content catalog:

```
domain_error(catalog_item,Item)
```

A content descriptor is invalid:

```
domain_error(item_content,Content)
```

Content representations are mixed:

```
domain_error(content_representation,Content)
```

A content list is not a proper list:

```
type_error(list,List)
```

A content descriptor, list, feature, or weight is a variable:

```
instantiation_error
```

A vector entry is not a pair:

```
type_error(pair,Entry)
```

A sparse vector repeats a feature key:

`domain_error(duplicate_feature,Feature)`

A sparse weight is not a number:

`type_error(number,Weight)`

A sparse weight is negative or nonfinite:

`domain_error(non_negative_finite_weight,Weight)`

A vector weight is not binary for an implementation requiring binary features:

`domain_error(binary_weight,Weight)`

A nonzero vector count is not an integer for an implementation requiring raw term counts:

`type_error(integer,Count)`

A content-based rating is not finite:

`domain_error(finite_rating,Rating)`

A selected rating is not positive in rating-weighted profile construction:

`domain_error(positive_rating_weight,Rating)`

Feature fitting produces no vocabulary:

`domain_error(non_empty_vocabulary,Corpus)`

`learn/2`

Learns a recommender model from the given rating dataset object using default options.

Compilation flags:

`static`

Template:

`learn(Dataset,Recommender)`

Mode and number of proofs:

`learn(+object_identifier,-compound)` - `one_or_error`

Exceptions:

The dataset contains no ratings:

`domain_error(non_empty_ratings,Dataset)`

A user or item identifier is a variable:

`instantiation_error`

A user or item identifier is not atomic:

`type_error(atomic,Identifier)`

The same `User-Item` pair is rated more than once:

`domain_error(duplicate_rating,User-Item)`

The declared rating count is a variable:

`instantiation_error`

The declared rating count is neither a variable nor an integer:

`type_error(integer,DeclaredCount)`

The declared rating count is an integer but is not positive:

`domain_error(positive_integer,DeclaredCount)`

The declared and observed rating counts differ:

`consistency_error(rating_count,DeclaredCount,ObservedCount)`

A rating value is not a number:

`type_error(number,Rating)`

A scale bound is a variable:

```
instantiation_error
```

A scale bound is not numeric:

```
type_error(number,Bound)
```

Scale bounds are reversed:

```
domain_error(rating_scale,Min-Max)
```

A rating value falls outside the declared rating scale:

```
domain_error(rating_scale(Min,Max),Rating)
```

A content-based dataset has no catalog items:

```
domain_error(non_empty_catalog,Dataset)
```

A catalog or content item is declared more than once:

```
domain_error(duplicate_item,Item)
```

Content declarations do not cover the catalog exactly once:

```
domain_error(item_content_coverage,Dataset)
```

A rated item is absent from the content catalog:

```
domain_error(catalog_item,Item)
```

A content descriptor is invalid:

```
domain_error(item_content,Content)
```

Content representations are mixed:

```
domain_error(content_representation,Content)
```

A content list is not a proper list:

```
type_error(list,List)
```

A content descriptor, list, feature, or weight is a variable:

```
instantiation_error
```

A vector entry is not a pair:

```
type_error(pair,Entry)
```

A sparse vector repeats a feature key:

```
domain_error(duplicate_feature,Feature)
```

A sparse weight is not a number:

```
type_error(number,Weight)
```

A sparse weight is negative or nonfinite:

```
domain_error(non_negative_finite_weight,Weight)
```

A vector weight is not binary for an implementation requiring binary features:

```
domain_error(binary_weight,Weight)
```

A nonzero vector count is not an integer for an implementation requiring raw term counts:

```
type_error(integer,Count)
```

A content-based rating is not finite:

```
domain_error(finite_rating,Rating)
```

A selected rating is not positive in rating-weighted profile construction:

```
domain_error(positive_rating_weight,Rating)
```

Feature fitting produces no vocabulary:

```
domain_error(non_empty_vocabulary,Corpus)
```

score/4

Scores the relevance of `Item` to `User` using the learned recommender. Higher scores indicate greater relevance. Scores may be predicted ratings or other relevance measures; their ranges and handling of unknown identifiers depend on the implementation.

Compilation flags:

`static`

Template:

`score(Recommender,User,Item,Score)`

Mode and number of proofs:

`score(+compound,+atomic,+atomic,-number)` - `one_or_error`

Exceptions:

`Recommender` is a variable:

`instantiation_error`

`Recommender` is not a valid recommender:

`domain_error(recommender,Recommender)`

A user or item identifier is a variable:

`instantiation_error`

A user or item identifier is not atomic:

`type_error(atomic,Identifier)`

`Item` is unknown to an implementation requiring catalog membership:

`domain_error(catalog_item,Item)`

---

recommend/4

Recommends up to `N` items to `User` using the learned recommender model, as a list of `Item-Score` pairs sorted by decreasing score. Whether items already rated by `User` are excluded, and how ties and an unknown `User` are handled, depends on the implementation.

Compilation flags:

`static`

Template:

`recommend(Recommender,User,N,Recommendations)`

Mode and number of proofs:

`recommend(+compound,+atomic,+positive_integer,-list(pair))` - `one_or_error`

Exceptions:

`Recommender` is a variable:

`instantiation_error`

`Recommender` is not a valid recommender:

`domain_error(recommender,Recommender)`

`N` is a variable:

`instantiation_error`

`N` is neither a variable nor an integer:

`type_error(integer,N)`

`N` is an integer but is not positive:
```
domain_error(positive_integer,N)
```
`User` is a variable:
```
instantiation_error
```
`User` is not atomic:
```
type_error(atomic,User)
```

---

check_recommender/1

Checks model data and diagnostics for the receiving implementation without instantiating the recommender. Throws an exception when the term is not a valid recommender representation.

Compilation flags:
```
static
```

Template:
```
check_recommender(Recommender)
```
Mode and number of proofs:
```
check_recommender(@compound) - one_or_error
```

Exceptions:
`Recommender` is a variable:
```
instantiation_error
```
`Recommender` is neither a variable nor a valid recommender:
```
domain_error(recommender,Recommender)
```

---

valid_recommender/1

True when a learned recommender term is structurally valid for the receiving implementation. Succeeds iff `check_recommender/1` succeeds without throwing an exception.

Compilation flags:
```
static
```

Template:
```
valid_recommender(Recommender)
```
Mode and number of proofs:
```
valid_recommender(@compound) - zero_or_one
```

---

diagnostics/2

Returns diagnostics metadata for a learned recommender.

Compilation flags:
```
static
```

Template:
```
diagnostics(Recommender,Diagnostics)
```
Mode and number of proofs:
```
diagnostics(+compound,-list(compound)) - one
```

---

diagnostic/2

Enumerates individual diagnostics metadata terms for a learned recommender.

Compilation flags:
```
static
```

Template:
```
diagnostic(Recommender,Diagnostic)
```
Mode and number of proofs:
```
diagnostic(+compound,?compound) - zero_or_more
```

---

recommender_options/2

Returns the effective training options recorded in a learned recommender diagnostics metadata.

Compilation flags:
```
static
```

Template:
```
recommender_options(Recommender,Options)
```
Mode and number of proofs:
```
recommender_options(+compound,-list(compound)) - one
```

---

export_to_clauses/4

Converts a recommender into a list of predicate clauses. `Functor` is the functor for the generated predicate clauses. When exporting a serialized recommender term, a noun such as `recommender` or `model` is usually clearer than a verb such as `recommend`.

Compilation flags:

```
static
```

Template:

```
export_to_clauses(Dataset,Recommender,Functor,Clauses)
```

Mode and number of proofs:

```
export_to_clauses(+object_identifier,+compound,+atom,-list(clause)) - one
```

---

export_to_file/4

Exports a recommender to a file. `Functor` is the functor for the generated predicate clauses. When exporting a serialized recommender term, a noun such as `recommender` or `model` is usually clearer than a verb such as `recommend`.

Compilation flags:

```
static
```

Template:

```
export_to_file(Dataset,Recommender,Functor,File)
```

Mode and number of proofs:

```
export_to_file(+object_identifier,+compound,+atom,+atom) - one
```

---

print_recommender/1

Prints a recommender to the current output stream in a human-readable format.

Compilation flags:

```
static
```

Template:

```
print_recommender(Recommender)
```

Mode and number of proofs:

```
print_recommender(+compound) - one
```

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

common_pairs/3

Collects the `Value1-Value2` pairs for the keys present in both sparse vectors. Assumes each vector declares at most one value per key.

Compilation flags:
`static`

Template:
`common_pairs(Vector1,Vector2,Pairs)`
Mode and number of proofs:
`common_pairs(+list(pair),+list(pair),-list(pair))` - `one`

---

vector_norm/2

Computes the Euclidean norm of the values of a sparse Key-Value vector.

Compilation flags:
`static`

Template:
`vector_norm(Vector,Norm)`
Mode and number of proofs:
`vector_norm(+list(pair),-float)` - `one`

---

scale_values/2

Scales numeric values by their maximum absolute magnitude, leaving empty and all-zero lists unchanged.

Compilation flags:
```
static
```

Template:
```
scale_values(Values,Scaled)
```
Mode and number of proofs:
```
scale_values(+list(number),-list(number)) - one
```

---

normalize_values/2

Unit-normalizes numeric values using bounded intermediate magnitudes, leaving empty and all-zero lists unchanged.

Compilation flags:
```
static
```

Template:
```
normalize_values(Values,Normalized)
```
Mode and number of proofs:
```
normalize_values(+list(number),-list(number)) - one
```

---

normalize_vector/2

Unit-normalizes a sparse numeric vector while preserving its keys and their order.

Compilation flags:
```
static
```

Template:
```
normalize_vector(Vector,Normalized)
```
Mode and number of proofs:
```
normalize_vector(+list(pair),-list(pair)) - one
```

---

bounded_similarity/2

Bounds a computed cosine or correlation score to its mathematical range, removing endpoint roundoff.

Compilation flags:
`static`

Template:
`bounded_similarity(Score,Similarity)`
Mode and number of proofs:
`bounded_similarity(+number,-number)` - `one`

---

centered_normalized_values/2

Centers and unit-normalizes numeric values in shifted, scaled coordinates. Empty lists remain empty and exactly constant lists become zeros.

Compilation flags:
`static`

Template:
`centered_normalized_values(Values,Normalized)`
Mode and number of proofs:
`centered_normalized_values(+list(number),-list(number))` - `one`

---

split_pairs/3

Splits a list of `Value1-Value2` pairs into separate, position-aligned lists of first and second values.

Compilation flags:
`static`

Template:
`split_pairs(Pairs,Values1,Values2)`
Mode and number of proofs:
`split_pairs(+list(pair),-list(number),-list(number))` - `one`

---

dot_product/3

Computes the dot product of two position-aligned numeric lists of the same length.

Compilation flags:
`static`

Template:
`dot_product(Values1,Values2,Dot)`
Mode and number of proofs:
`dot_product(+list(number),+list(number),-number)` - `one`

---

sum_of_squares_list/2

Computes the sum of the squares of a numeric list.

Compilation flags:
`static`

Template:
`sum_of_squares_list(Values,SumSquares)`
Mode and number of proofs:
`sum_of_squares_list(+list(number),-number)` - `one`

---

mean_values/2

Computes the arithmetic mean of a non-empty numeric list.

Compilation flags:
`static`

Template:
`mean_values(Values,Mean)`
Mode and number of proofs:
`mean_values(+list(number),-float)` - `one_or_error`

Exceptions:
`Values` is empty:
`evaluation_error(zero_divisor)`

`center/3`

Subtracts a value (typically the mean) from every element of a numeric list.

Compilation flags:
`static`

Template:
`center(Values,Value,Centered)`
Mode and number of proofs:
`center(+list(number),+number,-list(number))` - `one`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
protocol

1.276.11 `similarity_metric_protocol`

Protocol for pluggable similarity metrics between two sparse vectors, used to compare two users (by their item ratings) or two items (by the ratings they received).

Availability:
`logtalk_load(recommender_protocols(loader))`

Author: Paulo Moura
Version: 1:0:0

- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

similarity/3

Computes a similarity score between two sparse vectors of `Key-Value` pairs with unique ground keys and finite numeric values, unless an implementation ignores values. Higher scores indicate greater similarity. The range and handling of empty or non-overlapping vectors depend on the implementation.

Compilation flags:
`static`

Template:
`similarity(Vector1,Vector2,Similarity)`
Mode and number of proofs:
`similarity(+list(pair),+list(pair),-number)` - `one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
object

1.276.12 spearman_similarity

Spearman rank correlation over common keys, using average ranks for numeric ties. Results range from -1.0 to 1.0. Fewer than two common keys or constant common values in either vector gives 0.0. Each key must occur at most once per vector.

Public predicates

recorda/3

Adds a term as the first term for the given key, returning its reference.

Compilation flags:
`static`

Template:
`recorda(Key,Term,Reference)`

Mode and number of proofs:
`recorda(+recorded_database_key,+term,--recorded_database_reference)` - `one_or_error`

Exceptions:
`Key` is a variable:
`instantiation_error`
`Key` is neither a variable nor an atomic term or compound term:
`type_error(recorded_database_key,Key)`
`Reference` is a not a variable:
`uninstantiation_error(Reference)`

recorda/2

Adds a term as the first term for the given key.

Compilation flags:
`static`

Template:
`recorda(Key,Term)`
Mode and number of proofs:
`recorda(+recorded_database_key,+term)` - `one_or_error`

Exceptions:
`Key` is a variable:
`instantiation_error`
`Key` is neither a variable nor an atomic term or compound term:
`type_error(recorded_database_key,Key)`

---

recordz/3

Adds a term as the last term for the given key, returning its reference.

Compilation flags:
`static`

Template:
`recordz(Key,Term,Reference)`
Mode and number of proofs:
`recordz(+recorded_database_key,+term,--recorded_database_reference)` - `one_or_error`

Exceptions:
`Key` is a variable:
`instantiation_error`
`Key` is neither a variable nor an atomic term or compound term:
`type_error(recorded_database_key,Key)`
`Reference` is a not a variable:
`uninstantiation_error(Reference)`

---

recordz/2

Adds a term as the last term for the given key.

Compilation flags:
`static`

Template:
`recordz(Key,Term)`
Mode and number of proofs:
`recordz(+recorded_database_key,+term)` - `one_or_error`

Exceptions:
`Key` is a variable:
`instantiation_error`
`Key` is neither a variable nor an atomic term or compound term:
`type_error(recorded_database_key,Key)`

---

recorded/3

Enumerates, by backtracking, all record key-term pairs and their references.

Compilation flags:
`static`

Template:
`recorded(Key,Term,Reference)`
Mode and number of proofs:
`recorded(?recorded_database_key,?term,-recorded_database_reference)` - `zero_or_more`
`recorded(?recorded_database_key,?term,+recorded_database_reference)` - `zero_or_one`

---

recorded/2

Enumerates, by backtracking, all record key-term pairs.

Compilation flags:
`static`

Template:
`recorded(Key,Term)`
Mode and number of proofs:
`recorded(?recorded_database_key,?term)` - `zero_or_more`

---

erase/1

Erases the record indexed by the given reference. Fails if there is no record with the given reference.

Compilation flags:
`static`

Template:
`erase(Reference)`
Mode and number of proofs:
`erase(@recorded_database_reference)` - `zero_or_one_or_error`

Exceptions:
`Reference` is a variable:
`instantiation_error`

---

instance/2

.

Compilation flags:
`static`

Template:
`instance(Reference,Term)`
Mode and number of proofs:
`instance(@recorded_database_reference,?term)` - `zero_or_one_or_error`

Exceptions:
`Reference` is a variable:
`instantiation_error`

Protected predicates

(none)

Private predicates

record_/3

Records table.

Compilation flags:
`dynamic`

Template:

```
record_(Key,Term,Reference)
```

Mode and number of proofs:

```
record_(?recorded_database_key,?term,?recorded_database_reference) - zero_or_more
```

---

reference_/1

Reference count.

Compilation flags:

```
dynamic
```

Template:

```
reference_(Reference)
```

Mode and number of proofs:

```
reference_(?non_negative_integer) - zero_or_one
```

Operators

(none)

1.278 redis

object

1.278.1 redis

Redis client library with support for strings, keys, hashes, lists, sets, and sorted sets. Inspired by Sean Charles GNU Prolog Redis client.

Availability:

```
logtalk_load(redis(loader))
```

Author: Paulo Moura
Version: 0:7:0
Date: 2026-02-10

Compilation flags:

```
static, context_switching_calls
```

Provides:

logtalk::message_tokens//2

Uses:

list
logtalk
socket

Remarks:

- Command representation: Use the Redis command name as the functor of a compound term where the arguments are the command arguments.
- Valid arguments: Atoms, integers, and floats. Always use atoms instead of double-quoted "strings". This helps portability by not depending on the value of the `double_quotes` flag.
- Wrapper predicates: The library provides convenient wrapper predicates for common Redis operations. For operations without a wrapper, use the generic `send/3` predicate.

Inherited public predicates:

(none)

Public predicates

connect/1

Connect to a Redis server running on localhost using the default 6379 port.

Compilation flags:
```
static
```

Template:
```
connect(Connection)
```
Mode and number of proofs:
```
connect(--ground) - one
```

---

connect/3

Connect to a Redis server running on the given host and port.

Compilation flags:
```
static
```

Template:
```
connect(Host,Port,Connection)
```
Mode and number of proofs:

```
connect(+atom,+integer,--ground) - one
```

---

disconnect/1

Disconnect from a Redis server.

Compilation flags:

```
static
```

Template:

```
disconnect(Connection)
```

Mode and number of proofs:

```
disconnect(++ground) - one
```

---

send/3

Sends a request to the a Redis server and returns its reply.

Compilation flags:

```
static
```

Template:

```
send(Connection,Request,Reply)
```

Mode and number of proofs:

```
send(++ground,++callable,--callable) - one
```

---

console/1

Sends a request to a Redis server running on localhost at the default 6379 port and prints the reply.

Compilation flags:

```
static
```

Template:

```
console(Request)
```

Mode and number of proofs:

```
console(++callable) - one
```

---

get/3

Gets the value of a key.

Compilation flags:
```
static
```

Template:
```
get(Connection,Key,Value)
```
Mode and number of proofs:
```
get(+ground,+atom,-atom) - one
```

---

set/4

Sets the value of a key.

Compilation flags:
```
static
```

Template:
```
set(Connection,Key,Value,Status)
```
Mode and number of proofs:
```
set(+ground,+atom,+ground,-atom) - one
```

---

append/4

Appends a value to a key. Returns the length of the string after the append.

Compilation flags:
```
static
```

Template:
```
append(Connection,Key,Value,Length)
```
Mode and number of proofs:
```
append(+ground,+atom,+ground,-integer) - one
```

---

getrange/5

Gets a substring of the string stored at a key.

Compilation flags:
```
static
```

Template:
```
getrange(Connection,Key,Start,End,Substring)
```
Mode and number of proofs:
```
getrange(+ground,+atom,+integer,+integer,-atom) - one
```

---

setrange/5

Overwrites part of a string at a key starting at the specified offset. Returns the length of the string after modification.

Compilation flags:
```
static
```

Template:
```
setrange(Connection,Key,Offset,Value,Length)
```
Mode and number of proofs:
```
setrange(+ground,+atom,+integer,+ground,-integer) - one
```

---

strlen/3

Gets the length of the value stored at a key.

Compilation flags:
```
static
```

Template:
```
strlen(Connection,Key,Length)
```
Mode and number of proofs:
```
strlen(+ground,+atom,-integer) - one
```

---

mget/3

Gets the values of multiple keys. Returns a list of values.

Compilation flags:
```
static
```

Template:
```
mget(Connection,Keys,Values)
```
Mode and number of proofs:
```
mget(+ground,+list(atom),-list) - one
```

---

mset/3

Sets multiple key-value pairs. Pairs should be provided as a flat list [Key1, Value1, Key2, Value2, ...].

Compilation flags:
```
static
```

Template:
```
mset(Connection,Pairs,Status)
```
Mode and number of proofs:
```
mset(+ground,+list,-atom) - one
```

---

incr/3

Increments the integer value of a key by one. Returns the value after increment.

Compilation flags:
```
static
```

Template:
```
incr(Connection,Key,Value)
```
Mode and number of proofs:
```
incr(+ground,+atom,-integer) - one
```

---

decr/3

Decrements the integer value of a key by one. Returns the value after decrement.

Compilation flags:
`static`

Template:
`decr(Connection,Key,Value)`
Mode and number of proofs:
`decr(+ground,+atom,-integer)` - `one`

---

incrby/4

Increments the integer value of a key by the specified amount. Returns the value after increment.

Compilation flags:
`static`

Template:
`incrby(Connection,Key,Increment,Value)`
Mode and number of proofs:
`incrby(+ground,+atom,+integer,-integer)` - `one`

---

decrby/4

Decrements the integer value of a key by the specified amount. Returns the value after decrement.

Compilation flags:
`static`

Template:
`decrby(Connection,Key,Decrement,Value)`
Mode and number of proofs:
`decrby(+ground,+atom,+integer,-integer)` - `one`

---

del/3

Deletes a key. Returns the number of keys removed.

Compilation flags:
```
static
```

Template:
```
del(Connection,Key,Count)
```
Mode and number of proofs:
```
del(+ground,+atom,-integer) - one
```

---

exists/3

Checks if a key exists. Returns 1 if the key exists, 0 otherwise.

Compilation flags:
```
static
```

Template:
```
exists(Connection,Key,Exists)
```
Mode and number of proofs:
```
exists(+ground,+atom,-integer) - one
```

---

keys/3

Finds all keys matching a pattern. Returns a list of keys.

Compilation flags:
```
static
```

Template:
```
keys(Connection,Pattern,Keys)
```
Mode and number of proofs:
```
keys(+ground,+atom,-list) - one
```

---

ttl/3

Gets the time to live for a key in seconds. Returns -1 if the key has no expiry, -2 if the key does not exist.

Compilation flags:
```
static
```

Template:
```
ttl(Connection,Key,Seconds)
```
Mode and number of proofs:
```
ttl(+ground,+atom,-integer) - one
```

---

expire/4

Sets a timeout on a key in seconds. Returns 1 if the timeout was set, 0 if the key does not exist.

Compilation flags:
```
static
```

Template:
```
expire(Connection,Key,Seconds,Result)
```
Mode and number of proofs:
```
expire(+ground,+atom,+integer,-integer) - one
```

---

persist/3

Removes the expiration from a key. Returns 1 if the timeout was removed, 0 if the key does not exist or has no timeout.

Compilation flags:
```
static
```

Template:
```
persist(Connection,Key,Result)
```
Mode and number of proofs:
```
persist(+ground,+atom,-integer) - one
```

---

rename/4

Renames a key. Returns status OK or error if the key does not exist.

Compilation flags:
```
static
```

Template:
```
rename(Connection,OldKey,NewKey,Status)
```
Mode and number of proofs:
```
rename(+ground,+atom,+atom,-atom) - one
```

---

type/3

Gets the type of the value stored at a key. Returns one of: string, list, set, zset, hash, stream, none.

Compilation flags:
```
static
```

Template:
```
type(Connection,Key,Type)
```
Mode and number of proofs:
```
type(+ground,+atom,-atom) - one
```

---

hset/5

Sets a field in a hash. Returns 1 if a new field was created, 0 if the field was updated.

Compilation flags:
```
static
```

Template:
```
hset(Connection,Key,Field,Value,Result)
```
Mode and number of proofs:
```
hset(+ground,+atom,+atom,+ground,-integer) - one
```

---

hget/4

Gets the value of a field in a hash.

Compilation flags:
`static`

Template:
`hget(Connection,Key,Field,Value)`
Mode and number of proofs:
`hget(+ground,+atom,+atom,-ground) - one`

---

hgetall/3

Gets all fields and values in a hash. Returns a flat list of alternating fields and values.

Compilation flags:
`static`

Template:
`hgetall(Connection,Key,FieldsValues)`
Mode and number of proofs:
`hgetall(+ground,+atom,-list) - one`

---

hdel/4

Deletes a field from a hash. Returns the number of fields removed.

Compilation flags:
`static`

Template:
`hdel(Connection,Key,Field,Count)`
Mode and number of proofs:
`hdel(+ground,+atom,+atom,-integer) - one`

---

hexists/4

Checks if a field exists in a hash. Returns 1 if the field exists, 0 otherwise.

Compilation flags:
```
static
```

Template:
```
hexists(Connection,Key,Field,Exists)
```
Mode and number of proofs:
```
hexists(+ground,+atom,+atom,-integer) - one
```

---

hkeys/3

Gets all field names in a hash.

Compilation flags:
```
static
```

Template:
```
hkeys(Connection,Key,Fields)
```
Mode and number of proofs:
```
hkeys(+ground,+atom,-list) - one
```

---

hvals/3

Gets all values in a hash.

Compilation flags:
```
static
```

Template:
```
hvals(Connection,Key,Values)
```
Mode and number of proofs:
```
hvals(+ground,+atom,-list) - one
```

---

hlen/3

Gets the number of fields in a hash.

Compilation flags:
`static`

Template:
`hlen(Connection,Key,Count)`
Mode and number of proofs:
`hlen(+ground,+atom,-integer)` - `one`

---

lpush/4

Prepends a value to a list. Returns the length of the list after the push.

Compilation flags:
`static`

Template:
`lpush(Connection,Key,Value,Length)`
Mode and number of proofs:
`lpush(+ground,+atom,+ground,-integer)` - `one`

---

rpush/4

Appends a value to a list. Returns the length of the list after the push.

Compilation flags:
`static`

Template:
`rpush(Connection,Key,Value,Length)`
Mode and number of proofs:
`rpush(+ground,+atom,+ground,-integer)` - `one`

---

lpop/3

Removes and returns the first element of a list.

Compilation flags:
```
static
```

Template:
```
lpop(Connection,Key,Value)
```
Mode and number of proofs:
```
lpop(+ground,+atom,-ground) - one
```

---

rpop/3

Removes and returns the last element of a list.

Compilation flags:
```
static
```

Template:
```
rpop(Connection,Key,Value)
```
Mode and number of proofs:
```
rpop(+ground,+atom,-ground) - one
```

---

lrange/5

Gets a range of elements from a list. Indices are zero-based.

Compilation flags:
```
static
```

Template:
```
lrange(Connection,Key,Start,Stop,Elements)
```
Mode and number of proofs:
```
lrange(+ground,+atom,+integer,+integer,-list) - one
```

---

llen/3

Gets the length of a list.

Compilation flags:

```
static
```

Template:

```
llen(Connection,Key,Length)
```

Mode and number of proofs:

```
llen(+ground,+atom,-integer) - one
```

---

lrem/5

Removes elements from a list. Count > 0: remove from head, Count < 0: remove from tail, Count = 0: remove all. Returns the number of removed elements.

Compilation flags:

```
static
```

Template:

```
lrem(Connection,Key,Count,Value,Removed)
```

Mode and number of proofs:

```
lrem(+ground,+atom,+integer,+ground,-integer) - one
```

---

ltrim/5

Trims a list to the specified range.

Compilation flags:

```
static
```

Template:

```
ltrim(Connection,Key,Start,Stop,Status)
```

Mode and number of proofs:

```
ltrim(+ground,+atom,+integer,+integer,-atom) - one
```

---

sadd/4

Adds a member to a set. Returns the number of elements added.

Compilation flags:
```
static
```

Template:
```
sadd(Connection,Key,Member,Count)
```
Mode and number of proofs:
```
sadd(+ground,+atom,+ground,-integer) - one
```

---

srem/4

Removes a member from a set. Returns the number of elements removed.

Compilation flags:
```
static
```

Template:
```
srem(Connection,Key,Member,Count)
```
Mode and number of proofs:
```
srem(+ground,+atom,+ground,-integer) - one
```

---

smembers/3

Gets all members in a set.

Compilation flags:
```
static
```

Template:
```
smembers(Connection,Key,Members)
```
Mode and number of proofs:
```
smembers(+ground,+atom,-list) - one
```

---

sismember/4

Checks if a value is a member of a set. Returns 1 if the member exists, 0 otherwise.

Compilation flags:
```
static
```

Template:
```
sismember(Connection,Key,Member,IsMember)
```
Mode and number of proofs:
```
sismember(+ground,+atom,+ground,-integer) - one
```

---

scard/3

Gets the number of members in a set.

Compilation flags:
```
static
```

Template:
```
scard(Connection,Key,Count)
```
Mode and number of proofs:
```
scard(+ground,+atom,-integer) - one
```

---

zadd/5

Adds a member with a score to a sorted set. Returns the number of elements added.

Compilation flags:
```
static
```

Template:
```
zadd(Connection,Key,Score,Member,Count)
```
Mode and number of proofs:
```
zadd(+ground,+atom,+number,+ground,-integer) - one
```

---

zrem/4

Removes a member from a sorted set. Returns the number of elements removed.

Compilation flags:

```
static
```

Template:

```
zrem(Connection,Key,Member,Count)
```

Mode and number of proofs:

```
zrem(+ground,+atom,+ground,-integer) - one
```

---

zrange/5

Gets a range of members from a sorted set, ordered from lowest to highest score.

Compilation flags:

```
static
```

Template:

```
zrange(Connection,Key,Start,Stop,Members)
```

Mode and number of proofs:

```
zrange(+ground,+atom,+integer,+integer,-list) - one
```

---

zrank/4

Gets the rank (index) of a member in a sorted set, ordered from lowest to highest score. Returns nil if the member does not exist.

Compilation flags:

```
static
```

Template:

```
zrank(Connection,Key,Member,Rank)
```

Mode and number of proofs:

```
zrank(+ground,+atom,+ground,-integer) - one
```

---

zcard/3

Gets the number of members in a sorted set.

Compilation flags:
```
static
```

Template:
```
zcard(Connection,Key,Count)
```
Mode and number of proofs:
```
zcard(+ground,+atom,-integer) - one
```

---

zscore/4

Gets the score of a member in a sorted set.

Compilation flags:
```
static
```

Template:
```
zscore(Connection,Key,Member,Score)
```
Mode and number of proofs:
```
zscore(+ground,+atom,+ground,-ground) - one
```

- *Operators*

Public predicates

attribute_values/2

Enumerates by backtracking the attributes and their possible values. For discrete attributes, `Values` is a list of possible values. For continuous (numeric) attributes, `Values` is the atom `continuous`.

Compilation flags:
`static`

Template:
`attribute_values(Attribute,Values)`
Mode and number of proofs:
`attribute_values(?atom,-list(atom))` - `zero_or_more`
`attribute_values(?atom,-atom)` - `zero_or_more`

target/1

Returns the name of the numeric target attribute.

Compilation flags:
`static`

Template:
`target(Target)`
Mode and number of proofs:
`target(-atom)` - `one`

---

example/3

Enumerates by backtracking the examples in the dataset. Each example has an `Id`, a numeric `Target` value, and a list of `Attribute-Value` pairs.

Compilation flags:
`static`

Template:
`example(Id,Target,AttributeValues)`
Mode and number of proofs:
`example(-integer,-number,-list(pair))` - `zero_or_more`

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

regressor_diagnostics_data/2

Default hook predicate for exposing diagnostics metadata from a regressor term. Importing implementations may override it when using a non-standard regressor representation.

Compilation flags:

```
static
```

Template:

```
regressor_diagnostics_data(Regressor,Diagnostics)
```

Mode and number of proofs:

```
regressor_diagnostics_data(+compound,-list(compound)) - one
```

---

regressor_export_template/4

Hook predicate that importing regressor implementations must define in order to expose the exported regressor template for a given functor.

Compilation flags:

```
static
```

Template:

```
regressor_export_template(Dataset,Regressor,Functor,Template)
```

Mode and number of proofs:

```
regressor_export_template(+object_identifier,+compound,+atom,-callable) - one
```

---

regressor_term_template/2

Hook predicate that importing regressor implementations must define in order to expose the learned regressor term template used by pretty-printing helpers.

Compilation flags:

```
static
```

Template:

```
regressor_term_template(Regressor,Template)
```

Mode and number of proofs:

```
regressor_term_template(+compound,-callable) - one
```

---

dataset_attributes/2

Collects the dataset attribute declarations as *Attribute-Values* pairs.

Compilation flags:

```
static
```

Template:

```
dataset_attributes(Dataset,Attributes)
```

Mode and number of proofs:

```
dataset_attributes(+object_identifier,-list(pair)) - one
```

---

dataset_examples/2

Collects the dataset examples as *example(Id, TargetValue, AttributeValues)* terms.

Compilation flags:

```
static
```

Template:

```
dataset_examples(Dataset,Examples)
```

Mode and number of proofs:

```
dataset_examples(+object_identifier,-list(compound)) - one
```

---

check_examples/2

Validates that the collected examples list is non-empty, only contains numeric targets, and only uses declared attributes without duplicate bindings.

Compilation flags:

```
static
```

Template:

```
check_examples(Dataset,Examples)
```

Mode and number of proofs:

```
check_examples(+object_identifier,+list) - one_or_error
```

Exceptions:

Examples is the empty list:

```
domain_error(non_empty_dataset,Dataset)
```

An example target is not numeric:

```
type_error(number,Target)
```

An example repeats a declared attribute binding:

```
domain_error(attribute_occurrences,Attribute)
```

An example contains an undeclared attribute binding:

```
domain_error(declared_attribute,Attribute)
```

---

print_regressor_template/1

Pretty-printing helper predicate used by importing regressor implementations to show the learned regressor term template.

Compilation flags:

```
static
```

Template:

```
print_regressor_template(Regressor)
```

Mode and number of proofs:

```
print_regressor_template(+compound) - one
```

---

base_regressor_diagnostics/6

Builds common diagnostics metadata terms for a learned regressor and appends regressor-specific diagnostics terms.

Compilation flags:

```
static
```

Template:

```
base_regressor_diagnostics(Model,Target,TrainingExampleCount,Options,
ExtraDiagnostics,Diagnostics)
```

Mode and number of proofs:

```
base_regressor_diagnostics(+atom,+atom,+integer,+list(compound),+list(compound),
-list(compound)) - one
```

---

valid_attribute_names/1

True when a list of attribute names is a proper list of distinct atoms.

Compilation flags:

```
static
```

Template:

```
valid_attribute_names(AttributeNames)
```

Mode and number of proofs:

```
valid_attribute_names(+list(atom)) - zero_or_one
```

---

valid_attribute_declarations/1

True when a list of attribute declarations is a proper list of distinct `Attribute-Values` pairs where values are either `continuous` or a valid discrete value list.

Compilation flags:

```
static
```

Template:

```
valid_attribute_declarations(Attributes)
```

Mode and number of proofs:

```
valid_attribute_declarations(+list(pair)) - zero_or_one
```

---

valid_discrete_values/1

True when a list of categorical values is non-empty, contains only nonvar terms, and has no duplicates.

Compilation flags:

```
static
```

Template:

```
valid_discrete_values(Values)
```

Mode and number of proofs:

```
valid_discrete_values(+list) - zero_or_one
```

---

valid_regression_encoders/1

True when a list of encoders only contains valid `continuous/3` or `categorical/2` encoder terms with distinct attributes.

Compilation flags:
`static`

Template:
`valid_regression_encoders(Encoders)`
Mode and number of proofs:
`valid_regression_encoders(+list(compound))` - `zero_or_one`

---

valid_regressor_options/1

True when a list of options is structurally valid for the receiving regressor implementation.

Compilation flags:
`static`

Template:
`valid_regressor_options(Options)`
Mode and number of proofs:
`valid_regressor_options(+list(compound))` - `zero_or_one`

---

valid_regressor_metadata/2

True when diagnostics metadata contains the expected model term and records a structurally valid effective options list.

Compilation flags:
`static`

Template:
`valid_regressor_metadata(Model,Diagnostics)`
Mode and number of proofs:
`valid_regressor_metadata(+atom,+list(compound))` - `zero_or_one`

---

valid_diagnostic_count/3

True when diagnostics contains a count term with the given functor and integer value.

Compilation flags:
`static`

Template:
`valid_diagnostic_count(Functor,Diagnostics,Count)`
Mode and number of proofs:
`valid_diagnostic_count(+atom,+list(compound),+integer)` - `zero_or_one`

---

valid_linear_model_diagnostics/1

True when diagnostics contains structurally valid linear-model optimization metadata terms for convergence, completed iterations, and final parameter delta.

Compilation flags:
`static`

Template:
`valid_linear_model_diagnostics(Diagnostics)`
Mode and number of proofs:
`valid_linear_model_diagnostics(+list(compound))` - `zero_or_one`

---

valid_encoded_rows/2

True when encoded training rows match the feature count induced by the encoders and carry numeric targets.

Compilation flags:
`static`

Template:
`valid_encoded_rows(Encoders,Rows)`
Mode and number of proofs:
`valid_encoded_rows(+list(compound),+list)` - `zero_or_one`

---

encoded_feature_count/2

Counts the number of numeric features induced by a list of continuous and categorical encoders, including missing-value indicator features.

Compilation flags:

```
static
```

Template:

```
encoded_feature_count(Encoders,FeatureCount)
```

Mode and number of proofs:

```
encoded_feature_count(+list(compound),-integer) - one
```

---

continuous_stats/5

Computes the mean and scaling factor used to encode a continuous attribute from the training examples according to the effective feature scaling option.

Compilation flags:

```
static
```

Template:

```
continuous_stats(Attribute,Examples,Options,Mean,Scale)
```

Mode and number of proofs:

```
continuous_stats(+atom,+list(compound),+list(compound),-float,-positive_float) -
one
```

---

examples_to_rows/3

Encodes dataset examples as numeric feature-vector and target pairs using a list of encoders.

Compilation flags:

```
static
```

Template:

```
examples_to_rows(Examples,Encoders,Rows)
```

Mode and number of proofs:

```
examples_to_rows(+list(compound),+list(compound),-list(pair)) - one
```

---

encode_instance/3

Validates and encodes an attribute-value list as a numeric feature vector using a list of continuous and categorical encoders.

Compilation flags:

```
static
```

Template:

```
encode_instance(Encoders,AttributeValues,Features)
```

Mode and number of proofs:

```
encode_instance(+list(compound),+list(pair),-list(float)) - one
```

---

fit_linear_model/7

Builds linear-model encoders from the training dataset, encodes the examples, fits an ordinary least-squares bias plus weight vector using the linear_algebra least-squares solver, and returns solver diagnostics terms.

Compilation flags:

```
static
```

Template:

```
fit_linear_model(Dataset,Options,Encoders,TrainingExampleCount,Bias,Weights,
TrainingDiagnostics)
```

Mode and number of proofs:

```
fit_linear_model(+object_identifier,+list(compound),-list(compound),-integer,
-float,-list(float),-list(compound)) - one
```

---

fit_ridge_model/7

Builds linear-model encoders from the training dataset, encodes the examples, fits a bias plus weight vector by solving the ridge normal equations with partial pivoting, and returns ridge-specific diagnostics terms.

Compilation flags:

```
static
```

Template:

```
fit_ridge_model(Dataset,Options,Encoders,TrainingExampleCount,Bias,Weights,
TrainingDiagnostics)
```

Mode and number of proofs:

```
fit_ridge_model(+object_identifier,+list(compound),-list(compound),-integer,
-float,-list(float),-list(compound)) - one
```

---

valid_feature_labels/1

True when a list of regression-tree feature labels only contains valid `feature/2` terms.

Compilation flags:
`static`

Template:
`valid_feature_labels(FeatureLabels)`
Mode and number of proofs:
`valid_feature_labels(+list(compound))` - `zero_or_one`

---

valid_regression_tree/2

True when a regression tree only contains valid `leaf/1` and `node/5` terms using feature indexes within bounds.

Compilation flags:
`static`

Template:
`valid_regression_tree(Tree,FeatureCount)`
Mode and number of proofs:
`valid_regression_tree(+compound,+positive_integer)` - `zero_or_one`

Private predicates

check_attribute_declarations/1

Checks that dataset attribute declarations use distinct attribute names and valid value domains.

Compilation flags:
`static`

Template:
`check_attribute_declarations(Attributes)`
Mode and number of proofs:
`check_attribute_declarations(+list(pair))` - `one_or_error`

Exceptions:
An attribute is declared more than once or uses an invalid value domain:
`domain_error(attribute_declarations,Attribute)`

---

known_attribute_values/3

Collects the known numeric values for a continuous attribute from the training examples, skipping omitted and variable values.

Compilation flags:
```
static
```

Template:
```
known_attribute_values(Examples,Attribute,Values)
```
Mode and number of proofs:
```
known_attribute_values(+list(compound),+atom,-list(number)) - one
```

---

check_attribute_bindings/2

Checks that an attribute-value list contains only declared attributes and does not repeat any declared attribute; omitted declared attributes are allowed and treated as missing values.

Compilation flags:
```
static
```

Template:
```
check_attribute_bindings(AttributeNames,AttributeValues)
```
Mode and number of proofs:
```
check_attribute_bindings(+list(atom),+list(pair)) - one
```

---

check_declared_attribute_bindings/2

Checks that no declared attribute appears more than once in an attribute-value list.

Compilation flags:
```
static
```

Template:
```
check_declared_attribute_bindings(AttributeNames,AttributeValues)
```
Mode and number of proofs:
```
check_declared_attribute_bindings(+list(atom),+list(pair)) - one
```

---

check_undeclared_attribute_bindings/2

Checks that every attribute occurring in an attribute-value list is declared.

Compilation flags:
```
static
```

Template:
```
check_undeclared_attribute_bindings(AttributeValues,AttributeNames)
```
Mode and number of proofs:
```
check_undeclared_attribute_bindings(+list(pair),+list(atom)) - one
```

---

attribute_occurrences/4

Counts the number of times an attribute occurs in an attribute-value list.

Compilation flags:
```
static
```

Template:
```
attribute_occurrences(AttributeValues,Attribute,Count0,Count)
```
Mode and number of proofs:
```
attribute_occurrences(+list(pair),+atom,+integer,-integer) - one
```

---

declared_attribute_names/2

Collects the declared attribute names from dataset attribute declarations.

Compilation flags:
```
static
```

Template:
```
declared_attribute_names(Attributes,AttributeNames)
```
Mode and number of proofs:
```
declared_attribute_names(+list(pair),-list(atom)) - one
```

---

encoder_attribute_names/2

Collects the declared attribute names from a list of regression encoders.

Compilation flags:
```
static
```

Template:
```
encoder_attribute_names(Encoders,AttributeNames)
```
Mode and number of proofs:
```
encoder_attribute_names(+list(compound),-list(atom)) - one
```

---

encode_instance_checked/3

Encodes an already validated attribute-value list as a numeric feature vector using a list of continuous and categorical encoders.

Compilation flags:
```
static
```

Template:
```
encode_instance_checked(Encoders,AttributeValues,Features)
```
Mode and number of proofs:
```
encode_instance_checked(+list(compound),+list(pair),-list(float)) - one
```

---

valid_linear_model_convergence/1

True when a linear-model optimization stop reason is recognized.

Compilation flags:
```
static
```

Template:
```
valid_linear_model_convergence(Convergence)
```
Mode and number of proofs:
```
valid_linear_model_convergence(+atom) - zero_or_one
```

---

normalize_continuous/4

Normalizes a continuous value using a stored mean and scale.

Compilation flags:
```
static
```

Template:
```
normalize_continuous(Value,Mean,Scale,Feature)
```
Mode and number of proofs:
```
normalize_continuous(+number,+float,+positive_float,-float) - one
```

---

check_categorical_value/3

Validates that a categorical value is declared for an attribute.

Compilation flags:
```
static
```

Template:
```
check_categorical_value(Attribute,Values,Value)
```
Mode and number of proofs:
```
check_categorical_value(+atom,+list,+nonvar) - one
```

---

one_hot_encode/4

Encodes a declared categorical value using reference-level dummy coding plus a trailing missing-value indicator feature set to zero.

Compilation flags:
```
static
```

Template:
```
one_hot_encode(Values,Value,Encoded,Tail)
```
Mode and number of proofs:
```
one_hot_encode(+list,+nonvar,-list(float),+list(float)) - one
```

---

missing_one_hot_encode/3

Encodes a missing categorical value as reference-level dummy zeroes plus a trailing missing-value indicator feature set to one.

Compilation flags:

```
static
```

Template:

```
missing_one_hot_encode(Values,Encoded,Tail)
```

Mode and number of proofs:

```
missing_one_hot_encode(+list,-list(float),+list(float)) - one
```

---

zero_vector_from_values/3

Creates a zero vector with one element per supplied categorical value slot.

Compilation flags:

```
static
```

Template:

```
zero_vector_from_values(Values,Zeroes,Tail)
```

Mode and number of proofs:

```
zero_vector_from_values(+list,-list(float),+list(float)) - one
```

---

build_linear_encoders/4

Builds the encoder list used by linear models from dataset attribute declarations, training examples, and the effective feature scaling option.

Compilation flags:

```
static
```

Template:

```
build_linear_encoders(Attributes,Examples,Options,Encoders)
```

Mode and number of proofs:

```
build_linear_encoders(+list(pair),+list(compound),+list(compound),
-list(compound)) - one
```

---

train_linear_model/6

Fits an ordinary least-squares linear model bias and weight vector from encoded rows by delegating the solve and rank estimation to the linear_algebra library and returns solver diagnostics terms.

Compilation flags:

```
static
```

Template:

```
train_linear_model(Rows,FeatureCount,Options,Bias,Weights,TrainingDiagnostics)
```

Mode and number of proofs:

```
train_linear_model(+list(pair),+integer,+list(compound),-float,-list(float),
-list(compound)) - one
```

---

rows_to_design_matrix/3

Transforms encoded training rows into a row-oriented design matrix with a leading intercept column and a target vector.

Compilation flags:

```
static
```

Template:

```
rows_to_design_matrix(Rows,DesignMatrix,Targets)
```

Mode and number of proofs:

```
rows_to_design_matrix(+list(pair),-list(list(float)),-list(float)) - one
```

---

residual_sum_of_squares/4

Computes the residual sum of squares for encoded training rows and a learned intercept plus weight vector.

Compilation flags:

```
static
```

Template:

```
residual_sum_of_squares(Rows,Bias,Weights,ResidualSumOfSquares)
```

Mode and number of proofs:

```
residual_sum_of_squares(+list(pair),+float,+list(float),-float) - one
```

---

train_ridge_model/6

Fits a ridge model bias and weight vector from encoded rows by solving a direct weighted linear system and returns diagnostics terms describing the solve.

Compilation flags:

```
static
```

Template:

```
train_ridge_model(Rows,FeatureCount,Options,Bias,Weights,TrainingDiagnostics)
```

Mode and number of proofs:

```
train_ridge_model(+list(pair),+integer,+list(compound),-float,-list(float),
-list(compound)) - one
```

---

ridge_feature_statistics/3

Computes per-feature ridge penalty weights and active-feature flags from encoded training rows, dropping zero-variance columns from the direct solve.

Compilation flags:

```
static
```

Template:

```
ridge_feature_statistics(Rows,PenaltyWeights,ActiveFlags)
```

Mode and number of proofs:

```
ridge_feature_statistics(+list(pair),-list(float),-list(atom)) - one
```

---

accumulate_feature_statistics/5

Accumulates per-feature sums and squared sums over encoded training rows.

Compilation flags:

```
static
```

Template:

```
accumulate_feature_statistics(Rows,Sums0,SumSquares0,Sums,SumSquares)
```

Mode and number of proofs:

```
accumulate_feature_statistics(+list(pair),+list(float),+list(float),-list(float),
-list(float)) - one
```

---

add_squared_vector/3

Adds the element-wise squares of a feature vector to an accumulated vector.

Compilation flags:

```
static
```

Template:

```
add_squared_vector(Features,AccumulatedSquares0,AccumulatedSquares)
```

Mode and number of proofs:

```
add_squared_vector(+list(float),+list(float),-list(float)) - one
```

---

feature_penalty_profiles/5

Builds ridge penalty weights and active-feature flags from per-feature sums and squared sums.

Compilation flags:

```
static
```

Template:

```
feature_penalty_profiles(Sums,SumSquares,Count,PenaltyWeights,ActiveFlags)
```

Mode and number of proofs:

```
feature_penalty_profiles(+list(float),+list(float),+integer,-list(float),
-list(atom)) - one
```

---

active_feature_count/2

Counts the number of active encoded features retained for the direct ridge solve.

Compilation flags:

```
static
```

Template:

```
active_feature_count(ActiveFlags,Count)
```

Mode and number of proofs:

```
active_feature_count(+list(atom),-integer) - one
```

---

compress_rows/3

Filters encoded training rows down to the active feature subset selected for the direct ridge solve.

Compilation flags:
```
static
```

Template:
```
compress_rows(Rows,ActiveFlags,CompressedRows)
```
Mode and number of proofs:
```
compress_rows(+list(pair),+list(atom),-list(pair)) - one
```

---

compress_features/3

Filters a feature vector down to the active feature subset selected for the direct ridge solve.

Compilation flags:
```
static
```

Template:
```
compress_features(Features,ActiveFlags,CompressedFeatures)
```
Mode and number of proofs:
```
compress_features(+list(float),+list(atom),-list(float)) - one
```

---

compress_vector/3

Filters a numeric vector down to the active positions selected for the direct ridge solve.

Compilation flags:
```
static
```

Template:
```
compress_vector(Vector,ActiveFlags,CompressedVector)
```
Mode and number of proofs:
```
compress_vector(+list(float),+list(atom),-list(float)) - one
```

---

build_ridge_system/5

Builds the regularized linear system for the intercept plus active ridge coefficients.

Compilation flags:

```
static
```

Template:

```
build_ridge_system(Rows,PenaltyWeights,Regularization,Matrix,Vector)
```

Mode and number of proofs:

```
build_ridge_system(+list(pair),+list(float),+float,-list(list(float)),
-list(float)) - one
```

---

accumulate_ridge_system/5

Accumulates the unregularized normal-equation matrix and target vector for a set of active encoded rows.

Compilation flags:

```
static
```

Template:

```
accumulate_ridge_system(Rows,Matrix0,Vector0,Matrix,Vector)
```

Mode and number of proofs:

```
accumulate_ridge_system(+list(pair),+list(list(float)),+list(float),
-list(list(float)),-list(float)) - one
```

---

add_outer_product/4

Adds the outer product of two vectors to an accumulated matrix.

Compilation flags:

```
static
```

Template:

```
add_outer_product(Vector1,Vector2,Matrix0,Matrix)
```

Mode and number of proofs:

```
add_outer_product(+list(float),+list(float),+list(list(float)),
-list(list(float))) - one
```

---

regularize_ridge_matrix/4

Adds the ridge penalty weights to the feature-feature diagonal block of a linear system matrix.

Compilation flags:
`static`

Template:
`regularize_ridge_matrix(Matrix0,PenaltyWeights,Regularization,Matrix)`
Mode and number of proofs:
`regularize_ridge_matrix(+list(list(float)),+list(float),+float,-list(list(float)))` - `one`

---

solve_linear_system/4

Solves a square linear system using partial pivoting Gaussian elimination and returns the solver name.

Compilation flags:
`static`

Template:
`solve_linear_system(Matrix,Vector,Solution,Solver)`
Mode and number of proofs:
`solve_linear_system(+list(list(float)),+list(float),-list(float),-atom)` - `one_or_error`

Exceptions:
The linear system is singular because a pivot coefficient becomes numerically zero:
`evaluation_error(zero_divisor)`

---

augment_rows/3

Pairs each matrix row with its corresponding right-hand-side value for elimination.

Compilation flags:
`static`

Template:
`augment_rows(Matrix,Vector,Rows)`
Mode and number of proofs:
`augment_rows(+list(list(float)),+list(float),-list(compound))` - `one`

---

triangularize/2

Transforms an augmented matrix into upper-triangular form using partial pivoting.

Compilation flags:
```
static
```

Template:
```
triangularize(Rows0,UpperRows)
```
Mode and number of proofs:
```
triangularize(+list(compound),-list(compound)) - one_or_error
```

Exceptions:
A pivot coefficient is numerically zero during elimination:
```
evaluation_error(zero_divisor)
```

---

select_pivot_row/3

Selects the pivot row with the largest leading magnitude and returns the remaining rows.

Compilation flags:
```
static
```

Template:
```
select_pivot_row(Rows0,PivotRow,RemainingRows)
```
Mode and number of proofs:
```
select_pivot_row(+list(compound),-compound,-list(compound)) - one
```

---

leading_magnitude/2

Returns the absolute leading coefficient magnitude of an augmented row.

Compilation flags:
```
static
```

Template:
```
leading_magnitude(Row,Magnitude)
```
Mode and number of proofs:
```
leading_magnitude(+compound,-float) - one
```

---

ensure_non_zero/1

Checks that a pivot coefficient is numerically non-zero.

Compilation flags:
`static`

Template:
`ensure_non_zero(Value)`
Mode and number of proofs:
`ensure_non_zero(+float)` - `one_or_error`

Exceptions:
A pivot coefficient is numerically zero:
`evaluation_error(zero_divisor)`

---

eliminate_rows/5

Eliminates the leading coefficient from remaining augmented rows using a pivot row.

Compilation flags:
`static`

Template:
`eliminate_rows(Pivot,PivotTail,PivotValue,Rows0,Rows)`
Mode and number of proofs:
`eliminate_rows(+float,+list(float),+float,+list(compound),-list(compound))` - `one`

---

scaled_row_difference/4

Subtracts a scaled pivot tail from another row tail.

Compilation flags:
`static`

Template:
`scaled_row_difference(PivotTail,RowTail,Factor,Difference)`
Mode and number of proofs:
`scaled_row_difference(+list(float),+list(float),+float,-list(float))` - `one`

---

back_substitution/2

Performs back-substitution on an upper-triangular augmented matrix.

Compilation flags:
```
static
```

Template:
```
back_substitution(UpperRows,Solution)
```
Mode and number of proofs:
```
back_substitution(+list(compound),-list(float)) - one_or_error
```

Exceptions:

A diagonal coefficient is numerically zero during back-substitution:
```
evaluation_error(zero_divisor)
```

---

maximum_linear_system_residual/4

Computes the maximum absolute residual of a solved linear system.

Compilation flags:
```
static
```

Template:
```
maximum_linear_system_residual(Matrix,Vector,Solution,MaximumResidual)
```
Mode and number of proofs:
```
maximum_linear_system_residual(+list(list(float)),+list(float),+list(float),
-float) - one
```

---

expand_weights/3

Expands active ridge coefficients back to the full encoded feature vector, inserting zeroes for dropped zero-variance features.

Compilation flags:
```
static
```

Template:
```
expand_weights(ActiveFlags,ActiveWeights,Weights)
```
Mode and number of proofs:
```
expand_weights(+list(atom),+list(float),-list(float)) - one
```

Operators

(none)
protocol

1.279.3 regressor_protocol

Protocol for machine learning regressors.

Availability:
`logtalk_load(regression_protocols(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-05-01

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*

  - *export_to_file/4*
  - *print_regressor/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

learn/3

Learns a regressor from the given dataset object using the specified options.

Compilation flags:
`static`

Template:
`learn(Dataset,Regressor,Options)`
Mode and number of proofs:
`learn(+object_identifier,-compound,+list(compound))` - `one`

---

learn/2

Learns a regressor from the given dataset object using default options.

Compilation flags:
`static`

Template:
`learn(Dataset,Regressor)`
Mode and number of proofs:
`learn(+object_identifier,-compound)` - `one`

---

predict/3

Predicts the numeric target value for a new instance using the learned regressor. The instance is a list of `Attribute-Value` pairs.

Compilation flags:
`static`

Template:
`predict(Regressor,Instance,Target)`
Mode and number of proofs:
`predict(+compound,+list,-number)` - `one`

---

check_regressor/1

Checks that a learned regressor term is structurally valid for the receiving implementation. Throws an exception when the term is not a valid regressor representation.

Compilation flags:
`static`

Template:
`check_regressor(Regressor)`
Mode and number of proofs:
`check_regressor(@compound)` - `one_or_error`

Exceptions:
`Regressor` is a variable:
`instantiation_error`
`Regressor` is neither a variable nor a valid regressor:
`domain_error(regressor,Regressor)`

---

valid_regressor/1

True when a learned regressor term is structurally valid for the receiving implementation. Succeeds iff `check_regressor/1` succeeds without throwing an exception.

Compilation flags:
`static`

Template:
`valid_regressor(Regressor)`
Mode and number of proofs:
`valid_regressor(@compound)` - `zero_or_one`

---

diagnostics/2

Returns diagnostics metadata for a learned regressor.

Compilation flags:
`static`

Template:
`diagnostics(Regressor,Diagnostics)`
Mode and number of proofs:
`diagnostics(+compound,-list(compound))` - `one`

---

diagnostic/2

Enumerates individual diagnostics metadata terms for a learned regressor.

Compilation flags:
`static`

Template:
`diagnostic(Regressor,Diagnostic)`
Mode and number of proofs:
`diagnostic(+compound,?compound)` - `zero_or_more`

---

regressor_options/2

Returns the effective options stored in a learned regressor diagnostics metadata.

Compilation flags:
`static`

Template:
`regressor_options(Regressor,Options)`
Mode and number of proofs:
`regressor_options(+compound,-list(compound))` - `one`

---

export_to_clauses/4

Converts a regressor into a list of predicate clauses. `Functor` is the functor for the generated predicate clauses. When exporting a serialized regressor term, a noun such as `regressor` or `model` is usually clearer than a verb such as `predict`.

Compilation flags:
`static`

Template:
`export_to_clauses(Dataset,Regressor,Functor,Clauses)`
Mode and number of proofs:
`export_to_clauses(+object_identifier,+compound,+callable,-list(clause))` - `one`

---

export_to_file/4

Exports a regressor to a file. `Functor` is the functor for the generated predicate clauses. When exporting a serialized regressor term, a noun such as `regressor` or `model` is usually clearer than a verb such as `predict`.

Compilation flags:
`static`

Template:
`export_to_file(Dataset,Regressor,Functor,File)`
Mode and number of proofs:
`export_to_file(+object_identifier,+compound,+callable,+atom)` - `one`

---

print_regressor/1

Prints a regressor to the current output stream in a human-readable format.

Compilation flags:
`static`

Template:
`print_regressor(Regressor)`
Mode and number of proofs:
`print_regressor(+compound)` - `one`

1.281 regularized_bradley_terry_ranker

object

1.281.1 `regularized_bradley_terry_ranker`

Regularized Bradley-Terry MAP ranker. Learns one positive strength parameter per item from a dataset object implementing the `pairwise_ranking_dataset_protocol` protocol using a Bradley-Terry likelihood with an explicit independent Gamma prior, and returns a self-describing ranker term with diagnostics that can be used for ranking and export.

Availability:

Public predicates

path_parameter/3

Returns a named path parameter extracted by the router from the current request using deterministic lookup.

Compilation flags:

```
static
```

Template:

```
path_parameter(Request,Name,Value)
```

Mode and number of proofs:

```
path_parameter(+compound,?atom,?term) - zero_or_one
```

query_parameter/3

Returns the first named query parameter from the current request when query pairs are available.

Compilation flags:
`static`

Template:
`query_parameter(Request,Name,Value)`
Mode and number of proofs:
`query_parameter(+compound,?atom,?term)` - `zero_or_one`

---

request_header/3

Returns a normalized request header value.

Compilation flags:
`static`

Template:
`request_header(Request,Name,Value)`
Mode and number of proofs:
`request_header(+compound,?atom,?term)` - `zero_or_more`

---

request_body/2

Returns the normalized request body term.

Compilation flags:
`static`

Template:
`request_body(Request,Body)`
Mode and number of proofs:
`request_body(+compound,-compound)` - `zero_or_one`

---

json_body/2

Returns the decoded JSON payload from a normalized request body and reports a client error when the request body is missing or not decoded as JSON.

Compilation flags:

```
static
```

Template:

```
json_body(Request,JSON)
```

Mode and number of proofs:

```
json_body(+compound,-term) - one_or_error
```

Exceptions:

The normalized request body is missing or is not decoded as JSON:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected JSON
request body.)
```

---

json_object_body/2

Returns the decoded JSON payload when it is a JSON object term and reports a client error when the request body is missing, not decoded as JSON, or not an object.

Compilation flags:

```
static
```

Template:

```
json_object_body(Request,JSONObject)
```

Mode and number of proofs:

```
json_object_body(+compound,-term) - one_or_error
```

Exceptions:

The normalized request body is missing or is not decoded as JSON:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected JSON
request body.)
```

The decoded JSON payload is not a JSON object term:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected JSON object
request body.)
```

---

json_array_body/2

Returns the decoded JSON payload when it is a JSON array term and reports a client error when the request body is missing, not decoded as JSON, or not an array.

Compilation flags:

```
static
```

Template:

```
json_array_body(Request,JSONArray)
```

Mode and number of proofs:

```
json_array_body(+compound,-list) - one_or_error
```

Exceptions:

The normalized request body is missing or is not decoded as JSON:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected JSON
request body.)
```

The decoded JSON payload is not a JSON array term:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected JSON array
request body.)
```

---

form_body/2

Returns the decoded form payload from a normalized request body and reports a client error when the request body is missing or not decoded as form data.

Compilation flags:

```
static
```

Template:

```
form_body(Request,Pairs)
```

Mode and number of proofs:

```
form_body(+compound,-list(compound)) - one_or_error
```

Exceptions:

The normalized request body is missing or is not decoded as form data:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected form
request body.)
```

---

text_body/2

Returns the decoded text payload from a normalized request body and reports a client error when the request body is missing or not decoded as text.

Compilation flags:

```
static
```

Template:

```
text_body(Request,Text)
```

Mode and number of proofs:

```
text_body(+compound,-atom) - one_or_error
```

Exceptions:

The normalized request body is missing or is not decoded as text:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected text
request body.)
```

---

binary_body/2

Returns the decoded binary payload from a normalized request body and reports a client error when the request body is missing or not decoded as binary.

Compilation flags:

```
static
```

Template:

```
binary_body(Request,Bytes)
```

Mode and number of proofs:

```
binary_body(+compound,-list(integer)) - one_or_error
```

Exceptions:

The normalized request body is missing or is not decoded as binary:

```
problem(400,urn:logtalk:invalid-request-body,Bad Request,Expected binary
request body.)
```

---

json_response/4

Builds a JSON response for the given request and status descriptor, honoring any negotiated response media type annotation.

Compilation flags:

```
static
```

Template:

```
json_response(Request,Status,JSON,Response)
```

Mode and number of proofs:

`json_response(+compound,++term,++term,-compound)` - `one_or_error`

Exceptions:

`Status` is a variable or a `status(Code, Reason)` term with a variable argument:

`instantiation_error`

`Status` is an integer without a built-in reason phrase supported by the rest library:

`domain_error(http_status_code,Status)`

`Status` is neither an integer nor a valid normalized HTTP status term:

`domain_error(http_status,Status)`

`json_response/5`

Builds a JSON response for the given request and status descriptor, honoring any negotiated response media type annotation and adding the provided normalized headers.

Compilation flags:

`static`

Template:

`json_response(Request,Status,Headers,JSON,Response)`

Mode and number of proofs:

`json_response(+compound,++term,+list(compound),++term,-compound)` - `one_or_error`

Exceptions:

`Status` is a variable or a `status(Code, Reason)` term with a variable argument:

`instantiation_error`

`Status` is an integer without a built-in reason phrase supported by the rest library:

`domain_error(http_status_code,Status)`

`Status` is neither an integer nor a valid normalized HTTP status term:

`domain_error(http_status,Status)`

`Headers` is not a valid normalized header list:

`domain_error(http_headers,Headers)`

`created_response/4`

Builds a `201 Created` JSON response with a `Location` header, honoring any negotiated response media type annotation.

Compilation flags:

`static`

Template:

`created_response(Request,Location,JSON,Response)`

Mode and number of proofs:

`created_response(+compound,++term,++term,-compound)` - `one_or_error`

Exceptions:

`Location` is not a valid normalized header value:

`domain_error(http_header_value,Location)`

`no_content_response/2`

Builds a `204 No Content` response.

Compilation flags:

`static`

Template:

`no_content_response(Request,Response)`

Mode and number of proofs:

`no_content_response(+compound,-compound)` - `one_or_error`

Exceptions:

`Request` is not a valid normalized HTTP request term:

`domain_error(http_request,Request)`

`problem_response/6`

Builds an `application/problem+json` response with the standard `type`, `title`, `detail`, and numeric `status` fields.

Compilation flags:

`static`

Template:

`problem_response(Request,Status,Type,Title,Detail,Response)`

Mode and number of proofs:

`problem_response(+compound,++term,++atom,++atom,++atom,-compound)` - `one_or_error`

Exceptions:

`Status` is a variable or a `status(Code, Reason)` term with a variable argument:

`instantiation_error`

`Status` is an integer without a built-in reason phrase supported by the rest library:

`domain_error(http_status_code,Status)`

`Status` is neither an integer nor a valid normalized HTTP status term:

`domain_error(http_status,Status)`

Protected predicates

endpoint/5

Hook predicate that enumerates REST endpoint descriptors. `Id` is the endpoint identifier and must be unique within the importing object; when OpenAPI derivation is used it also becomes the operation identifier. `Method` is the lowercase HTTP method, `Path` the path template, `Action` the name of a declared local predicate with arity 2, and `Options` a list of route metadata terms plus the optional `produces(MediaTypes)` descriptor.

Compilation flags:

```
static
```

Template:

```
endpoint(Id,Method,Path,Action,Options)
```

Mode and number of proofs:

```
endpoint(?atom,?atom,?atom,?atom,?list(compound)) - zero_or_more
```

---

open_api_validate_request/1

Optional hook predicate that enables automatic OpenAPI request contract validation for the given endpoint identifier before its action predicate is called.

Compilation flags:

```
static
```

Template:

```
open_api_validate_request(Id)
```

Mode and number of proofs:

```
open_api_validate_request(?atom) - zero_or_more
```

---

open_api_request_validation_error_response/4

Optional hook predicate that customizes the response returned when OpenAPI request contract validation fails. The default implementation preserves the distinction between generic `400` request failures, `415 Unsupported Media Type`, and `422 Unprocessable Content` for invalid request bodies. The arguments are the current request, the endpoint identifier, the validation errors, and the response to send.

Compilation flags:

```
static
```

Template:

```
open_api_request_validation_error_response(Request,Id,Errors,Response)
```

Mode and number of proofs:

```
open_api_request_validation_error_response(+compound,+atom,+list,-compound) -
zero_or_one
```

---

open_api_validate_response/1

Optional hook predicate that enables automatic OpenAPI response contract validation for the given endpoint identifier after its action result is normalized into an HTTP response.

Compilation flags:

```
static
```

Template:

```
open_api_validate_response(Id)
```

Mode and number of proofs:

```
open_api_validate_response(?atom) - zero_or_more
```

---

open_api_response_validation_error_response/5

Optional hook predicate that customizes the response returned when OpenAPI response contract validation fails. The arguments are the current request, the endpoint identifier, the candidate response, the validation errors, and the response to send.

Compilation flags:

```
static
```

Template:

```
open_api_response_validation_error_response(Request,Id,Response0,Errors,Response)
```

Mode and number of proofs:

```
open_api_response_validation_error_response(+compound,+atom,+compound,+list,
-compound) - zero_or_one
```

---

rest_action_failure_response/3

Optional hook predicate that customizes the response returned when the matched endpoint action fails without throwing an exception. The arguments are the current request, the endpoint identifier, and the response to send.

Compilation flags:

```
static
```

Template:

```
rest_action_failure_response(Request,Id,Response)
```

Mode and number of proofs:

```
rest_action_failure_response(+compound,+atom,-compound) - zero_or_one
```

---

rest_action_error_response/4

Optional hook predicate that customizes the response returned when the matched endpoint action throws an unsupported exception. The arguments are the current request, the endpoint identifier, the thrown term, and the response to send.

Compilation flags:

```
static
```

Template:

```
rest_action_error_response(Request,Id,Error,Response)
```

Mode and number of proofs:

```
rest_action_error_response(+compound,+atom,+term,-compound) - zero_or_one
```

---

dispatch_rest_endpoint/2

Runs the action associated with the matched endpoint and normalizes any supported returned or thrown result term into an HTTP response.

Compilation flags:

```
static
```

Template:

```
dispatch_rest_endpoint(Request,Response)
```

Mode and number of proofs:

```
dispatch_rest_endpoint(+compound,-compound) - one_or_error
```

Exceptions:

The routed endpoint identifier is missing or unknown:

```
existence_error(rest_endpoint_id,Id)
```

The routed endpoint identifier is duplicated:

```
domain_error(rest_endpoint_id,duplicate(Id))
```

The endpoint action produces an invalid REST result term:

```
domain_error(rest_result,Result)
```

Private predicates

Operators

(none)

1.285 ridge_regression

object

1.285.1 `ridge_regression`

Ridge regression regressor supporting continuous and mixed-feature datasets using a direct weighted linear-system solve with L2 regularization. Learns from a dataset object implementing the `regression_dataset_protocol` protocol and returns a regressor term that can be used for prediction and exported as predicate clauses.

Availability:
`logtalk_load(ridge_regression(loader))`

1.286 ripple_down_rules

object

1.286.1 `generalized_ripple_down_rules`

Generalized Ripple-Down Rules implementation using keyed Single-Classification Ripple-Down Rules and Multi-Classification Ripple-Down Rules submodels.

Availability:

```
logtalk_load(ripple_down_rules(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-08

Compilation flags:

```
static, context_switching_calls
```

Implements:

`public` *ripple_down_rules_common_protocol*

Imports:

`public` *options*

Uses:

avltree
multi_classification_ripple_down_rules
single_classification_ripple_down_rules

Remarks:

(none)

Inherited public predicates:

as_list/2 check_model/1 check_option/1 check_options/1 classify/3 classify/4 default_option/1 default_options/1 new/1 new/2 option/2 option/3 revise/6 size/2 valid_model/1 valid_option/1 valid_options/1

- *Public predicates*
  - *put/4*
  - *get/3*
  - *remove/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

put/4

Returns a new Generalized Ripple-Down Rules model with the keyed Single-Classification Ripple-Down Rules or Multi-Classification Ripple-Down Rules submodel added or replaced.

Compilation flags:

```
static
```

Template:

```
put(Model,Key,Submodel,NewModel)
```

Mode and number of proofs:

```
put(+compound,+term,+compound,-compound) - one_or_error
```

Exceptions:

`Model` is a variable:

```
instantiation_error
```

`Model` is neither a variable nor a valid model:

```
domain_error(ripple_down_rules,Model)
```

`Key` is a variable:

```
instantiation_error
```

`Submodel` is a variable:

```
instantiation_error
```

`Submodel` is neither a variable nor a valid submodel:

```
domain_error(ripple_down_rules_submodel,Submodel)
```

get/3

Returns the submodel stored under a key.

Compilation flags:
`static`

Template:
`get(Model,Key,Submodel)`
Mode and number of proofs:
`get(+compound,+term,-compound)` - `zero_or_one_or_error`

Exceptions:
`Model` is a variable:
`instantiation_error`
`Model` is neither a variable nor a valid model:
`domain_error(ripple_down_rules,Model)`
`Key` is a variable:
`instantiation_error`

---

remove/3

Returns a new Generalized Ripple-Down Rules model with the keyed submodel removed.

Compilation flags:
`static`

Template:
`remove(Model,Key,NewModel)`
Mode and number of proofs:
`remove(+compound,+term,-compound)` - `zero_or_one_or_error`

Exceptions:
`Model` is a variable:
`instantiation_error`
`Model` is neither a variable nor a valid model:
`domain_error(ripple_down_rules,Model)`
`Key` is a variable:
`instantiation_error`

  - *as_list/2*
  - *size/2*
  - *check_model/1*

    - *valid_model/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

new/1

Creates an empty Ripple-Down Rules model using default options.

Compilation flags:
`static`

Template:
`new(Model)`
Mode and number of proofs:
`new(-compound)` - `one`

---

new/2

Creates an empty Ripple-Down Rules model using the given options.

Compilation flags:
`static`

Template:
`new(Model,Options)`
Mode and number of proofs:
`new(-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

classify/3

Classifies a case using a Ripple-Down Rules model.

Compilation flags:
`static`

Template:
`classify(Model,Case,Conclusion)`
Mode and number of proofs:
`classify(+compound,@term,--term)` - `one`

---

classify/4

Classifies a case and returns an ordered inference trace.

Compilation flags:
`static`

Template:
`classify(Model,Case,Conclusion,Trace)`
Mode and number of proofs:
`classify(+compound,@term,--term,-list(compound))` - `one`

---

revise/6

Returns a new model after applying one correction. The `scrdr` implementation accepts the correction atom `replace`. The `mcrdr` implementation accepts the correction atoms `add`, `remove`, and `filter`. The `grdr` implementation accepts the correction atoms supported by the keyed submodel and requires the second argument to be a `Key-Case` pair. The condition closure is called with the case and current conclusions. The conclusion closure is called with the case and current conclusions plus an output argument.

Compilation flags:
`static`

Template:
`revise(Model,Case,Correction,Condition,Conclusion,NewRDR)`
Meta-predicate template:
`revise(*,*,*,2,3,*)`
Mode and number of proofs:
`revise(+compound,@term,+atom,+callable,+callable,-compound)` - `one_or_error`

Exceptions:
`Correction` is a variable:
`instantiation_error`
`Correction` is not supported by the receiving implementation or keyed submodel:

```
domain_error(ripple_down_rule_correction,Correction)
```

---

as_list/2

Returns stable preorder descriptors for all rules in a model.

Compilation flags:

```
static
```

Template:

```
as_list(Model,Rules)
```

Mode and number of proofs:

```
as_list(+compound,-list(compound)) - one
```

---

size/2

Returns the number of rules in a model.

Compilation flags:

```
static
```

Template:

```
size(Model,Size)
```

Mode and number of proofs:

```
size(+compound,-integer) - one
```

---

check_model/1

Checks that a term is a structurally valid model for the receiving implementation.

Compilation flags:

```
static
```

Template:

```
check_model(Model)
```

Mode and number of proofs:

```
check_model(@compound) - one_or_error
```

Exceptions:

`Model` is a variable:

```
instantiation_error
```

`Model` is neither a variable nor a valid model:

```
domain_error(ripple_down_rules_model,Model)
```

`valid_model/1`

True iff the argument is a structurally valid model for the receiving implementation.

Compilation flags:
`static`

Template:
`valid_model(Model)`
Mode and number of proofs:
`valid_model(@compound)` - `zero_or_one`

Public predicates

request/6

Builds the request base URL plus signing endpoint context for an S3 operation.

Compilation flags:
`static`

Template:
`request(Operation,Bucket,Key,URL,Endpoint,Options)`

Mode and number of proofs:
`request(+atom,@atom,@atom,-atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Operation` is not a supported S3 operation:
`domain_error(s3_operation,Operation)`
`Bucket` is a variable:
`instantiation_error`
`Bucket` is neither a variable not a valid bucket:
`domain_error(s3_request,Bucket)`
`Key` is a variable:
`instantiation_error`
`Key` is neither a variable not a valid key:
`domain_error(s3_request,Key)`
`Options` contains an invalid endpoint or addressing style:
`domain_error(s3_endpoint,Endpoint)`

Remarks:

- Option `region/1`: AWS region to use when `endpoint/1` is absent. Defaults to `us-east-1`.
- Option `endpoint/1`: Optional custom S3-compatible base endpoint URL, which may include a path prefix.
- Option `addressing_style/1`: Endpoint addressing style, either `virtual_hosted` or `path`. Defaults to `virtual_hosted`.

---

canonical_uri/4

Returns the canonical request URI for an S3 operation using the selected endpoint style.

Compilation flags:
`static`

Template:
`canonical_uri(Operation,Bucket,Key,CanonicalURI)`

Mode and number of proofs:

`canonical_uri(+atom,@atom,@atom,-atom)` - `one_or_error`

Exceptions:

`Operation` is not a supported S3 operation:

`domain_error(s3_operation,Operation)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable not a valid bucket:

`domain_error(s3_request,Bucket)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable not a valid key:

`domain_error(s3_request,Key)`

`canonical_uri/5`

Returns the canonical request URI for an S3 operation using an explicit endpoint context.

Compilation flags:

`static`

Template:

`canonical_uri(Operation,Context,Bucket,Key,CanonicalURI)`

Mode and number of proofs:

`canonical_uri(+atom,+compound,@atom,@atom,-atom)` - `one_or_error`

Exceptions:

`Operation` is not a supported S3 operation:

`domain_error(s3_operation,Operation)`

`Context` is not a valid endpoint context:

`domain_error(s3_endpoint,Context)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` or `Key` is invalid for the operation:

`domain_error(s3_request,Argument)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.288.4 `s3_headers`

Helpers for extracting S3 response metadata from normalized HTTP responses.

Availability:
`logtalk_load(s3(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-09

Compilation flags:
`static, context_switching_calls`

Uses:
http_core

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *response_properties/2*
  - *header_value/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

response_properties/2

Collects status and response headers into a stable property list.

Compilation flags:
`static`

Template:
`response_properties(Response,Properties)`
Mode and number of proofs:
`response_properties(+compound,-list(compound))` - `one_or_error`

Exceptions:
`Response` is not a normalized HTTP response term:
`domain_error(http_response,Response)`

---

header_value/3

Enumerates response header values by normalized header name.

Compilation flags:
`static`

Template:
`header_value(Response,Name,Value)`
Mode and number of proofs:
`header_value(+compound,+atom,-term)` - `zero_or_more`

Exceptions:
`Response` is not a normalized HTTP response term:
`domain_error(http_response,Response)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Public predicates

list_buckets/2

Lists accessible buckets.

Compilation flags:
`static`

Template:
`list_buckets(Buckets,Options)`

Mode and number of proofs:
`list_buckets(-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Options` contains an invalid S3 client option:
`domain_error(s3_client_option,Option)`
Credentials are missing or invalid:
`domain_error(s3_credentials,missing)`
The S3 service returned a non-success status or malformed XML body:
`domain_error(s3_http_status,Status)`

Remarks:

- Option `credentials/1`: Required access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional session token for temporary credentials.
- Option `region/1`: AWS region to use when `endpoint/1` is absent. Defaults to `us-east-1`.
- Option `endpoint/1`: Optional custom S3-compatible endpoint URL.
- Option `addressing_style/1`: Endpoint addressing style, either `virtual_hosted` or `path`. Defaults to `virtual_hosted`.
- Option `headers/1`: Optional extra normalized HTTP request headers.
- Option `version/1`: HTTP protocol version as `http(Major, Minor)`. Defaults to `http(1,1)`.
- Option `properties/1`: Optional extra normalized HTTP request properties.
- Option `connection_options/1`: Optional transport-specific HTTP client options.
- Option `payload_hash_mode/1`: Payload signing mode, either `signed` or `unsigned`. Defaults to `signed`.
- Option `request_time/1`: Optional explicit local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: UTC offset used to derive the signing time from the local clock. Defaults to `0`.
- Option `amz_date/1`: Optional explicit AWS SigV4 timestamp overriding any derived request time.

head_bucket/3

Returns response metadata for a bucket.

Compilation flags:

`static`

Template:

`head_bucket(Bucket,Metadata,Options)`

Mode and number of proofs:

`head_bucket(+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

The S3 service returned a non-success status:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Supported options are the standard S3 request options: `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`, optional `session_token(Token)`, `region(Region)`, optional custom `endpoint(URL)`, `addressing_style(virtual_hosted|path)`, optional `headers(Headers)`, `version(http(Major, Minor))`, optional `properties(Properties)`, optional `connection_options(ConnectionOptions)`, `payload_hash_mode(signed|unsigned)`, optional `request_time(date_time(...))`, `utc_offset_seconds(OffsetSeconds)`, and optional explicit `amz_date(AmzDate)`.

list_objects_v2/4

Lists bucket objects using the ListObjectsV2 API.

Compilation flags:

`static`

Template:

`list_objects_v2(Bucket,Request,Listing,Options)`

Mode and number of proofs:

`list_objects_v2(+atom,+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Request` is a variable:

`instantiation_error`

An element `Option` of the request option list is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

An element `Option` of the request option list is neither a variable nor a compound term:

`type_error(compound,Option)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Request` is not a valid ListObjectsV2 request term or option list:

`domain_error(s3_list_objects_request,Request)`

An element `Option` of the request option list is a compound term but not a valid ListObjectsV2 request option:

`domain_error(s3_list_objects_request_option,Option)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

The S3 service returned a non-success status or malformed XML body:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: `Options` accepts the standard S3 request options: `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`, optional `session_token(Token)`, `region(Region)`, optional custom `endpoint(URL)`, `addressing_style(virtual_hosted|path)`, optional `headers(Headers)`, `version(http(Major, Minor))`, optional `properties(Properties)`, optional

`connection_options(ConnectionOptions)`, `payload_hash_mode(signed|unsigned)`, optional `request_time(date_time(...))`, `utc_offset_seconds(OffsetSeconds)`, and optional explicit `amz_date(AmzDate)`. The `Request` argument carries the ListObjectsV2-specific request options.

`head_object/4`

Returns response metadata for an object.

Compilation flags:

`static`

Template:

`head_object(Bucket,Key,Metadata,Options)`

Mode and number of proofs:

`head_object(+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Key` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

The S3 service returned a non-success status:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Supported options are the standard S3 request options: `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`, optional `session_token(Token)`, `region(Region)`, optional custom `endpoint(URL)`, `addressing_style(virtual_hosted|path)`, optional `headers(Headers)`, `version(http(Major, Minor))`, optional `properties(Properties)`, optional `connection_options(ConnectionOptions)`, `payload_hash_mode(signed|unsigned)`, optional

`request_time(date_time(...))`, `utc_offset_seconds(OffsetSeconds)`, and optional explicit `amz_date(AmzDate)`.

`get_object/5`

Fetches an object into a local file path and returns its response metadata as a separate argument.

Compilation flags:

`static`

Template:

`get_object(Bucket,Key,File,Properties,Options)`

Mode and number of proofs:

`get_object(+atom,+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Key` is a variable:

`instantiation_error`

`File` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`File` exists but is not a writable file:

`domain_error(file([],[write]),File)`

The directory `Directory` exists but is not writable:

`domain_error(directory([write]),Directory)`

The directory `Directory` does not exist:

`existence_error(directory,Directory)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

The S3 service returned a non-success status:
`domain_error(s3_http_status,Status)`

Remarks:

- Options: Supported options are: `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))` for access credentials; `session_token(Token)` for temporary credentials; `region(Region)` for the AWS region, defaulting to `us-east-1` when `endpoint/1` is absent; `endpoint(URL)` for a custom S3-compatible endpoint; `addressing_style(virtual_hosted|path)` for endpoint addressing, defaulting to `virtual_hosted`; `headers(Headers)` for extra normalized request headers; `version(http(Major, Minor))` for the HTTP protocol version, defaulting to `http(1,1)`; `properties(Properties)` for extra normalized HTTP request properties; `connection_options(ConnectionOptions)` for transport-specific HTTP client options; `payload_hash_mode(signed|unsigned)` for payload signing, defaulting to `signed`; `request_time(date_time(...))` for an explicit local request time; `utc_offset_seconds(OffsetSeconds)` for deriving UTC from the local clock, defaulting to `0`; and `amz_date(AmzDate)` for an explicit AWS SigV4 timestamp overriding time derivation.

`put_object/6`

Uploads a local file path and returns the object ETag and response metadata as separate arguments.

Compilation flags:
`static`

Template:
`put_object(Bucket,Key,File,ETag,Properties,Options)`

Mode and number of proofs:
`put_object(+atom,+atom,+atom,-atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Bucket` is a variable:
`instantiation_error`
`Key` is a variable:
`instantiation_error`
`File` is a variable:
`instantiation_error`
`Bucket` is neither a variable nor an atom:
`type_error(atom,Bucket)`
`Key` is neither a variable nor an atom:
`type_error(atom,Key)`
`File` is neither a variable nor an atom:
`type_error(atom,File)`
`Bucket` is an atom but not a valid S3 bucket:
`domain_error(s3_bucket,Bucket)`
`File` exists but is not a readable file:
`domain_error(file([],[read]),File)`
The file `File` does not exist:
`existence_error(file,File)`
`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

The S3 service returned a non-success status:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Supported options are the standard S3 request options: `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`, optional `session_token(Token)`, `region(Region)`, optional custom `endpoint(URL)`, `addressing_style(virtual_hosted|path)`, optional `headers(Headers)`, `version(http(Major, Minor))`, optional `properties(Properties)`, optional `connection_options(ConnectionOptions)`, `payload_hash_mode(signed|unsigned)`, optional `request_time(date_time(...))`, `utc_offset_seconds(OffsetSeconds)`, and optional explicit `amz_date(AmzDate)`.

`delete_object/4`

Deletes an object, returning `delete_result(Properties)`.

Compilation flags:

`static`

Template:

`delete_object(Bucket,Key,Result,Options)`

Mode and number of proofs:

`delete_object(+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Key` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
`Options` contains an invalid S3 client option:
`domain_error(s3_client_option,Option)`
The S3 service returned a non-success status:
`domain_error(s3_http_status,Status)`

Remarks:

- Options: Supported options are the standard S3 request options: `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`, optional `session_token(Token)`, `region(Region)`, optional custom `endpoint(URL)`, `addressing_style(virtual_hosted|path)`, optional `headers(Headers)`, `version(http(Major, Minor))`, optional `properties(Properties)`, optional `connection_options(ConnectionOptions)`, `payload_hash_mode(signed|unsigned)`, optional `request_time(date_time(...))`, `utc_offset_seconds(OffsetSeconds)`, and optional explicit `amz_date(AmzDate)`.

`copy_object/5`

Copies an object from a source bucket/key into the destination bucket/key, returning `copy_result(ETag, Properties)`.

Compilation flags:
`static`

Template:
`copy_object(Source,Bucket,Key,Result,Options)`
Mode and number of proofs:
`copy_object(+compound,+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Bucket` is a variable:
`instantiation_error`
`Key` is a variable:
`instantiation_error`
The version identifier in `Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a compound term:
`type_error(compound,Source)`
`Bucket` is neither a variable nor an atom:
`type_error(atom,Bucket)`
`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

The version identifier in `Source` is neither a variable nor an atom:

`type_error(atom,VersionId)`

`Source` is a compound term but not a valid copy source term:

`domain_error(s3_copy_source,Source)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

The version identifier in `Source` is an atom but not a valid version identifier:

`domain_error(s3_version_id,VersionId)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

The S3 service returned a non-success status or malformed XML body:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Supported options are the standard S3 request options: `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`, optional `session_token(Token)`, `region(Region)`, optional custom `endpoint(URL)`, `addressing_style(virtual_hosted|path)`, optional `headers(Headers)`, `version(http(Major, Minor))`, optional `properties(Properties)`, optional `connection_options(ConnectionOptions)`, `payload_hash_mode(signed|unsigned)`, optional `request_time(date_time(...))`, `utc_offset_seconds(OffsetSeconds)`, and optional explicit `amz_date(AmzDate)`.

`presigned_get_object/4`

Generates a presigned URL for downloading an object with an external HTTP client.

Compilation flags:

`static`

Template:

`presigned_get_object(Bucket,Key,URL,Options)`

Mode and number of proofs:

`presigned_get_object(+atom,+atom,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Key` is a variable:
```
instantiation_error
```
`Bucket` is neither a variable nor an atom:
```
type_error(atom,Bucket)
```
`Key` is neither a variable nor an atom:
```
type_error(atom,Key)
```
`Bucket` is an atom but not a valid S3 bucket:
```
domain_error(s3_bucket,Bucket)
```
`Options` is a variable:
```
instantiation_error
```
`Options` is neither a variable nor a list:
```
type_error(list,Options)
```
An element `Option` of the list `Options` is a variable:
```
instantiation_error
```
An element `Option` of the list `Options` is neither a variable nor a compound term:
```
type_error(compound,Option)
```
An element `Option` of the list `Options` is a compound term but not a valid option:
```
domain_error(option,Option)
```
`Options` contains an invalid S3 client option:
```
domain_error(s3_client_option,Option)
```
Credentials are missing or invalid:
```
domain_error(s3_credentials,missing)
```
The expiration is invalid or outside the AWS SigV4 range:
```
domain_error(s3_presign_expires,Expires)
```
The payload hash is missing, invalid, or incompatible with unsigned mode:
```
domain_error(s3_presign_payload_hash,Hash)
```

Remarks:

- Option `credentials/1`: Required access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional session token for temporary credentials.
- Option `region/1`: AWS region to use when `endpoint/1` is absent. Defaults to `us-east-1`.
- Option `endpoint/1`: Optional custom S3-compatible endpoint URL.
- Option `addressing_style/1`: Endpoint addressing style, either `virtual_hosted` or `path`. Defaults to `virtual_hosted`.
- Option `headers/1`: Optional extra normalized request headers. When present they are signed into the URL and must be reproduced by the eventual caller.
- Option `payload_hash_mode/1`: Presigned URLs default to `payload_hash_mode(unsigned)`. Use `signed` together with `payload_hash/1` to sign a precomputed payload hash.
- Option `payload_hash/1`: Precomputed hexadecimal SHA-256 payload hash required when `payload_hash_mode(signed)` is selected.
- Option `request_time/1`: Optional explicit local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: UTC offset used to derive the signing time from the local clock. Defaults to `0`.
- Option `amz_date/1`: Optional explicit AWS SigV4 timestamp overriding any derived request time.
- Option `expires/1`: Presigned URL lifetime in seconds. Defaults to `900` and must not exceed `604800`.

presigned_put_object/4

Generates a presigned URL for uploading an object with an external HTTP client.

Compilation flags:

`static`

Template:

`presigned_put_object(Bucket,Key,URL,Options)`

Mode and number of proofs:

`presigned_put_object(+atom,+atom,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Key` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

Credentials are missing or invalid:

`domain_error(s3_credentials,missing)`

The expiration is invalid or outside the AWS SigV4 range:

`domain_error(s3_presign_expires,Expires)`

The payload hash is missing, invalid, or incompatible with unsigned mode:

`domain_error(s3_presign_payload_hash,Hash)`

Remarks:

- Option `credentials/1`: Required access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional session token for temporary credentials.
- Option `region/1`: AWS region to use when `endpoint/1` is absent. Defaults to `us-east-1`.
- Option `endpoint/1`: Optional custom S3-compatible endpoint URL.
- Option `addressing_style/1`: Endpoint addressing style, either `virtual_hosted` or `path`. Defaults to `virtual_hosted`.

- Option `headers/1`: Optional extra normalized request headers. When present they are signed into the URL and must be reproduced by the eventual caller.
- Option `payload_hash_mode/1`: Presigned URLs default to `payload_hash_mode(unsigned)`. Use `signed` together with `payload_hash/1` to sign a precomputed payload hash.
- Option `payload_hash/1`: Precomputed hexadecimal SHA-256 payload hash required when `payload_hash_mode(signed)` is selected.
- Option `request_time/1`: Optional explicit local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: UTC offset used to derive the signing time from the local clock. Defaults to `0`.
- Option `amz_date/1`: Optional explicit AWS SigV4 timestamp overriding any derived request time.
- Option `expires/1`: Presigned URL lifetime in seconds. Defaults to `900` and must not exceed `604800`.

`presigned_post_object/4`

Generates a presigned URL for a POST request to an object with an external HTTP client.

Compilation flags:

`static`

Template:

`presigned_post_object(Bucket,Key,URL,Options)`

Mode and number of proofs:

`presigned_post_object(+atom,+atom,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Bucket` is a variable:

`instantiation_error`

`Key` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Options` contains an invalid S3 client option:

`domain_error(s3_client_option,Option)`

Credentials are missing or invalid:

`domain_error(s3_credentials,missing)`

The expiration is invalid or outside the AWS SigV4 range:

`domain_error(s3_presign_expires,Expires)`

The payload hash is missing, invalid, or incompatible with unsigned mode:

`domain_error(s3_presign_payload_hash,Hash)`

Remarks:

- Option `credentials/1`: Required access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional session token for temporary credentials.
- Option `region/1`: AWS region to use when `endpoint/1` is absent. Defaults to `us-east-1`.
- Option `endpoint/1`: Optional custom S3-compatible endpoint URL.
- Option `addressing_style/1`: Endpoint addressing style, either `virtual_hosted` or `path`. Defaults to `virtual_hosted`.
- Option `headers/1`: Optional extra normalized request headers. When present they are signed into the URL and must be reproduced by the eventual caller.
- Option `payload_hash_mode/1`: Presigned URLs default to `payload_hash_mode(unsigned)`. Use `signed` together with `payload_hash/1` to sign a precomputed payload hash.
- Option `payload_hash/1`: Precomputed hexadecimal SHA-256 payload hash required when `payload_hash_mode(signed)` is selected.
- Option `request_time/1`: Optional explicit local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: UTC offset used to derive the signing time from the local clock. Defaults to `0`.
- Option `amz_date/1`: Optional explicit AWS SigV4 timestamp overriding any derived request time.
- Option `expires/1`: Presigned URL lifetime in seconds. Defaults to `900` and must not exceed `604800`.

Protected predicates

  - *session_state_/2*
- *Operators*

Public predicates

get_object/6

Fetches an object into a local file path using session defaults merged with per-call options and returns its response metadata as a separate argument.

Compilation flags:

`static`

Template:

`get_object(Session,Bucket,Key,File,Properties,Options)`

Mode and number of proofs:

`get_object(+compound,+atom,+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

`File` is a variable:

`instantiation_error`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

`File` exists but is not a writable file:

`domain_error(file([],[write]),File)`

The directory `Directory` exists but is not writable:

`domain_error(directory([write]),Directory)`

The directory `Directory` does not exist:

`existence_error(directory,Directory)`

The delegated S3 client request failed:

`domain_error(s3_http_status,Status)`

Remarks:

- Option precedence: Per-call options are merged before the stored session defaults, so explicit call options take precedence.
- Option `credentials/1`: Access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional session token for temporary credentials.

- Option `region/1`: AWS region to use when `endpoint/1` is absent.
- Option `endpoint/1`: Optional custom S3-compatible endpoint URL.
- Option `addressing_style/1`: Endpoint addressing style, either `virtual_hosted` or `path`.
- Option `headers/1`: Optional extra normalized HTTP request headers.
- Option `version/1`: HTTP protocol version as `http(Major, Minor)`.
- Option `properties/1`: Optional extra normalized HTTP request properties.
- Option `connection_options/1`: Optional transport-specific HTTP client options.
- Option `payload_hash_mode/1`: Payload signing mode, either `signed` or `unsigned`.
- Option `request_time/1`: Optional explicit local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: UTC offset used to derive the signing time from the local clock.
- Option `amz_date/1`: Optional explicit AWS SigV4 timestamp overriding any derived request time.

`open/1`

Opens a new S3 client session with no default options.

Compilation flags:
`static`

Template:
`open(Session)`
Mode and number of proofs:
`open(-compound)` - `one_or_error`

Exceptions:

`open/2`

Opens a new S3 client session with the given default options.

Compilation flags:
`static`

Template:
`open(Session,Options)`
Mode and number of proofs:
`open(-compound,+list(compound))` - `one_or_error`

Exceptions:
`Options` contains an invalid S3 session option:
`domain_error(option,Option)`

Remarks:

- Option role: `Options` stores default request options reused by later session calls.

- Option `credentials/1`: Default access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional default session token for temporary credentials.
- Option `region/1`: Default AWS region to use when `endpoint/1` is absent.
- Option `endpoint/1`: Optional default custom S3-compatible endpoint URL.
- Option `addressing_style/1`: Default endpoint addressing style, either `virtual_hosted` or `path`.
- Option `headers/1`: Optional default normalized HTTP request headers.
- Option `version/1`: Default HTTP protocol version as `http(Major, Minor)`.
- Option `properties/1`: Optional default normalized HTTP request properties.
- Option `connection_options/1`: Optional default transport-specific HTTP client options.
- Option `payload_hash_mode/1`: Default payload signing mode, either `signed` or `unsigned`.
- Option `request_time/1`: Optional default local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: Default UTC offset used to derive the signing time from the local clock.
- Option `amz_date/1`: Optional default AWS SigV4 timestamp overriding any derived request time.

`close/1`

Closes a S3 client session.

Compilation flags:
`static`

Template:
`close(Session)`

Mode and number of proofs:
`close(+compound)` - `one_or_error`

Exceptions:
`Session` is a variable:
`instantiation_error`
`Session` is neither a variable nor a valid S3 session handle:
`domain_error(s3_session,Session)`
`Session` is a valid S3 session handle but not open:
`existence_error(s3_session,Session)`

`list_buckets/3`

Lists accessible buckets using session defaults merged with per-call options.

Compilation flags:
`static`

Template:
`list_buckets(Session,Buckets,Options)`

Mode and number of proofs:

```
list_buckets(+compound,-compound,+list(compound)) - one_or_error
```

Exceptions:

`Session` is a variable:

```
instantiation_error
```

`Session` is neither a variable nor a valid S3 session handle:

```
domain_error(s3_session,Session)
```

`Session` is a valid S3 session handle but not open:

```
existence_error(s3_session,Session)
```

`Options` contains an invalid S3 session option:

```
domain_error(option,Option)
```

The delegated S3 client request failed:

```
domain_error(s3_http_status,Status)
```

Remarks:

- Options: Per-call options accept the same terms as `open/2` and are merged before the stored session defaults, so explicit call options take precedence.

---

head_bucket/4

Returns bucket metadata using session defaults merged with per-call options.

Compilation flags:

```
static
```

Template:

```
head_bucket(Session,Bucket,Metadata,Options)
```

Mode and number of proofs:

```
head_bucket(+compound,+atom,-compound,+list(compound)) - one_or_error
```

Exceptions:

`Session` is a variable:

```
instantiation_error
```

`Session` is neither a variable nor a valid S3 session handle:

```
domain_error(s3_session,Session)
```

`Session` is a valid S3 session handle but not open:

```
existence_error(s3_session,Session)
```

`Bucket` is a variable:

```
instantiation_error
```

`Bucket` is neither a variable nor an atom:

```
type_error(atom,Bucket)
```

`Bucket` is an atom but not a valid S3 bucket:

```
domain_error(s3_bucket,Bucket)
```

The delegated S3 client request failed:

```
domain_error(s3_http_status,Status)
```

Remarks:

- Options: Per-call options accept the same terms as `open/2` and are merged before the stored session defaults, so explicit call options take precedence.

`list_objects_v2/5`

Lists objects using session defaults merged with per-call options.

Compilation flags:

`static`

Template:

`list_objects_v2(Session,Bucket,Request,Listing,Options)`

Mode and number of proofs:

`list_objects_v2(+compound,+atom,+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Request` is a variable:

`instantiation_error`

An element `Option` of the request option list is a variable:

`instantiation_error`

An element `Option` of the request option list is neither a variable nor a compound term:

`type_error(compound,Option)`

`Request` is not a valid ListObjectsV2 request term or option list:

`domain_error(s3_list_objects_request,Request)`

An element `Option` of the request option list is a compound term but not a valid ListObjectsV2 request option:

`domain_error(s3_list_objects_request_option,Option)`

The delegated S3 client request failed:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` and are merged before the stored session defaults, so explicit call options take precedence. The `Request` argument carries the ListObjectsV2-specific request terms.

---

head_object/5

Returns object metadata using session defaults merged with per-call options.

Compilation flags:
`static`

Template:
`head_object(Session,Bucket,Key,Metadata,Options)`
Mode and number of proofs:
`head_object(+compound,+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Session` is a variable:
`instantiation_error`
`Session` is neither a variable nor a valid S3 session handle:
`domain_error(s3_session,Session)`
`Session` is a valid S3 session handle but not open:
`existence_error(s3_session,Session)`
`Bucket` is a variable:
`instantiation_error`
`Bucket` is neither a variable nor an atom:
`type_error(atom,Bucket)`
`Bucket` is an atom but not a valid S3 bucket:
`domain_error(s3_bucket,Bucket)`
`Key` is a variable:
`instantiation_error`
`Key` is neither a variable nor an atom:
`type_error(atom,Key)`
The delegated S3 client request failed:
`domain_error(s3_http_status,Status)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` and are merged before the stored session defaults, so explicit call options take precedence.

---

presigned_get_object/5

Generates a presigned download URL using session defaults merged with per-call options.

Compilation flags:
`static`

Template:
`presigned_get_object(Session,Bucket,Key,URL,Options)`
Mode and number of proofs:
`presigned_get_object(+compound,+atom,+atom,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

The delegated S3 client request failed:

`domain_error(s3_client_option,Option)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` plus `expires(Seconds)` for the URL lifetime and `payload_hash(Hash)` when `payload_hash_mode(signed)` is selected. Presigned URLs default to `payload_hash_mode(unsigned)`. Options are merged before the stored session defaults, so explicit call options take precedence.

`presigned_put_object/5`

Generates a presigned upload URL using session defaults merged with per-call options.

Compilation flags:

`static`

Template:

`presigned_put_object(Session,Bucket,Key,URL,Options)`

Mode and number of proofs:

`presigned_put_object(+compound,+atom,+atom,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

The delegated S3 client request failed:

`domain_error(s3_client_option,Option)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` plus `expires(Seconds)` for the URL lifetime and `payload_hash(Hash)` when `payload_hash_mode(signed)` is selected. Presigned URLs default to `payload_hash_mode(unsigned)`. Options are merged before the stored session defaults, so explicit call options take precedence.

`presigned_post_object/5`

Generates a presigned POST URL using session defaults merged with per-call options.

Compilation flags:

`static`

Template:

`presigned_post_object(Session,Bucket,Key,URL,Options)`

Mode and number of proofs:

`presigned_post_object(+compound,+atom,+atom,-atom,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

The delegated S3 client request failed:

`domain_error(s3_client_option,Option)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` plus `expires(Seconds)` for the URL lifetime and `payload_hash(Hash)` when `payload_hash_mode(signed)` is selected. Presigned URLs default to `payload_hash_mode(unsigned)`. Options are merged before the stored session defaults, so explicit call options take precedence.

`put_object/7`

Uploads a local file path using session defaults merged with per-call options and returns the object ETag and response metadata as separate arguments.

Compilation flags:

`static`

Template:

`put_object(Session,Bucket,Key,File,ETag,Properties,Options)`

Mode and number of proofs:

`put_object(+compound,+atom,+atom,+atom,-atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

`File` is a variable:

`instantiation_error`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

`File` exists but is not a readable file:

`domain_error(file([],[read]),File)`

The file `File` does not exist:

`existence_error(file,File)`

The delegated S3 client request failed:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` and are merged before the stored session defaults, so explicit call options take precedence.

`delete_object/5`

Deletes an object using session defaults merged with per-call options, returning `delete_result(Properties)`.

Compilation flags:

`static`

Template:

`delete_object(Session,Bucket,Key,Result,Options)`

Mode and number of proofs:

`delete_object(+compound,+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

The delegated S3 client request failed:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` and are merged before the stored session defaults, so explicit call options take precedence.

---

copy_object/6

Copies an object using session defaults merged with per-call options, returning `copy_result(ETag, Properties)`.

Compilation flags:

`static`

Template:

`copy_object(Session,Source,Bucket,Key,Result,Options)`

Mode and number of proofs:

`copy_object(+compound,+compound,+atom,+atom,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Session` is a variable:

`instantiation_error`

`Session` is neither a variable nor a valid S3 session handle:

`domain_error(s3_session,Session)`

`Session` is a valid S3 session handle but not open:

`existence_error(s3_session,Session)`

`Bucket` is a variable:

`instantiation_error`

`Source` is a variable:

`instantiation_error`

The version identifier in `Source` is a variable:

`instantiation_error`

`Source` is neither a variable nor a compound term:

`type_error(compound,Source)`

`Bucket` is neither a variable nor an atom:

`type_error(atom,Bucket)`

The version identifier in `Source` is neither a variable nor an atom:

`type_error(atom,VersionId)`

`Source` is a compound term but not a valid copy source term:

`domain_error(s3_copy_source,Source)`

`Bucket` is an atom but not a valid S3 bucket:

`domain_error(s3_bucket,Bucket)`

The version identifier in `Source` is an atom but not a valid version identifier:

`domain_error(s3_version_id,VersionId)`

`Key` is a variable:

`instantiation_error`

`Key` is neither a variable nor an atom:

`type_error(atom,Key)`

The delegated S3 client request failed:

`domain_error(s3_http_status,Status)`

Remarks:

- Options: Per-call options accept the same terms as `open/2` and are merged before the stored session defaults, so explicit call options take precedence.

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

session_seed_/1

Dynamic counter used to generate fresh session identifiers.

Compilation flags:
`dynamic`

Template:
`session_seed_(SessionId)`
Mode and number of proofs:
`session_seed_(?positive_integer)` - `zero_or_one`

---

session_state_/2

Dynamic mapping between session identifiers and their stored default option lists.

Compilation flags:
`dynamic`

Template:
`session_state_(SessionId,Options)`
Mode and number of proofs:
`session_state_(?positive_integer,?list(compound))` - `zero_or_more`

Operators

(none)
object

1.288.7 s3_signing

AWS Signature Version 4 helpers specialized for S3.

Availability:
`logtalk_load(s3(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-07-09

Compilation flags:

`static, context_switching_calls`

Imports:
`public` *options*
Uses:
date
hmac
http_core
list
os
sha256
term_io
user

Remarks:
(none)

Inherited public predicates:
check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *payload_hash/2*
  - *canonical_query/2*
  - *canonical_request/6*
  - *sign_request/8*
  - *presigned_query_pairs/7*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

payload_hash/2

Returns the hexadecimal SHA-256 payload hash for a normalized HTTP body term.

Compilation flags:
`static`

Template:
`payload_hash(Body,Hash)`
Mode and number of proofs:
`payload_hash(+compound,-atom)` - `one_or_error`

Exceptions:
`Body` is not a valid normalized HTTP body term:
`domain_error(http_body,Body)`

No registered HTTP body codec exists for the body media type when codec-based encoding is required:
`existence_error(http_body_codec,MediaType)`

---

canonical_query/2

Returns the canonical AWS SigV4 query string for the given name-value pairs.

Compilation flags:
`static`

Template:
`canonical_query(Pairs,Query)`

Mode and number of proofs:
`canonical_query(+list(pair),-atom)` - `one_or_error`

Exceptions:
`Pairs` is not a valid list of canonical query pairs:
`domain_error(s3_query_pairs,Pairs)`

---

canonical_request/6

Builds the canonical request string for the given method, URI, query pairs, signed headers, and payload hash.

Compilation flags:
`static`

Template:
`canonical_request(Method,CanonicalURI,QueryPairs,Headers,PayloadHash,CanonicalRequest)`

Mode and number of proofs:
`canonical_request(+atom,+atom,+list(pair),+list(compound),+atom,-atom)` - `one_or_error`

Exceptions:
`Method` is not a supported HTTP method for this helper:
`domain_error(s3_method,Method)`
`QueryPairs` is not a valid list of canonical query pairs:
`domain_error(s3_query_pairs,QueryPairs)`

---

sign_request/8

Signs an S3 request and returns the final normalized header list.

Compilation flags:

`static`

Template:

`sign_request(Method,HostHeader,CanonicalURI,QueryPairs,Body,Headers,SignedHeaders,Options)`

Mode and number of proofs:

`sign_request(+atom,+atom,+atom,+list(pair),+compound,+list(compound),-list(compound),+list(compound))` - `one_or_error`

Exceptions:

`Options` is missing valid credentials:

`domain_error(s3_credentials,missing)`

`Body` is not a valid normalized HTTP body term:

`domain_error(http_body,Body)`

`Headers` contains a managed or invalid signed header:

`domain_error(s3_managed_header,Header)`

The signing timestamp is invalid:

`domain_error(s3_amz_date,AmzDate)`

Remarks:

- Option `credentials/1`: Required access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional session token for temporary credentials.
- Option `region/1`: AWS region for the credential scope. Defaults to `us-east-1`.
- Option `payload_hash_mode/1`: Payload signing mode, either `signed` or `unsigned`. Defaults to `signed`.
- Option `request_time/1`: Optional explicit local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: UTC offset used to derive the signing time from the local clock. Defaults to `0`.
- Option `amz_date/1`: Optional explicit AWS SigV4 timestamp overriding any derived request time.

---

presigned_query_pairs/7

Signs an S3 request for query-string authentication and returns the final canonical query pairs, including the signature.

Compilation flags:

`static`

Template:

`presigned_query_pairs(Method,HostHeader,CanonicalURI,QueryPairs,Headers,SignedQueryPairs,Options)`

Mode and number of proofs:

`presigned_query_pairs(+atom,+atom,+atom,+list(pair),+list(compound),-list(pair),+list(compound))` - `one_or_error`

Exceptions:

`Options` is missing valid credentials:

`domain_error(s3_credentials,missing)`

`Headers` contains a managed or invalid signed header:

`domain_error(s3_managed_header,Header)`

The signing timestamp is invalid:

`domain_error(s3_amz_date,AmzDate)`

The expiration is invalid or outside the AWS SigV4 range:

`domain_error(s3_presign_expires,Expires)`

The payload hash is missing, invalid, or incompatible with unsigned mode:

`domain_error(s3_presign_payload_hash,Hash)`

Remarks:

- Option `credentials/1`: Required access credentials as `credentials(access_key_id(AccessKeyId), secret_access_key(SecretAccessKey))`.
- Option `session_token/1`: Optional session token for temporary credentials. It is emitted as the `X-Amz-Security-Token` query parameter.
- Option `region/1`: AWS region for the credential scope. Defaults to `us-east-1`.
- Option `payload_hash_mode/1`: Presigned URLs default to `unsigned` payload hashing and use `UNSIGNED-PAYLOAD`. Use `signed` together with `payload_hash/1` to sign a precomputed payload hash.
- Option `payload_hash/1`: Precomputed hexadecimal SHA-256 payload hash required when `payload_hash_mode(signed)` is selected.
- Option `request_time/1`: Optional explicit local request time as `date_time(Year, Month, Day, Hours, Minutes, Seconds)`.
- Option `utc_offset_seconds/1`: UTC offset used to derive the signing time from the local clock. Defaults to `0`.
- Option `amz_date/1`: Optional explicit AWS SigV4 timestamp overriding any derived request time.
- Option `expires/1`: Presigned URL lifetime in seconds. Defaults to `900` and must not exceed `604800`.

object

1.288.8 s3_xml

Adapter layer mapping S3 XML responses to stable library terms.

Availability:
`logtalk_load(s3(loader))`

Author: Paulo Moura
Version: 1:0:1
Date: 2026-08-02

Compilation flags:
`static, context_switching_calls`

Uses:
list
user
xml

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *list_buckets_response/2*
  - *list_objects_v2_response/2*
  - *copy_object_response/2*
  - *create_multipart_upload_response/2*
  - *error_response/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

list_buckets_response/2

Parses a ListBuckets XML response body.

Compilation flags:
`static`

Template:
`list_buckets_response(Body,Buckets)`
Mode and number of proofs:
`list_buckets_response(+compound,-compound)` - `one_or_error`

Exceptions:

`Body` is not a supported XML response body term:

`domain_error(s3_xml_body,Body)`

The XML document is malformed or missing required elements:

`domain_error(s3_xml_document,Codes)`

`list_objects_v2_response/2`

Parses a ListObjectsV2 XML response body.

Compilation flags:

`static`

Template:

`list_objects_v2_response(Body,Listing)`

Mode and number of proofs:

`list_objects_v2_response(+compound,-compound)` - `one_or_error`

Exceptions:

`Body` is not a supported XML response body term:

`domain_error(s3_xml_body,Body)`

The XML document is malformed or missing required elements:

`domain_error(s3_xml_document,Codes)`

`copy_object_response/2`

Parses a CopyObject XML response body.

Compilation flags:

`static`

Template:

`copy_object_response(Body,Result)`

Mode and number of proofs:

`copy_object_response(+compound,-compound)` - `one_or_error`

Exceptions:

`Body` is not a supported XML response body term:

`domain_error(s3_xml_body,Body)`

The XML document is malformed or missing required elements:

`domain_error(s3_xml_document,Codes)`

---

create_multipart_upload_response/2

Parses a CreateMultipartUpload XML response body.

Compilation flags:

`static`

Template:

`create_multipart_upload_response(Body,Result)`

Mode and number of proofs:

`create_multipart_upload_response(+compound,-compound)` - `one_or_error`

Exceptions:

`Body` is not a supported XML response body term:

`domain_error(s3_xml_body,Body)`

The XML document is malformed or missing required elements:

`domain_error(s3_xml_document,Codes)`

---

error_response/2

Parses an S3 XML error response body.

Compilation flags:

`static`

Template:

`error_response(Body,Error)`

Mode and number of proofs:

`error_response(+compound,-compound)` - `zero_or_one_or_error`

Exceptions:

`Body` is not a supported XML response body term:

`domain_error(s3_xml_body,Body)`

The XML document is malformed or missing required elements:

`domain_error(s3_xml_document,Codes)`

Public predicates

term/2

Returns a SARIF 2.1.0 report term for the given list of diagnostics tool specifications. Each specification must be a `tool_spec(Tool, Target, Options)` term.

Compilation flags:
`static`

Template:
`term(Specs,Term)`
Mode and number of proofs:
`term(+list(compound),-compound)` - `one`

---

term/4

Returns a SARIF 2.1.0 report term for a diagnostics tool target using the given options.

Compilation flags:
`static`

Template:
`term(Tool,Target,Term,Options)`
Mode and number of proofs:
`term(+object_identifier,+nonvar,-compound,+list(compound))` - `one`

---

generate/2

Generates a SARIF 2.1.0 report for the given list of diagnostics tool specifications and sink accepted by the json library. Each specification must be a `tool_spec(Tool, Target, Options)` term.

Compilation flags:
`static`

Template:
`generate(Specs,Sink)`

Mode and number of proofs:
`generate(+list(compound),++compound)` - `one`

`generate/4`

Generates a SARIF 2.1.0 report for a diagnostics tool target using the given options and sink accepted by the json library.

Compilation flags:
`static`

Template:
`generate(Tool,Target,Sink,Options)`
Mode and number of proofs:
`generate(+object_identifier,+nonvar,++compound,+list(compound))` - `one`

list
type

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *decode/8*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

decode/8

Decodes captured stdout and process metadata into a collected `sat_result(Status, Model, Properties)` term, mapping reported literals back through an optional `Variables` table.

Compilation flags:
`static`

Template:
`decode(Solver,Codes,RawStatus,NormalizedStatus,Diagnostics,SourceMap,Variables,Result)`
Mode and number of proofs:

`decode(+atom,+list(code),+term,+compound,+list(code),+list(compound),+term,-compound)` - `one_or_error`

Exceptions:

`Solver` is not a ground term:
`instantiation_error`
`Solver` is neither a variable nor an atom:
`type_error(atom,Solver)`
`Codes` is a partial list or a list with an element `Element` which is a variable:
`instantiation_error`
`Codes` is neither a partial list nor a list of character codes:
`type_error(codes,Codes)`
`Codes` has no status line or an unsupported status label:
`domain_error(sat_output,Field-Value)`
The witness line is missing its zero terminator:
`domain_error(sat_output,witness_terminator_missing)`
A witness literal number has no entry in the variable table:
`domain_error(sat_output,variable(Number))`
`RawStatus` is not a ground term:
`instantiation_error`
`NormalizedStatus` is not a ground term:
`instantiation_error`
`NormalizedStatus` is fatal or inconsistent with the decoded solver result:
`domain_error(sat_process_status,NormalizedStatus)`
`Diagnostics` is a partial list or a list with an element `Element` which is a variable:
`instantiation_error`
`Diagnostics` is neither a partial list nor a list of character codes:
`type_error(codes,Diagnostics)`
`SourceMap` is a partial list or a list with an element `Element` which is a variable:
`instantiation_error`
`SourceMap` is neither a variable nor a list:
`type_error(list,SourceMap)`
`Variables` is not a ground term:
`instantiation_error`
`Variables` is ground but neither `none` nor a list of pairs:
`type_error(list(pair),Variables)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *cnf_statement/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

`cnf_statement/2`

Enumerates, by backtracking, canonical CNF statements in source order and their origins.

Compilation flags:
`static`

Template:
`cnf_statement(Statement,Origin)`
Mode and number of proofs:
`cnf_statement(-compound,-term)` - `zero_or_more`

Remarks:

- Origin: Either `source(File, Start, End)` or `unknown`.

Protected predicates

(none)

Private predicates

(none)

Operators

(none)
object

1.290.5 `sat_process`

Isolated operating-system shell transport for the Kissat, CaDiCaL, Glucose, and Z3 CLIs.

Availability:
`logtalk_load(sat(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-11

(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *quote/3*
  - *run/7*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

quote/3

Quotes an atom as one POSIX shell or Windows PowerShell literal, without interpolation.

Compilation flags:
`static`

Template:
`quote(Platform,Argument,Quoted)`
Mode and number of proofs:
`quote(+atom,+atom,-atom)` - `one_or_error`

Exceptions:
`Platform` is a variable:
`instantiation_error`
`Platform` is neither a variable nor an atom:
`type_error(atom,Platform)`
`Platform` is an atom but neither `posix` nor `windows`:
`domain_error(sat_shell_platform,Platform)`
`Argument` is a variable:
`instantiation_error`
`Argument` is neither a variable nor an atom:
`type_error(atom,Argument)`
`Argument` is an atom but contains a null character:
`domain_error(sat_shell_argument,Argument)`

run/7

Runs the CLI using an owned directory and separate UTF-8 output files, returning only after cleanup.

Compilation flags:

`static`

Template:

`run(Executable,Arguments,Source,Codes,Diagnostics,RawStatus,NormalizedStatus)`

Mode and number of proofs:

`run(+atom,+list(atom),+compound,-list(code),-list(code),-term,-compound)` - `one_or_error`

Exceptions:

`Executable` is a variable:

`instantiation_error`

`Executable` is neither a variable nor an atom:

`type_error(atom,Executable)`

`Arguments` is a partial list or a list with an element `Argument` which is a variable:

`instantiation_error`

`Arguments` is neither a variable nor a list:

`type_error(list(atom),Arguments)`

An element `Argument` of the list `Arguments` is neither a variable nor an atom:

`type_error(atom,Argument)`

`Executable` or an element `Argument` of the list `Arguments` contains a null character:

`domain_error(sat_shell_argument,Argument)`

`Source` is not a ground term:

`instantiation_error`

`Source` is neither `file(Path)` nor `codes(Codes)`:

`domain_error(sat_process_source,Source)`

A launcher dependency does not exist:

`existence_error(command,Command)`

A source or capture file does not exist:

`existence_error(source_sink,Path)`

A source or capture file cannot be opened:

`permission_error(open,source_sink,Path)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

`sat_transport(Stage,Status,Details)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

object

1.290.6 `sat_program`

Canonical CNF statement validation, DIMACS source generation, and variable table computation.

Availability:
`logtalk_load(sat(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-10

Compilation flags:
`static, context_switching_calls`

Uses:
list
type

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *serialize/2*
  - *serialize/4*
  - *variables/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

serialize/2

Serializes ground canonical CNF statements to DIMACS character codes, assigning sequential variable numbers by first occurrence.

Compilation flags:
`static`

Template:
`serialize(Statements,Codes)`
Mode and number of proofs:
`serialize(+list,-list(code))` - `one_or_error`

Exceptions:
`Statements` is a partial list or a list with an element `Statement` which is a variable:
`instantiation_error`
`Statements` is neither a partial list nor a list:
`type_error(list,Statements)`
An element `Statement` of the list `Statements` is not a valid statement:
`domain_error(sat_statement,Statement)`

---

serialize/4

Serializes statements with origins and returns `line(Start, End, Origin)` source-map entries; the generated header occupies line 1.

Compilation flags:
`static`

Template:
`serialize(Statements,Origins,Codes,SourceMap)`
Mode and number of proofs:
`serialize(+list,+list,-list(code),-list(compound))` - `one_or_error`

Exceptions:
`Statements` is a partial list or a list with an element `Statement` which is a variable:
`instantiation_error`
`Statements` is neither a partial list nor a list:
`type_error(list,Statements)`
An element `Statement` of the list `Statements` is not a valid statement:
`domain_error(sat_statement,Statement)`
`Origins` is a partial list or a list with an element `Origin` which is a variable:
`instantiation_error`
`Origins` is neither a variable nor a list:
`type_error(list,Origins)`
`Origins` has an element that is neither `unknown` nor a valid `source(File, Start, End)` term, or its length differs from `Statements`:

`domain_error(sat_origins,Origins)`

`variables/2`

Returns the ordered `Term-Number` variable table that `serialize/2` and `serialize/4` assign by first occurrence across clause statements.

Compilation flags:
`static`

Template:
`variables(Statements,Variables)`
Mode and number of proofs:
`variables(+list,-list(pair))` - `one_or_error`

Exceptions:
`Statements` is a partial list or a list with an element `Statement` which is a variable:
`instantiation_error`
`Statements` is neither a partial list nor a list:
`type_error(list,Statements)`
An element `Statement` of the list `Statements` is not a valid statement:
`domain_error(sat_statement,Statement)`

Public predicates

solve/2

Solves a source with default options using the external SAT solver CLI and returns a collected result after cleanup. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`.

Compilation flags:
`static`

Template:
`solve(Source,Result)`

Mode and number of proofs:
`solve(+compound,-compound)` - `one_or_error`

Exceptions:
`Source` is not a ground term:
`instantiation_error`
`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `sat_problem_protocol`:
`domain_error(sat_source,Source)`
`Statements` is ground but not a list:

`type_error(list,Statements)`
A statement enumerated by the provider object is not a valid statement:
`domain_error(sat_statement,Statement)`
An origin enumerated by the provider object is invalid, or its origins and statements differ in length:
`domain_error(sat_origins,Origins)`
`Codes` is ground but not a list of character codes:
`type_error(codes,Codes)`
An element `Code` of the list `Codes` is ground but not an integer:
`type_error(integer,Code)`
An element `Code` of the list `Codes` is an integer but not a valid character code:
`domain_error(character_code,Code)`
`Path` is ground but not an atom:
`type_error(atom,Path)`
`Path` does not exist:
`existence_error(source_sink,Path)`
`Path` cannot be opened for reading:
`permission_error(open,source_sink,Path)`
A launcher argument contains a null character:
`domain_error(sat_shell_argument,Argument)`
The selected solver executable or a shell dependency does not exist:
`existence_error(command,Command)`
An owned directory cannot be found during cleanup:
`existence_error(directory,Directory)`
An owned file or directory cannot be removed:
`permission_error(delete,source_sink,Path)`
A character sequence is not valid UTF-8:
`representation_error(utf_8)`
A launcher operation fails:
`sat_transport(Stage,Status,Details)`
Solver output is invalid or inconsistent with its exit status:
`sat_solver_error(Formal,Status,Diagnostics,SourceMap)`

`solve/3`

Solves a source using `solver/1`, `executable/1`, `time_limit/1`, `conflicts/1`, `decisions/1`, `seed/1`, and `witness/1` options. Repeated options use the first occurrence. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`.

Compilation flags:
`static`

Template:
`solve(Source,Result,Options)`
Mode and number of proofs:
`solve(+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Source` is not a ground term:
    `instantiation_error`
`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `sat_problem_protocol`:
    `domain_error(sat_source,Source)`
`Statements` is ground but not a list:
    `type_error(list,Statements)`
A statement enumerated by the provider object is not a valid statement:
    `domain_error(sat_statement,Statement)`
An origin enumerated by the provider object is invalid, or its origins and statements differ in length:
    `domain_error(sat_origins,Origins)`
`Codes` is ground but not a list of character codes:
    `type_error(codes,Codes)`
An element `Code` of the list `Codes` is ground but not an integer:
    `type_error(integer,Code)`
An element `Code` of the list `Codes` is an integer but not a valid character code:
    `domain_error(character_code,Code)`
`Path` is ground but not an atom:
    `type_error(atom,Path)`
`Path` does not exist:
    `existence_error(source_sink,Path)`
`Path` cannot be opened for reading:
    `permission_error(open,source_sink,Path)`
`Options` is a variable:
    `instantiation_error`
`Options` is neither a variable nor a list:
    `type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
    `instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
    `type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
    `domain_error(option,Option)`
A launcher argument contains a null character:
    `domain_error(sat_shell_argument,Argument)`
The selected solver executable or a shell dependency does not exist:
    `existence_error(command,Command)`
An owned directory cannot be found during cleanup:
    `existence_error(directory,Directory)`
An owned file or directory cannot be removed:
    `permission_error(delete,source_sink,Path)`
A character sequence is not valid UTF-8:
    `representation_error(utf_8)`
A launcher operation fails:
    `sat_transport(Stage,Status,Details)`
Solver output is invalid or inconsistent with its exit status:
    `sat_solver_error(Formal,Status,Diagnostics,SourceMap)`

program/1

Generates and prints DIMACS CNF source to the current output using default options, equivalent to `program/2` followed by `print_program/1`, without invoking the solver.

Compilation flags:

`static`

Template:

`program(Source)`

Mode and number of proofs:

`program(+compound)` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `sat_problem_protocol`:

`domain_error(sat_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(sat_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(sat_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

program/2

Returns DIMACS CNF source codes from `object(Object)`, `terms(Statements)`, `codes(Codes)`, or `file(Path)` using default options, without invoking the solver.

Compilation flags:

`static`

Template:

`program(Source,Codes)`

Mode and number of proofs:

`program(+compound,-list(integer))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `sat_problem_protocol`:

`domain_error(sat_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(sat_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(sat_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

---

program/3

Returns DIMACS CNF source codes from `object(Object)`, `terms(Statements)`, `codes(Codes)`, or `file(Path)`, using the `embed_variables/1` option, without invoking the solver.

Compilation flags:

`static`

Template:

`program(Source,Codes,Options)`

Mode and number of proofs:

`program(+compound,-list(integer),+list(compound))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `sat_problem_protocol`:

`domain_error(sat_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(sat_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(sat_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

print_program/1

Prints DIMACS CNF character codes to the current output without adding a newline or invoking the solver.

Compilation flags:

`static`

Template:

`print_program(Codes)`

Mode and number of proofs:

`print_program(+list(integer))` - `one_or_error`

Exceptions:

`Codes` is not a ground term:

`instantiation_error`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

---

literal/2

Enumerates, by backtracking, the collected model literals (`+Term` or `-Term`) without starting a process. Fails when the result has no witness.

Compilation flags:

`static`

Template:

`literal(Result,Literal)`

Mode and number of proofs:

`literal(+compound,-compound)` - `zero_or_more`

Exceptions:

`Result` is not a ground term:

`instantiation_error`

`Result` is not a valid collected SAT solver result:

`domain_error(sat_result,Result)`

---

result_property/2

Enumerates, by backtracking, `status(Status)` and the stored result properties.

Compilation flags:

`static`

Template:

`result_property(Result,Property)`

Mode and number of proofs:

`result_property(+compound,?compound)` - `zero_or_more`

Exceptions:

`Result` is not a ground term:

`instantiation_error`

`Result` is not a valid collected SAT solver result:

`domain_error(sat_result,Result)`

---

print_result/1

Prints the collected status and, when present, the witness literals to the current output using Kissat-style `s`/`v` labels, without invoking the solver.

Compilation flags:

`static`

Template:

`print_result(Result)`

Mode and number of proofs:

`print_result(+compound)` - `one_or_error`

Exceptions:

`Result` is not a ground term:

`instantiation_error`

`Result` is not a valid collected SAT solver result:

`domain_error(sat_result,Result)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

Public predicates

document/2

Returns an SPDX 2.3 or a CycloneDX 1.7 JSON term describing the currently loaded application using the given options. The JSON term represents objects using curly terms, pairs using a dash, and strings using atoms.

Compilation flags:

```
static
```

Template:

```
document(Document,Options)
```

Mode and number of proofs:

```
document(-compound,+list(compound)) - one
```

---

document/1

Returns an SPDX 2.3 JSON term describing the currently loaded application using default options. The JSON term represents objects using curly terms, pairs using a dash, and strings using atoms.

Compilation flags:

```
static
```

Template:

```
document(Document)
```

Mode and number of proofs:

```
document(-compound) - one
```

---

export/2

Exports an SPDX 2.3 or a CycloneDX 1.7 JSON document describing the currently loaded application to the specified sink using the given options. Valid sinks are `codes(List)`, `stream(Stream)`, `file(Path)`, `chars(List)`, and `atom(Atom)`.

Compilation flags:

`static`

Template:

`export(Sink,Options)`

Mode and number of proofs:

`export(++compound,+list(compound))` - `one`

---

export/1

Exports an SPDX 2.3 JSON document describing the currently loaded application to the specified sink using default options. Valid sinks are `codes(List)`, `stream(Stream)`, `file(Path)`, `chars(List)`, and `atom(Atom)`.

Compilation flags:

`static`

Template:

`export(Sink)`

Mode and number of proofs:

`export(++compound)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

spdx_license_schema_/1

Caches the parsed schema used to validate SPDX license identifiers for CycloneDX exports.

Compilation flags:

`dynamic`

Template:

`spdx_license_schema_(Schema)`

Mode and number of proofs:

`spdx_license_schema_(-term)` - `zero_or_one`

Operators

(none)

1.292 schulze_ranker

object

1.292.1 `schulze_ranker`

Schulze pairwise preference ranker. Learns one deterministic score per item from a dataset object implementing the `pairwise_ranking_dataset_protocol` protocol by computing strongest paths over aggregated head-to-head outcomes and returns a self-describing ranker term with diagnostics that can be used for ranking and export.

Availability:
`logtalk_load(schulze_ranker(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-05-07

Compilation flags:

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

check_sequences/4

Validates the collected dataset sequences and returns the maximum total sequence length.

Compilation flags:

```
static
```

Template:

```
check_sequences(Dataset,ItemDomain,Sequences,MaxSequenceLength)
```

Mode and number of proofs:

```
check_sequences(+object_identifier,+list(atom),+list(pair(integer,
list(list(atom)))),-integer) - one
```

---

pattern_length/2

Computes the total number of items in a sequential pattern.

Compilation flags:

```
static
```

Template:

```
pattern_length(Pattern,PatternLength)
```

Mode and number of proofs:

```
pattern_length(+list(list(atom)),-integer) - one
```

---

sort_patterns/2

Sorts sequence patterns first by total item count and then lexicographically.

Compilation flags:

```
static
```

Template:

```
sort_patterns(Patterns0,Patterns)
```

Mode and number of proofs:

```
sort_patterns(+list(compound),-list(compound)) - one
```

---

filter_patterns/3

Filters sequence patterns by minimum total item count.

Compilation flags:

```
static
```

Template:

```
filter_patterns(Patterns0,MinimumPatternLength,Patterns)
```

Mode and number of proofs:

```
filter_patterns(+list(compound),+integer,-list(compound)) - one
```

---

count_items/4

Accumulates support counts for a list of items.

Compilation flags:

```
static
```

Template:

```
count_items(Items,Count,ItemCounts0,ItemCounts)
```

Mode and number of proofs:

```
count_items(+list(atom),+integer,+list(pair(atom,integer)),-list(pair(atom,
integer))) - one
```

---

select_frequent_item_supports/3

Selects the item supports that satisfy the minimum support count.

Compilation flags:
```
static
```

Template:
```
select_frequent_item_supports(ItemCounts,SupportCount,FrequentItemSupports)
```
Mode and number of proofs:
```
select_frequent_item_supports(+list(pair(atom,integer)),+integer,-list(compound))
- one
```

---

sort_item_supports/2

Sorts item supports lexicographically by item.

Compilation flags:
```
static
```

Template:
```
sort_item_supports(ItemSupports0,ItemSupports)
```
Mode and number of proofs:
```
sort_item_supports(+list(compound),-list(compound)) - one
```

---

valid_sequence_patterns/2

True when the patterns are valid `sequence_pattern(Pattern, Support)` terms over the given item domain with positive integer supports.

Compilation flags:
```
static
```

Template:
```
valid_sequence_patterns(ItemDomain,Patterns)
```
Mode and number of proofs:
```
valid_sequence_patterns(+list(atom),+list(compound)) - zero_or_one
```

Public predicates

as_set/2

Returns a set with all unique elements from the given list.

Compilation flags:
```
static
```

Template:
```
as_set(List,Set)
```
Mode and number of proofs:
```
as_set(@list,-set) - one
```

---

as_list/2

Returns a list with all elements of the given set.

Compilation flags:
```
static
```

Template:
```
as_list(Set,List)
```
Mode and number of proofs:
```
as_list(@set,-list) - one
```

---

delete/3

Deletes an element from a set returning the set of the remaining elements.

Compilation flags:
`static`

Template:
`delete(Set,Element,Remaining)`
Mode and number of proofs:
`delete(@set,@term,-set)` - `one`

---

disjoint/2

True when the two sets have no element in common.

Compilation flags:
`static`

Template:
`disjoint(Set1,Set2)`
Mode and number of proofs:
`disjoint(@set,@set)` - `zero_or_one`

---

equal/2

True when the two sets are equal.

Compilation flags:
`static`

Template:
`equal(Set1,Set2)`
Mode and number of proofs:
`equal(@set,@set)` - `zero_or_one`

---

empty/1

True when the set is empty.

Compilation flags:
```
static
```

Template:
```
empty(Set)
```
Mode and number of proofs:
```
empty(@set) - zero_or_one
```

---

insert/3

Inserts an element in a set, returning the resulting set.

Compilation flags:
```
static
```

Template:
```
insert(In,Element,Out)
```
Mode and number of proofs:
```
insert(@set,@term,-set) - one
```

---

insert_all/3

Inserts all the elements of the list into a set, returning the resulting set.

Compilation flags:
```
static
```

Template:
```
insert_all(List,In,Out)
```
Mode and number of proofs:
```
insert_all(@list,@set,-set) - one
```

---

intersect/2

True if the two sets have at least one element in common.

Compilation flags:
`static`

Template:
`intersect(Set1,Set2)`
Mode and number of proofs:
`intersect(@set,@set)` - `zero_or_one`

---

intersection/3

Computes the intersection of `Set1` and `Set2`.

Compilation flags:
`static`

Template:
`intersection(Set1,Set2,Intersection)`
Mode and number of proofs:
`intersection(@set,@set,-set)` - `one`

---

intersection/4

Computes the intersection and the difference between `Set2` and `Set1`.

Compilation flags:
`static`

Template:
`intersection(Set1,Set2,Intersection,Difference)`
Mode and number of proofs:
`intersection(@set,@set,-set,-set)` - `one`

---

size/2

Number of set elements.

Compilation flags:
`static`

Template:
`size(Set,Size)`
Mode and number of proofs:
`size(@set,?integer)` - `zero_or_one`

---

member/2

`Element` is a member of set `Set`.

Compilation flags:
`static`

Template:
`member(Element,Set)`
Mode and number of proofs:
`member(?term,+set)` - `zero_or_more`

---

memberchk/2

True when a term is a member of a set.

Compilation flags:
`static`

Template:
`memberchk(Element,Set)`
Mode and number of proofs:
`memberchk(@term,@set)` - `zero_or_one`

---

powerset/2

Returns the power set of a set, represented as a list of sets.

Compilation flags:
```
static
```

Template:
```
powerset(Set,Powerset)
```
Mode and number of proofs:
```
powerset(@set,-list(set)) - one
```

---

product/3

Returns the cartesian product of two sets.

Compilation flags:
```
static
```

Template:
```
product(Set1,Set2,Product)
```
Mode and number of proofs:
```
product(@set,@set,-set) - one
```

---

select/3

Selects an element from a set, returning the set of remaining elements.

Compilation flags:
```
static
```

Template:
```
select(Element,Set,Remaining)
```
Mode and number of proofs:
```
select(?term,?set,?set) - zero_or_more
```

---

selectchk/3

True if an element can be selected from a set, returning the set of remaining elements.

Compilation flags:
`static`

Template:
`selectchk(Element,Set,Remaining)`
Mode and number of proofs:
`selectchk(@term,@set,-set)` - `zero_or_one`

---

subset/2

True if `Subset` is a subset of `Set`.

Compilation flags:
`static`

Template:
`subset(Subset,Set)`
Mode and number of proofs:
`subset(@set,@set)` - `zero_or_one`

---

subtract/3

Computes the set of all the elements of `Set1` which are not also in `Set2`.

Compilation flags:
`static`

Template:
`subtract(Set1,Set2,Difference)`
Mode and number of proofs:
`subtract(@set,@set,-set)` - `one`

---

symdiff/3

Computes the symmetric difference of `Set1` and `Set2`, containing all elements that are not in the sets intersection.

Compilation flags:
`static`

Template:
`symdiff(Set1,Set2,Difference)`
Mode and number of proofs:
`symdiff(@set,@set,-set)` - `one`

---

union/3

Computes the union of `Set1` and `Set2`.

Compilation flags:
`static`

Template:
`union(Set1,Set2,Union)`
Mode and number of proofs:
`union(@set,@set,-set)` - `one`

---

union/4

Computes the union of `Set1` and `Set2` and the difference between `Set2` and `Set1`.

Compilation flags:
`static`

Template:
`union(Set1,Set2,Union,Difference)`
Mode and number of proofs:
`union(@set,@set,-set,-set)` - `one`

interval, *interval_constraint_network*

protocol

1.296.2 `stn_protocol`

Portable, functional Simple Temporal Networks over closed difference constraints.

Availability:
`logtalk_load(simple_temporal_networks(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-01

Compilation flags:
`static`

Dependencies:
(none)

Remarks:

- Constraints: A constraint from `X` to `Y` with weight `Delta` means `time(Y) - time(X) =< Delta`.
- Inputs: States must be opaque ground terms returned by this API. Malformed public arguments and unknown time-points fail without instantiating inputs; hand-built internal states are unsupported.
- Numbers: Weights are finite integers or floats. Arithmetic errors propagate; floating-point results are approximate, with no implicit tolerance.
- Bounds: Unbounded query results use the atoms positive_infinity and negative_infinity, never native numeric infinities.

Inherited public predicates:
(none)

Public predicates

new/2

Creates an unconstrained network over distinct ground time-points and a reserved reference time-point zero fixed at time zero. Fails for duplicate labels or an explicitly supplied zero.

Compilation flags:

```
static
```

Template:

```
new(TimePoints,STN)
```

Mode and number of proofs:

```
new(+list,-stn) - zero_or_one
```

---

add_time_points/3

Appends distinct fresh ground time-points, rebuilding once and preserving source identifiers. Fails for existing labels or zero. An empty list returns the original state.

Compilation flags:

```
static
```

Template:

```
add_time_points(STN0,TimePoints,STN)
```

Mode and number of proofs:

```
add_time_points(+stn,+list,-stn) - zero_or_one_or_error
```

Exceptions:

Arithmetic cannot be evaluated:

```
evaluation_error(A)
```

Arithmetic exceeds a backend representation limit:

```
representation_error(A)
```

---

remove_time_points/3

Removes time-points and all incident source constraints, rebuilding once and preserving surviving node order and source identifiers. Missing labels and duplicate requests are ignored. Fails for a request containing zero or a malformed or nonground list.

Compilation flags:

```
static
```

Template:

```
remove_time_points(STN0,TimePoints,STN)
```

Mode and number of proofs:

```
remove_time_points(+stn,+list,-stn) - zero_or_one_or_error
```

Exceptions:

Arithmetic cannot be evaluated:

```
evaluation_error(A)
```

Arithmetic exceeds a backend representation limit:

```
representation_error(A)
```

Remarks:

- Bounds: Deletion retracts incident sources, not just variables. Bounds supported through removed points may weaken or become unbounded; implied bounds are not preserved as new constraints.
- Identity: Labels are compared by term identity. The original state and next source identifier are preserved. A request removing no existing point returns the original state.

---

time_points/2

Returns the declared time-points in insertion order, with zero first.

Compilation flags:
`static`

Template:
`time_points(STN,TimePoints)`
Mode and number of proofs:
`time_points(+stn,-list)` - `zero_or_one`

---

constraints/2

Returns all source constraints in insertion order as `constraint(Id, X, Y, Delta)` terms, including redundant and parallel constraints.

Compilation flags:
`static`

Template:
`constraints(STN,Constraints)`
Mode and number of proofs:
`constraints(+stn,-list(compound))` - `zero_or_one`

---

consistent/1

True if the argument is a library-owned consistent state. All successfully returned states are consistent; this predicate is not an importer for hand-built internal terms.

Compilation flags:
`static`

Template:
`consistent(STN)`
Mode and number of proofs:
`consistent(+stn)` - `zero_or_one`

---

schedule/2

Returns one finite feasible assignment as time(Point, Value) terms in declaration order, with time(zero, 0) first. Fails for invalid states without instantiating inputs.

Compilation flags:

```
static
```

Template:

```
schedule(STN,Schedule)
```

Mode and number of proofs:

```
schedule(+stn,-list(compound)) - zero_or_one_or_error
```

Exceptions:

Arithmetic cannot be evaluated:

```
evaluation_error(A)
```

Arithmetic exceeds a backend representation limit:

```
representation_error(A)
```

Remarks:

- Choice: The assignment is deterministic, not necessarily unique, earliest, non-negative, or optimal. Disconnected and absolutely unbounded points are assigned finite values.
- Numbers: Every retained source inequality is checked after normalization using backend arithmetic. Floating-point results remain approximate, with no implicit tolerance.

---

earliest_schedule/2

Returns the componentwise earliest feasible assignment as time(Point, Value) terms in declaration order, with time(zero, 0) first. Requires every declared point to have a finite absolute lower bound. Fails for invalid states or any unbounded lower bound without instantiating inputs.

Compilation flags:

```
static
```

Template:

```
earliest_schedule(STN,Schedule)
```

Mode and number of proofs:

```
earliest_schedule(+stn,-list(compound)) - zero_or_one_or_error
```

Exceptions:

Arithmetic cannot be evaluated:

```
evaluation_error(A)
```

Arithmetic exceeds a backend representation limit:

```
representation_error(A)
```

Remarks:

- Bounds: Finite upper bounds are not required. No artificial lower bounds are introduced and the original state and source identifiers are unchanged.

- Numbers: Componentwise minimality holds in exact arithmetic. Every retained source inequality is checked using backend arithmetic; floating-point feasibility and optimality are not exact-real guarantees and no tolerance is applied.

---

add_constraint/5

Adds `Y - X =< Delta`, retaining the source even when redundant. Fails if the result is inconsistent or the inputs are invalid.

Compilation flags:

```
static
```

Template:

```
add_constraint(STN0,X,Y,Delta,STN)
```

Mode and number of proofs:

```
add_constraint(+stn,@term,@term,+number,-stn) - zero_or_one_or_error
```

Exceptions:

Arithmetic cannot be evaluated:

```
evaluation_error(A)
```

Arithmetic exceeds a backend representation limit:

```
representation_error(A)
```

---

add_constraint/6

Adds `Y - X =< Delta` and returns its source identifier. Fails for an inconsistent result or invalid inputs. Identifiers are local to a state lineage, not globally unique across forks.

Compilation flags:

```
static
```

Template:

```
add_constraint(STN0,X,Y,Delta,Id,STN)
```

Mode and number of proofs:

```
add_constraint(+stn,@term,@term,+number,-integer,-stn) - zero_or_one_or_error
```

Exceptions:

Arithmetic cannot be evaluated:

```
evaluation_error(A)
```

Arithmetic exceeds a backend representation limit:

```
representation_error(A)
```

---

add_constraints/3

Atomically adds a batch of `constraint(X, Y, Delta)` terms, rebuilding once. Fails if any input is invalid or the combined network is inconsistent. An empty batch returns the original state.

Compilation flags:

`static`

Template:

`add_constraints(STN0,Constraints,STN)`

Mode and number of proofs:

`add_constraints(+stn,+list(compound),-stn)` - `zero_or_one_or_error`

Exceptions:

Arithmetic cannot be evaluated:

`evaluation_error(A)`

Arithmetic exceeds a backend representation limit:

`representation_error(A)`

---

add_constraints/4

Atomically adds `constraint(X, Y, Delta)` terms and returns their source identifiers in batch order. Fails for invalid inputs or an inconsistent result.

Compilation flags:

`static`

Template:

`add_constraints(STN0,Constraints,Ids,STN)`

Mode and number of proofs:

`add_constraints(+stn,+list(compound),-list(integer),-stn)` - `zero_or_one_or_error`

Exceptions:

Arithmetic cannot be evaluated:

`evaluation_error(A)`

Arithmetic exceeds a backend representation limit:

`representation_error(A)`

---

try_add_constraints/4

Attempts a batch update and returns `consistent(STN)` or `inconsistent(cycle(Sources, Weight))`. The cycle is an ordered closed path of identified source constraints with negative total weight, not necessarily a minimal conflict. Invalid inputs fail.

Compilation flags:

`static`

Template:

`try_add_constraints(STN0,Constraints,Ids,Outcome)`

Mode and number of proofs:

`try_add_constraints(+stn,+list(compound),-list(integer),-compound)` - `zero_or_one_or_error`

Exceptions:

Arithmetic cannot be evaluated:

`evaluation_error(A)`

Arithmetic exceeds a backend representation limit:

`representation_error(A)`

Remarks:

- Identifiers: Ids identifies candidate constraints in batch order even when rejected. No state is changed; rejected identifiers may coincide with later accepted allocations from the original state.
- Arithmetic: Backend arithmetic errors propagate. Non-finite computed sums raise evaluation_error(float_overflow); inconsistent numerical diagnostics raise evaluation_error(stn_numerical_inconsistency).

---

remove_constraints/3

Removes source constraints by positive integer identifier, rebuilding once if necessary. Missing identifiers and duplicate requests are ignored. Surviving identifiers are preserved and removed identifiers are never reused in descendant states.

Compilation flags:

`static`

Template:

`remove_constraints(STN0,Ids,STN)`

Mode and number of proofs:

`remove_constraints(+stn,+list(integer),-stn)` - `zero_or_one_or_error`

Exceptions:

Arithmetic cannot be evaluated:

`evaluation_error(A)`

Arithmetic exceeds a backend representation limit:

`representation_error(A)`

---

distance/4

Returns the tightest upper bound on `Y - X`, or positive_infinity if no directed path exists.

Compilation flags:

```
static
```

Template:

```
distance(STN,X,Y,Upper)
```

Mode and number of proofs:

```
distance(+stn,@term,@term,-bound) - zero_or_one
```

---

distance/5

Returns a finite tight upper bound on `Y - X` and one ordered supporting source-constraint path. Fails for an unreachable pair. An identity query returns zero and an empty path. Ties select one deterministic witness, not every support.

Compilation flags:

```
static
```

Template:

```
distance(STN,X,Y,Upper,Path)
```

Mode and number of proofs:

```
distance(+stn,@term,@term,-number,-list(compound)) - zero_or_one_or_error
```

Exceptions:

A numerical witness cannot be reconstructed:

```
evaluation_error(stn_numerical_inconsistency)
```

---

entails/4

True if the network entails `Y - X =< Delta` for a finite integer or float Delta.

Compilation flags:

```
static
```

Template:

```
entails(STN,X,Y,Delta)
```

Mode and number of proofs:

```
entails(+stn,@term,@term,+number) - zero_or_one
```

---

entails/5

True if the network entails `Y - X =< Delta` and returns one supporting source-constraint path.

Compilation flags:
`static`

Template:
`entails(STN,X,Y,Delta,Path)`
Mode and number of proofs:
`entails(+stn,@term,@term,+number,-list(compound))` - `zero_or_one`

Exceptions:
A numerical witness cannot be reconstructed:
`evaluation_error(stn_numerical_inconsistency)`

---

earliest/3

Returns the earliest feasible time relative to zero, or negative_infinity when unbounded.

Compilation flags:
`static`

Template:
`earliest(STN,TimePoint,Earliest)`
Mode and number of proofs:
`earliest(+stn,@term,-bound)` - `zero_or_one`

---

latest/3

Returns the latest feasible time relative to zero, or positive_infinity when unbounded.

Compilation flags:
`static`

Template:
`latest(STN,TimePoint,Latest)`
Mode and number of proofs:
`latest(+stn,@term,-bound)` - `zero_or_one`

---

bounds/4

Returns the tightest absolute time window, including symbolic unbounded endpoints. The reference point zero has bounds `[0, 0]`.

Compilation flags:

```
static
```

Template:

```
bounds(STN,TimePoint,Earliest,Latest)
```

Mode and number of proofs:

```
bounds(+stn,@term,-bound,-bound) - zero_or_one
```

---

difference_bounds/5

Returns tight bounds `Lower =< Y - X =< Upper`. `Lower` is the negated reverse distance, `Upper` the forward distance. Either endpoint may be symbolically unbounded.

Compilation flags:

```
static
```

Template:

```
difference_bounds(STN,X,Y,Lower,Upper)
```

Mode and number of proofs:

```
difference_bounds(+stn,@term,@term,-bound,-bound) - zero_or_one
```

---

can_precede/3

True if some feasible schedule has `X` strictly earlier than `Y`. Tests whether the upper bound on `Y - X` is positive or unbounded.

Compilation flags:

```
static
```

Template:

```
can_precede(STN,X,Y)
```

Mode and number of proofs:

```
can_precede(+stn,@term,@term) - zero_or_one
```

---

must_precede/3

True if every feasible schedule has `X` strictly earlier than `Y`. Tests whether the lower bound on `Y - X` is positive.

Compilation flags:
`static`

Template:
`must_precede(STN,X,Y)`
Mode and number of proofs:
`must_precede(+stn,@term,@term)` - `zero_or_one`

---

can_precede_or_equal/3

True if some feasible schedule has `X` no later than `Y`. Tests whether the upper bound on `Y - X` is non-negative or unbounded.

Compilation flags:
`static`

Template:
`can_precede_or_equal(STN,X,Y)`
Mode and number of proofs:
`can_precede_or_equal(+stn,@term,@term)` - `zero_or_one`

---

must_precede_or_equal/3

True if every feasible schedule has `X` no later than `Y`. Tests whether the lower bound on `Y - X` is non-negative.

Compilation flags:
`static`

Template:
`must_precede_or_equal(STN,X,Y)`
Mode and number of proofs:
`must_precede_or_equal(+stn,@term,@term)` - `zero_or_one`

---

window_interval/3

Returns a finite non-degenerate marginal time-point window as i(Start, End), preserving endpoint numeric representations. Fails for unknown points, invalid states, and unbounded or singleton windows.

Compilation flags:

```
static
```

Template:

```
window_interval(STN,TimePoint,Interval)
```

Mode and number of proofs:

```
window_interval(+stn,@term,-compound) - zero_or_one
```

Remarks:

- Numeric ordering: The descriptor uses arithmetic endpoint ordering, not term ordering. It is numeric data, not a portable replacement for the ranked interval bridge.
- Envelope: Describes marginal absolute bounds, not an event duration or joint endpoint correlations.

---

event_interval/4

Returns a concrete event interval as i(Start, End), preserving endpoint numeric representations. Both points must have finite singleton absolute bounds and the duration must be strictly positive. Fails for invalid states and unknown, uncertain, unbounded, reversed, or zero-duration endpoints.

Compilation flags:

```
static
```

Template:

```
event_interval(STN,StartPoint,EndPoint,Interval)
```

Mode and number of proofs:

```
event_interval(+stn,@term,@term,-compound) - zero_or_one
```

Remarks:

- Numeric ordering: The descriptor uses arithmetic endpoint ordering, not term ordering. Use event_relation/6 for the portable ranked Allen-relation bridge.

---

window_relation/4

Classifies two finite, non-degenerate marginal time-point windows using Allen relations. Fails for unbounded or singleton windows. This is an envelope diagnostic, not an entailed relation between uncertain events.

Compilation flags:

```
static
```

Template:

```
window_relation(STN,TimePoint1,TimePoint2,Relation)
```

Mode and number of proofs:

`window_relation(+stn,@term,@term,-atom)` - `zero_or_one`

Remarks:

- Numeric ordering: Delegates to interval after jointly ranking endpoints by arithmetic value, preserving numeric equality across integers and floats.

`event_relation/6`

Classifies two concrete event intervals using Allen relations. All four endpoint time-points must have finite singleton absolute bounds and each event must have strictly positive duration. Fails for uncertain, unbounded, reversed, or zero-duration events.

Compilation flags:

`static`

Template:

`event_relation(STN,Start1,End1,Start2,End2,Relation)`

Mode and number of proofs:

`event_relation(+stn,@term,@term,@term,@term,-atom)` - `zero_or_one`

Remarks:

- Numeric ordering: Delegates to interval after jointly ranking endpoints by arithmetic value, without converting integer endpoints to floats.

simulated_annealing(Problem,Random), *simulated_annealing_protocol*

object

1.297.2 simulated_annealing(Problem,Random)

- `Problem` - Problem object implementing `simulated_annealing_protocol`.
- `Random` - Random number generator object providing `between/3`, `random/1`, and `randomize/1` predicates.

Simulated annealing optimization algorithm. Parameterized by a problem object implementing the `simulated_annealing_protocol` protocol and by a random number generator algorithm for the `fast_random` library. The algorithm minimizes the energy (cost) function defined by the problem. Custom cooling schedules, stop conditions, delta-energy neighbor generation, progress reporting, and reheating restarts can be defined by the problem object or configured via options; suitable defaults are used otherwise.

Availability:
`logtalk_load(simulated_annealing(loader))`

Author: Paulo Moura
Version: 2:0:0
Date: 2026-11-19

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *options*
Uses:
type

Remarks:

- Algorithm: Simulated annealing is a probabilistic metaheuristic for global optimization. It explores the solution space by iteratively generating neighbor states and accepting them based on an energy-dependent probability that decreases over time as the temperature cools.
- Acceptance criterion: Uses the standard Boltzmann acceptance criterion: a worse neighbor is accepted with probability `exp(-DeltaE / Temperature)`.
- Default cooling schedule: Geometric cooling: `NewTemp is Temp * 0.995`. Override by defining `cooling_schedule/3` in the problem object.
- Default stop condition: The search stops when the maximum number of steps is reached or the temperature drops below the minimum temperature. Override by defining `stop_condition/3` in the problem object.
- Delta-energy optimization: If the problem object defines `neighbor_state/3`, the algorithm uses the returned delta energy directly instead of calling `state_energy/2` on the neighbor. This is useful when computing the energy change is cheaper than recomputing the full energy.
- Progress reporting: If the problem object defines `progress/5`, it is called periodically with the current step, temperature, best energy, acceptance rate, and improvement rate. The reporting interval is controlled by the `updates(N)` option. A final report is always produced when the loop terminates.

- Best state tracking: The algorithm tracks the best state found across all iterations and across all restart cycles, not just the final state.
- Seed control: The `seed(S)` option initializes the random number generator for reproducible runs.
- Reheating restart: The `restarts(N)` option runs N additional SA cycles after the first. Each restart reheats the temperature to the initial value and begins from the best state found so far, allowing the search to escape local minima. Statistics accumulate across all cycles.
- Auto-temperature estimation: The `estimate_temperature/1-2` predicates sample random neighbor transitions and compute an initial temperature that would produce a target acceptance rate. This avoids manual tuning of the initial temperature.

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *estimate_temperature/1*
  - *estimate_temperature/2*
  - *run/2*
  - *run/3*
  - *run/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

estimate_temperature/1

Estimates an initial temperature for the problem using default options (200 samples, 80% target acceptance rate).

Compilation flags:

`static`

Template:

`estimate_temperature(Temperature)`

Mode and number of proofs:

`estimate_temperature(-float)` - `one`

---

estimate_temperature/2

Estimates an initial temperature by sampling random neighbor transitions. The temperature is computed so that the Boltzmann acceptance probability for the average uphill move equals the target acceptance rate. Sampling starts from the problem initial state and follows a random walk.

Compilation flags:

`static`

Template:

```
estimate_temperature(Temperature,Options)
```

Mode and number of proofs:

```
estimate_temperature(-float,+list(compound)) - one
```

Remarks:

- `samples(N)` option: Number of random neighbor transitions to sample (default: `200`).
- `acceptance_rate(P)` option: Target initial acceptance rate as an integer percentage between 1 and 99 (default: `80`).

---

run/2

Runs the simulated annealing algorithm using default options and returns the best state found and its energy.

Compilation flags:

```
static
```

Template:

```
run(BestState,BestEnergy)
```

Mode and number of proofs:

```
run(-term,-number) - one
```

---

run/3

Runs the simulated annealing algorithm using the given options and returns the best state found and its energy.

Compilation flags:

```
static
```

Template:

```
run(BestState,BestEnergy,Options)
```

Mode and number of proofs:

```
run(-term,-number,+list(compound)) - one
```

Remarks:

- `max_steps(N)` option: Maximum number of iterations per cycle (default: `10000`).
- `min_temperature(T)` option: Minimum temperature floor; search stops when temperature drops below this value (default: `0.001`).
- `updates(N)` option: Number of progress reports during the run. Set to `0` to disable. Progress is reported by calling `progress/5` on the problem object (default: `0`).
- `seed(S)` option: Positive integer seed for the random number generator, enabling reproducible runs (default: none).
- `restarts(N)` option: Number of additional SA cycles after the first. Each restart reheats the temperature and begins from the best state found so far (default: `0`).

`run/4`

Runs the simulated annealing algorithm using the given options, returns the best state found and its energy, and returns run statistics.

Compilation flags:
`static`

Template:
`run(BestState,BestEnergy,Statistics,Options)`
Mode and number of proofs:
`run(-term,-number,-list(compound),+list(compound))` - `one`

Remarks:

- Statistics list: A list of `Key(Value)` pairs: `steps(N)` is the number of steps executed, `acceptances(A)` is the number of accepted moves, `improvements(I)` is the number of moves that improved the best energy, and `final_temperature(T)` is the temperature at termination.

simulated_annealing(Problem), *simulated_annealing_protocol*

protocol

1.297.3 `simulated_annealing_protocol`

Protocol for simulated annealing problem definitions. A problem object must define the four required predicates and may optionally define predicates to override cooling, stopping, neighbor generation with delta energy, and progress reporting defaults.

Availability:
`logtalk_load(simulated_annealing(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-02-22

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *initial_state/1*
  - *neighbor_state/2*
  - *neighbor_state/3*
  - *state_energy/2*
  - *initial_temperature/1*
  - *cooling_schedule/3*
  - *stop_condition/3*
  - *progress/5*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

initial_state/1

Returns an initial state for the optimization problem.

Compilation flags:
`static`

Template:
`initial_state(State)`

Mode and number of proofs:
`initial_state(-term)` - `one`

---

neighbor_state/2

Generates a neighboring state from the given state. This is the most problem-specific predicate and its definition determines the quality of the search.

Compilation flags:
`static`

Template:

```
neighbor_state(State,Neighbor)
```

Mode and number of proofs:

```
neighbor_state(+term,-term) - one
```

---

neighbor_state/3

Generates a neighboring state and returns the energy change (delta) directly, avoiding a full energy recomputation. Optional. When not defined by the problem, the algorithm calls `neighbor_state/2` and `state_energy/2` instead.

Compilation flags:

```
static
```

Template:

```
neighbor_state(State,Neighbor,DeltaEnergy)
```

Mode and number of proofs:

```
neighbor_state(+term,-term,-number) - one
```

---

state_energy/2

Computes the energy (cost) of the given state. The algorithm minimizes this value.

Compilation flags:

```
static
```

Template:

```
state_energy(State,Energy)
```

Mode and number of proofs:

```
state_energy(+term,-number) - one
```

---

initial_temperature/1

Returns the initial temperature for the annealing schedule. Higher temperatures increase the probability of accepting worse solutions early on.

Compilation flags:

```
static
```

Template:

```
initial_temperature(Temperature)
```

Mode and number of proofs:

```
initial_temperature(-number) - one
```

---

cooling_schedule/3

Computes the next temperature from the current temperature and step number. Optional. When not defined by the problem, a default geometric cooling schedule is used (`NewTemp is Temp * 0.995`).

Compilation flags:

```
static
```

Template:

```
cooling_schedule(Temperature,Step,NewTemperature)
```

Mode and number of proofs:

```
cooling_schedule(+number,+non_negative_integer,-number) - one
```

---

stop_condition/3

True when the search should stop given the current step, temperature, and best energy found so far. Optional. When not defined by the problem, the search runs until the maximum number of steps is reached or the minimum temperature is reached.

Compilation flags:

```
static
```

Template:

```
stop_condition(Step,Temperature,BestEnergy)
```

Mode and number of proofs:

```
stop_condition(+non_negative_integer,+number,+number) - zero_or_one
```

---

progress/5

Called periodically to report optimization progress. Optional. When not defined by the problem, progress reporting is skipped. The acceptance and improvement rates are values between 0.0 and 1.0 computed over the interval since the last progress report.

Compilation flags:

```
static
```

Template:

```
progress(Step,Temperature,BestEnergy,AcceptanceRate,ImprovementRate)
```

Mode and number of proofs:

```
progress(+non_negative_integer,+number,+number,+number,+number) - zero_or_one
```

Inherited public predicates:

(none)

- *Public predicates*
  - `decode/7`
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

`decode/7`

Decodes captured stdout and process metadata into a list of collected `smt_result(Status, Model, Properties)` terms, one per check response, including objective responses when present.

Compilation flags:

`static`

Template:

`decode(Solver,Codes,RawStatus,NormalizedStatus,Diagnostics,SourceMap,Results)`

Mode and number of proofs:

`decode(+atom,+list(code),+term,+compound,+list(code),+list(compound),-list(compound))` - `one_or_error`

Exceptions:

`Solver` is not a ground term:

`instantiation_error`

`Solver` is neither a variable nor an atom:

`type_error(atom,Solver)`

`Codes` is a partial list or a list with an element `Element` which is a variable:

`instantiation_error`

`Codes` is neither a partial list nor a list of character codes:

`type_error(codes,Codes)`

`Codes` contains an unrecognized character or an unbalanced parenthesis:

`domain_error(smt_output,Field-Value)`

A model, unsat core, or get-value response appears before any status response:

`domain_error(smt_output,Response-unexpected)`

The solver reported an `(error ...)` response:

`smt_solver_reported_error(Message)`

The solver reported an unsupported command:

`smt_solver_reported_error(unsupported)`

`RawStatus` is not a ground term:

`instantiation_error`

`NormalizedStatus` is not a ground term:

`instantiation_error`

`NormalizedStatus` is neither a variable nor one of `exit(Code)`, `unknown(Details)`, nor `killed(Details)`:

`domain_error(smt_process_status,NormalizedStatus)`

No response was parsed and the process did not exit cleanly:

`domain_error(smt_process_status,NormalizedStatus)`

`Diagnostics` is a partial list or a list with an element `Element` which is a variable:

`instantiation_error`

`Diagnostics` is neither a partial list nor a list of character codes:

`type_error(codes,Diagnostics)`

`SourceMap` is a partial list or a list with an element `Element` which is a variable:

`instantiation_error`

`SourceMap` is neither a variable nor a list:

`type_error(list,SourceMap)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

protocol

1.299.4 `smt_problem_protocol`

Protocol for ordered, ground SMT-LIB 2 statement providers.

Availability:

`logtalk_load(smt(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-08

Compilation flags:

Inherited public predicates:
(none)

- *Public predicates*
  - *quote/3*
  - *run/7*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

quote/3

Quotes an atom as one POSIX shell or Windows PowerShell literal, without interpolation.

Compilation flags:
`static`

Template:
`quote(Platform,Argument,Quoted)`
Mode and number of proofs:

`quote(+atom,+atom,-atom)` - `one_or_error`

Exceptions:

`Platform` is a variable:
`instantiation_error`
`Platform` is neither a variable nor an atom:
`type_error(atom,Platform)`
`Platform` is an atom but neither `posix` nor `windows`:
`domain_error(smt_shell_platform,Platform)`
`Argument` is a variable:
`instantiation_error`
`Argument` is neither a variable nor an atom:
`type_error(atom,Argument)`
`Argument` is an atom but contains a null character:
`domain_error(smt_shell_argument,Argument)`

---

run/7

Runs the CLI using an owned directory and separate UTF-8 output files, returning only after cleanup.

Compilation flags:

`static`

Template:

`run(Executable,Arguments,Source,Codes,Diagnostics,RawStatus,NormalizedStatus)`

Mode and number of proofs:

`run(+atom,+list(atom),+compound,-list(code),-list(code),-term,-compound)` - `one_or_error`

Exceptions:

`Executable` is a variable:
`instantiation_error`
`Executable` is neither a variable nor an atom:
`type_error(atom,Executable)`
`Arguments` is a partial list or a list with an element `Argument` which is a variable:
`instantiation_error`
`Arguments` is neither a variable nor a list:
`type_error(list(atom),Arguments)`
An element `Argument` of the list `Arguments` is neither a variable nor an atom:
`type_error(atom,Argument)`
`Executable` or an element `Argument` of the list `Arguments` contains a null character:
`domain_error(smt_shell_argument,Argument)`
`Source` is not a ground term:
`instantiation_error`
`Source` is neither `file(Path)` nor `codes(Codes)`:
`domain_error(smt_process_source,Source)`
A launcher dependency does not exist:

```
existence_error(command,Command)
```
A source or capture file does not exist:
```
existence_error(source_sink,Path)
```
A source or capture file cannot be opened:
```
permission_error(open,source_sink,Path)
```
An owned directory cannot be found during cleanup:
```
existence_error(directory,Directory)
```
An owned file or directory cannot be removed:
```
permission_error(delete,source_sink,Path)
```
A character sequence is not valid UTF-8:
```
representation_error(utf_8)
```
A launcher operation fails:
```
smt_transport(Stage,Status,Details)
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)
object

1.299.6 `smt_program`

Canonical SMT-LIB 2 statement validation, source generation, and response-producing statement classification.

Availability:
```
logtalk_load(smt(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-11-14

Compilation flags:
```
static, context_switching_calls
```

Uses:
list
type

Remarks:
(none)

Inherited public predicates:

(none)

- *Public predicates*
  - *serialize/2*
  - *serialize/4*
  - *response_producing/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

serialize/2

Serializes ground canonical SMT-LIB 2 statements to character codes, auto-declaring `:produce-models` and `:produce-unsat-cores` options when required and not already set by the caller.

Compilation flags:
`static`

Template:
`serialize(Statements,Codes)`

Mode and number of proofs:
`serialize(+list,-list(code))` - `one_or_error`

Exceptions:
`Statements` is a partial list or a list with an element `Statement` which is a variable:
`instantiation_error`
`Statements` is neither a partial list nor a list:
`type_error(list,Statements)`
An element `Statement` of the list `Statements` is not a valid statement:
`domain_error(smt_statement,Statement)`

---

serialize/4

Serializes statements with origins and returns `line(Start, End, Origin)` source-map entries; auto-declared option statements use the `unknown` origin.

Compilation flags:
`static`

Template:
`serialize(Statements,Origins,Codes,SourceMap)`

Mode and number of proofs:
`serialize(+list,+list,-list(code),-list(compound))` - `one_or_error`

Exceptions:

`Statements` is a partial list or a list with an element `Statement` which is a variable:

```
instantiation_error
```

`Statements` is neither a partial list nor a list:

```
type_error(list,Statements)
```

An element `Statement` of the list `Statements` is not a valid statement:

```
domain_error(smt_statement,Statement)
```

`Origins` is a partial list or a list with an element `Origin` which is a variable:

```
instantiation_error
```

`Origins` is neither a partial list nor a list:

```
type_error(list,Origins)
```

An element of the list `Origins` is neither `unknown` nor a valid `source(File, Start, End)` term, or its length differs from `Statements`:

```
domain_error(smt_origins,Origins)
```

`response_producing/1`

Succeeds when `Statement` is a response-producing command, including `get-objectives`.

Compilation flags:

```
static
```

Template:

```
response_producing(Statement)
```

Mode and number of proofs:

`response_producing(+compound)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

protocol

1.299.7 smt_protocol

Protocol for process-backed Z3, cvc5, Bitwuzla, and Yices 2 CLI solving, SMT-LIB 2 source generation, and collected result inspection.

- *Private predicates*
- *Operators*

Public predicates

solve/2

Solves a source with default options using the external SMT solver CLI and returns a collected result per `check-sat` command, in script order, after cleanup. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`.

Compilation flags:

`static`

Template:

`solve(Source,Results)`

Mode and number of proofs:

`solve(+compound,-list(compound))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `smt_problem_protocol`:

`domain_error(smt_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(smt_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(smt_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

A launcher argument contains a null character:

`domain_error(smt_shell_argument,Argument)`

The selected solver executable or a shell dependency does not exist:

`existence_error(command,Command)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

`smt_transport(Stage,Status,Details)`

Solver output is invalid or inconsistent with its exit status:

`smt_solver_error(Formal,Status,Diagnostics,SourceMap)`

`solve/3`

Solves a source using `solver/1`, `executable/1`, and `time_limit/1` options. Repeated options use the first occurrence. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`.

Compilation flags:

`static`

Template:

`solve(Source,Results,Options)`

Mode and number of proofs:

`solve(+compound,-list(compound),+list(compound))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `smt_problem_protocol`:

`domain_error(smt_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(smt_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(smt_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

A launcher argument contains a null character:

```
domain_error(smt_shell_argument,Argument)
```

The selected solver executable or a shell dependency does not exist:

```
existence_error(command,Command)
```

An owned directory cannot be found during cleanup:

```
existence_error(directory,Directory)
```

An owned file or directory cannot be removed:

```
permission_error(delete,source_sink,Path)
```

A character sequence is not valid UTF-8:

```
representation_error(utf_8)
```

A launcher operation fails:

```
smt_transport(Stage,Status,Details)
```

Solver output is invalid or inconsistent with its exit status:

```
smt_solver_error(Formal,Status,Diagnostics,SourceMap)
```

`program/1`

Generates and prints SMT-LIB 2 source to the current output, equivalent to `program/2` followed by `print_program/1`, without invoking the solver.

Compilation flags:

```
static
```

Template:

```
program(Source)
```

Mode and number of proofs:

```
program(+compound) - one_or_error
```

Exceptions:

`Source` is not a ground term:

```
instantiation_error
```

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `smt_problem_protocol`:

```
domain_error(smt_source,Source)
```

`Statements` is ground but not a list:

```
type_error(list,Statements)
```

A statement enumerated by the provider object is not a valid statement:

```
domain_error(smt_statement,Statement)
```

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

```
domain_error(smt_origins,Origins)
```

`Codes` is ground but not a list of character codes:

```
type_error(codes,Codes)
```

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

`program/2`

Returns SMT-LIB 2 source codes from `object(Object)`, `terms(Statements)`, `codes(Codes)`, or `file(Path)` without invoking the solver.

Compilation flags:

`static`

Template:

`program(Source,Codes)`

Mode and number of proofs:

`program(+compound,-list(integer))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `smt_problem_protocol`:

`domain_error(smt_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(smt_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(smt_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:
`permission_error(open,source_sink,Path)`

`print_program/1`

Prints SMT-LIB 2 character codes to the current output without adding a newline or invoking the solver.

Compilation flags:
`static`

Template:
`print_program(Codes)`
Mode and number of proofs:
`print_program(+list(integer))` - `one_or_error`

Exceptions:
`Codes` is not a ground term:
`instantiation_error`
`Codes` is ground but not a list of character codes:
`type_error(codes,Codes)`
An element `Code` of the list `Codes` is ground but not an integer:
`type_error(integer,Code)`
An element `Code` of the list `Codes` is an integer but not a valid character code:
`domain_error(character_code,Code)`
The current output stream does not allow writing:
`permission_error(output,stream,Stream)`

`status/2`

Returns the collected status (`satisfiable`, `unsatisfiable`, or `unknown`) of a single `check-sat` result.

Compilation flags:
`static`

Template:
`status(Result,Status)`
Mode and number of proofs:
`status(+compound,-atom)` - `one_or_error`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected SMT solver result:
`domain_error(smt_result,Result)`

---

model_binding/2

Enumerates, by backtracking, the collected model bindings (`Symbol-Value` pairs) without starting a process. Fails when the result has no model.

Compilation flags:

```
static
```

Template:

```
model_binding(Result,Binding)
```

Mode and number of proofs:

```
model_binding(+compound,-pair) - zero_or_more
```

Exceptions:

`Result` is not a ground term:

```
instantiation_error
```

`Result` is not a valid collected SMT solver result:

```
domain_error(smt_result,Result)
```

---

model_value/3

Looks up the collected model value bound to `Symbol`. Fails when the result has no model or no binding for `Symbol`.

Compilation flags:

```
static
```

Template:

```
model_value(Result,Symbol,Value)
```

Mode and number of proofs:

```
model_value(+compound,+atom,-term) - zero_or_one
```

Exceptions:

`Result` or `Symbol` is a variable:

```
instantiation_error
```

`Symbol` is neither a variable nor an atom:

```
type_error(atom,Symbol)
```

`Result` is not a valid collected SMT solver result:

```
domain_error(smt_result,Result)
```

---

unsat_core_name/2

Enumerates, by backtracking, the named assertions in the collected unsatisfiable core without starting a process. Fails when the result has no core.

Compilation flags:
`static`

Template:
`unsat_core_name(Result,Name)`
Mode and number of proofs:
`unsat_core_name(+compound,-atom)` - `zero_or_more`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected SMT solver result:
`domain_error(smt_result,Result)`

---

result_property/2

Enumerates, by backtracking, `status(Status)` and the stored result properties.

Compilation flags:
`static`

Template:
`result_property(Result,Property)`
Mode and number of proofs:
`result_property(+compound,?compound)` - `zero_or_more`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected SMT solver result:
`domain_error(smt_result,Result)`

---

print_result/1

Prints a single collected result (status and, when present, model bindings and unsat core names) to the current output, without invoking the solver.

Compilation flags:
`static`

Template:

```
print_result(Result)
```

Mode and number of proofs:

```
print_result(+compound) - one_or_error
```

Exceptions:

`Result` is not a ground term:

```
instantiation_error
```

`Result` is not a valid collected SMT solver result:

```
domain_error(smt_result,Result)
```

The current output stream does not allow writing:

```
permission_error(output,stream,Stream)
```

---

print_results/1

Prints each collected result in `Results`, in order, separating consecutive results with a blank line.

Compilation flags:

```
static
```

Template:

```
print_results(Results)
```

Mode and number of proofs:

```
print_results(+list(compound)) - one_or_error
```

Exceptions:

`Results` is not a ground term:

```
instantiation_error
```

`Results` is ground but not a list:

```
type_error(list,Results)
```

An element of the list `Results` is not a valid collected SMT solver result:

```
domain_error(smt_result,Result)
```

The current output stream does not allow writing:

```
permission_error(output,stream,Stream)
```

---

capability/2

Enumerates, by backtracking, advisory `Solver`-`Feature` capability pairs. Purely informational: the library does not enforce these pairs and a solver call may still succeed, fail, or report `unknown` for a feature outside this table.

Compilation flags:

```
static
```

Template:

```
capability(Solver,Feature)
```

Mode and number of proofs:

`capability(?atom,?atom)` - `zero_or_more`

Remarks:

- Feature: One of `quantifiers`, `strings`, `linear_arithmetic`, `non_linear_arithmetic`, `unsat_cores`, `incremental`, `bit_vectors`, `arrays`, `floating_point`, or `algebraic_datatypes`.

  - *streams/3*
  - *failure_details/3*
  - *close/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

open/8

Opens an implicit TLS or STARTTLS SMTP connection using OpenSSL.

Compilation flags:
`static`

Template:
`open(Host,Port,Security,Helo,Executable,ServerName,Options,Connection)`
Mode and number of proofs:
`open(+atom,+integer,+atom,+atom,+atom,+atom,+list,--compound)` - `one_or_error`

---

streams/3

Returns the input and output streams for an open process connection.

Compilation flags:
`static`

Template:
`streams(Connection,Input,Output)`
Mode and number of proofs:
`streams(+compound,--stream,--stream)` - `one_or_error`

Exceptions:

Either `Input` or `Output` streams do not exist:
`domain_error(smtp_process_connection,Connection)`

`failure_details/3`

Returns the process exit status and standard error output after an OpenSSL connection failure.

Compilation flags:
`static`

Template:
`failure_details(Connection,Status,Diagnostic)`
Mode and number of proofs:
`failure_details(+compound,--term,--atom)` - `one`

`close/1`

Closes the streams and terminates the OpenSSL process.

Compilation flags:
`static`

Template:
`close(Connection)`
Mode and number of proofs:
`close(+compound)` - `one`

Protected predicates

Public predicates

send/5

Opens an SMTP session, sends a message, and closes the session. Unicode `Subject` and `Comments` header values are serialized as RFC 2047 UTF-8 Base64 encoded words; all other header values must be ASCII.

Compilation flags:
`static`

Template:
`send(Host,Port,Message,Result,Options)`
Mode and number of proofs:
`send(+atom,+integer,+compound,--compound,+list)` - `one_or_error`

Exceptions:

`Host` or `Port` is a variable:

```
instantiation_error
```

`Host` is neither a variable nor an atom:

```
type_error(atom,Host)
```

`Port` is neither a variable nor an integer:

```
type_error(integer,Port)
```

`Port` is an integer but not positive:

```
domain_error(positive_integer,Port)
```

`Message` is not an SMTP message term:

```
domain_error(smtp_message,Message)
```

The envelope sender or a recipient is a variable:

```
instantiation_error
```

The envelope sender or a recipient is neither a variable nor an atom:

```
type_error(atom,Mailbox)
```

The envelope sender or a recipient is not a valid mailbox:

```
domain_error(smtp_mailbox,Mailbox)
```

`Recipients` is not a non-empty list of mailboxes or a mailbox atom:

```
domain_error(smtp_recipients,Recipients)
```

`Headers` is not a list:

```
type_error(list,Headers)
```

A header name or value is a variable:

```
instantiation_error
```

A header name or value is neither a variable nor an atom:

```
type_error(atom,HeaderComponent)
```

`Header` is not a valid header pair:

```
domain_error(smtp_header,Header)
```

`Body` is not a supported text representation:

```
domain_error(smtp_body,Body)
```

A caller-supplied MIME header conflicts with UTF-8 Base64 serialization or duplicates another MIME header:

```
domain_error(smtp_mime_header,Header)
```

`Options` is a variable:

```
instantiation_error
```

`Options` is neither a variable nor a list:

```
type_error(list,Options)
```

An element `Option` of the list `Options` is a variable:

```
instantiation_error
```

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

The SMTP connection cannot be opened:

```
smtp_error(connection_failed)
```

OpenSSL terminates the secure connection while an SMTP response is expected:

```
smtp_error(secure_connection_failed(Status,Diagnostic))
```

The SMTP server closes the connection while a response is expected at `Stage`:

```
smtp_error(connection_closed(Stage))
```

The SMTP server rejects the session greeting:

```
smtp_error(greeting_failed(Code,Lines))
```

The SMTP server returns an invalid or unexpected response:

`smtp_error(protocol_error(Response))`

Authentication is requested over an insecure connection without explicit permission:

`permission_error(authenticate,insecure_smtp_connection,plain)`

The SMTP server does not advertise a supported authentication mechanism:

`smtp_error(authentication_not_supported)`

The SMTP server rejects authentication:

`smtp_error(auth_failed(Code,Lines))`

The SMTP server rejects the envelope sender:

`smtp_error(sender_rejected(Code,Lines))`

The SMTP server rejects the DATA command or the submitted message:

`smtp_error(send_failed(Code,Lines))`

---

connect/4

Opens an SMTP session for sending one or more messages.

Compilation flags:

`static`

Template:

`connect(Host,Port,Connection,Options)`

Mode and number of proofs:

`connect(+atom,+integer,--compound,+list)` - `one_or_error`

Exceptions:

`Host` or `Port` is a variable:

`instantiation_error`

`Host` is neither a variable nor an atom:

`type_error(atom,Host)`

`Port` is neither a variable nor an integer:

`type_error(integer,Port)`

`Port` is an integer but not positive:

`domain_error(positive_integer,Port)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Option` is valid but is not a connection option:

`domain_error(smtp_connection_option,Option)`

The SMTP connection cannot be opened:

`smtp_error(connection_failed)`

OpenSSL terminates the secure connection while an SMTP response is expected:
`smtp_error(secure_connection_failed(Status,Diagnostic))`
The SMTP server closes the connection while a response is expected at `Stage`:
`smtp_error(connection_closed(Stage))`
The SMTP server rejects the session greeting:
`smtp_error(greeting_failed(Code,Lines))`
The SMTP server returns an invalid or unexpected response:
`smtp_error(protocol_error(Response))`
Authentication is requested over an insecure connection without explicit permission:
`permission_error(authenticate,insecure_smtp_connection,plain)`
The SMTP server does not advertise a supported authentication mechanism:
`smtp_error(authentication_not_supported)`
The SMTP server rejects authentication:
`smtp_error(auth_failed(Code,Lines))`

---

disconnect/1

Gracefully closes an SMTP session.

Compilation flags:
`static`

Template:
`disconnect(Connection)`
Mode and number of proofs:
`disconnect(+compound)` - `one_or_error`

Exceptions:
`Connection` is not an open SMTP connection handle:
`domain_error(smtp_connection,Connection)`

---

connection_alive/1

Checks if the local streams for an SMTP connection are open.

Compilation flags:
`static`

Template:
`connection_alive(Connection)`
Mode and number of proofs:
`connection_alive(+compound)` - `zero_or_one`

---

send/4

Sends a message over an open SMTP session. Unicode `Subject` and `Comments` header values are serialized as RFC 2047 UTF-8 Base64 encoded words; all other header values must be ASCII.

Compilation flags:

`static`

Template:

`send(Connection,Message,Result,Options)`

Mode and number of proofs:

`send(+compound,+compound,--compound,+list)` - `one_or_error`

Exceptions:

`Connection` is not an open SMTP connection handle:

`domain_error(smtp_connection,Connection)`

`Message` is not an SMTP message term:

`domain_error(smtp_message,Message)`

The envelope sender or a recipient is a variable:

`instantiation_error`

The envelope sender or a recipient is neither a variable nor an atom:

`type_error(atom,Mailbox)`

The envelope sender or a recipient is not a valid mailbox:

`domain_error(smtp_mailbox,Mailbox)`

`Recipients` is not a non-empty list of mailboxes or a mailbox atom:

`domain_error(smtp_recipients,Recipients)`

`Headers` is not a list:

`type_error(list,Headers)`

A header name or value is a variable:

`instantiation_error`

A header name or value is neither a variable nor an atom:

`type_error(atom,HeaderComponent)`

`Header` is not a valid header pair:

`domain_error(smtp_header,Header)`

`Body` is not a supported text representation:

`domain_error(smtp_body,Body)`

A caller-supplied MIME header conflicts with UTF-8 Base64 serialization or duplicates another MIME header:

`domain_error(smtp_mime_header,Header)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

`Option` is valid but is not a transaction option:

`domain_error(smtp_transaction_option,Option)`

The SMTP server closes the connection while a response is expected at `Stage`:
`smtp_error(connection_closed(Stage))`
The SMTP server returns an invalid or unexpected response:
`smtp_error(protocol_error(Response))`
The SMTP server rejects the envelope sender:
`smtp_error(sender_rejected(Code,Lines))`
The SMTP server rejects the DATA command or the submitted message:
`smtp_error(send_failed(Code,Lines))`

list

Remarks:

- Supported backends: ECLiPSe, GNU Prolog, SICStus Prolog, Shumway Prolog, SWI-Prolog, Trealla Prolog, and XVM.
- Design rationale: Some backends (notably SICStus Prolog) do not provide low-level socket creation predicates that can be separated from binding or connecting. This library therefore provides a higher-level API with `client_open/5` and `server_open/3` that abstracts over these differences.
- Stream handling: Predicates `client_open/5` and `server_accept/5` return separate input and output streams opened in binary mode. For backends where the same stream is used for bidirectional communication, the same stream handle is returned in both arguments. Use standard stream predicates (`put_byte/2`, `get_byte/2`, `read/2`, `write/2`, etc.) to communicate.
- Options: Currently options are only defined for the `server_open/3` predicate. This is expected to change in future versions for the other predicates that have an options argument.

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*
  - *client_open/5*

Public predicates

client_open/5

Opens a client connection to the specified host and port using the given options. Returns separate input and output streams for bidirectional communication. The streams are opened by default in binary mode.

Compilation flags:

`static`

Template:

```
client_open(Host,Port,InputStream,OutputStream,Options)
```

Mode and number of proofs:

```
client_open(+atom,+integer,--stream,--stream,+list) - one_or_error
```

Exceptions:

Connection refused or host not found:

```
socket_error(Error)
```

Remarks:

- Option `type(binary)`: Open the streams in binary mode. This is the default.
- Option `type(text)`: Open the streams in text mode.

---

client_open/4

Opens a client connection to the specified host and port using default options. Returns separate input and output streams for bidirectional communication. The streams are opened in binary mode.

Compilation flags:

```
static
```

Template:

```
client_open(Host,Port,InputStream,OutputStream)
```

Mode and number of proofs:

```
client_open(+atom,+integer,--stream,--stream) - one_or_error
```

Exceptions:

Connection refused or host not found:

```
socket_error(Error)
```

---

server_open/4

Opens a server socket bound to the specified host and port using the given options. If `Port` is a variable, binds to an available port and unifies `Port` with the port number. Returns a `ServerSocket` handle to use with `server_accept/4`. The default backlog (queue length) for pending connections is 5. Use the option `backlog(N)` to override. This option is not supported and thus ignored by the SICStus Prolog and Trealla Prolog backends.

Compilation flags:

```
static
```

Template:

```
server_open(Host,Port,ServerSocket,Options)
```

Mode and number of proofs:

```
server_open(+atom,?integer,--compound,+list) - one_or_error
```

Exceptions:

Port already in use:
`socket_error(Error)`

---

server_open/3

Opens a server socket bound to the specified port using the given options. If `Port` is a variable, binds to an available port and unifies `Port` with the port number. Returns a `ServerSocket` handle to use with `server_accept/4`. The default backlog (queue length) for pending connections is 5. Use the option `backlog(N)` to override. This option is not supported and thus ignored by the SICStus Prolog and Trealla Prolog backends.

Compilation flags:
`static`

Template:
`server_open(Port,ServerSocket,Options)`
Mode and number of proofs:
`server_open(?integer,--compound,+list)` - `one_or_error`

Exceptions:
Port already in use:
`socket_error(Error)`

---

server_open/2

Opens a server socket bound to the specified port using default options. If `Port` is a variable, binds to an available port and unifies `Port` with the port number. Returns a `ServerSocket` handle to use with `server_accept/4`. The default backlog (queue length) for pending connections is 5.

Compilation flags:
`static`

Template:
`server_open(Port,ServerSocket)`
Mode and number of proofs:
`server_open(?integer,--compound)` - `one_or_error`

Exceptions:
Port already in use:
`socket_error(Error)`

---

server_accept/5

Accepts an incoming connection on the server socket, blocking until a client connects, using the given options. Returns separate input and output streams for bidirectional communication and client information as `client(Host, Port)` or `client(Address)` depending on backend. The streams are opened by default in binary mode.

Compilation flags:

`static`

Template:

`server_accept(ServerSocket,InputStream,OutputStream,ClientInfo,Options)`

Mode and number of proofs:

`server_accept(+compound,--stream,--stream,--compound,+list)` - `one_or_error`

Exceptions:

Invalid server socket:

`socket_error(Error)`

Remarks:

- Option `type(binary)`: Open the streams in binary mode. This is the default.
- Option `type(text)`: Open the streams in text mode.

---

server_accept/4

Accepts an incoming connection on the server socket, blocking until a client connects, using default options. Returns separate input and output streams for bidirectional communication and client information as `client(Host, Port)` or `client(Address)` depending on backend. The streams are opened in binary mode.

Compilation flags:

`static`

Template:

`server_accept(ServerSocket,InputStream,OutputStream,ClientInfo)`

Mode and number of proofs:

`server_accept(+compound,--stream,--stream,--compound)` - `one_or_error`

Exceptions:

Invalid server socket:

`socket_error(Error)`

---

server_close/1

Closes a server socket.

Compilation flags:
`static`

Template:
`server_close(ServerSocket)`
Mode and number of proofs:
`server_close(+compound)` - `one_or_error`

---

close/2

Closes a client or accepted connection by closing both the input and output streams. If the same stream is used for both, it is closed only once.

Compilation flags:
`static`

Template:
`close(InputStream,OutputStream)`
Mode and number of proofs:
`close(+stream,+stream)` - `one_or_error`

Exceptions:
Error when trying to close the socket streams:
`socket_error(Error)`

---

current_host/1

Returns the host name of the current machine.

Compilation flags:
`static`

Template:
`current_host(Host)`
Mode and number of proofs:
`current_host(-atom)` - `one_or_error`

Exceptions:
Error when trying to get the current host name:
`socket_error(Error)`

list
type

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*

  - *decode/8*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

decode/8

Decodes captured stdout, stderr, per-relation CSV file content, and process metadata into a collected `souffle_result(Relations, Sizes, Properties)` term.

Compilation flags:

`static`

Template:

`decode(Codes,Diagnostics,RelationCodes,RawStatus,NormalizedStatus,Outputs,Printsizes,Result)`

Mode and number of proofs:

`decode(+list(code),+list(code),+list(compound),+term,+compound,+list(pair),+list(atom),-compound)` - `one_or_error`

Exceptions:

`Codes` is a partial list or a list with an element `Element` which is a variable:

`instantiation_error`

`Codes` is neither a partial list nor a list of character codes:

`type_error(codes,Codes)`

`Diagnostics` is a partial list or a list with an element `Element` which is a variable:

`instantiation_error`

`Diagnostics` is neither a partial list nor a list of character codes:

`type_error(codes,Diagnostics)`

`RelationCodes`, `Outputs`, or `Printsizes` is a partial list or has a variable element:

`instantiation_error`

`RelationCodes`, `Outputs`, or `Printsizes` is neither a partial list nor a list:

`type_error(list,RelationCodes)`

`RawStatus` is not a ground term:

`instantiation_error`

`NormalizedStatus` is not a ground term:

`instantiation_error`

`NormalizedStatus` is not `exit(0)`:

`domain_error(souffle_process_status,NormalizedStatus)`

A requested relation in `Outputs` has no entry, or a `missing` entry, in `RelationCodes`:

`domain_error(souffle_output,Name-missing)`

A CSV row for a requested relation has a different number of columns than declared in `Outputs`:

`domain_error(souffle_output,column_count-(Row-Types))`

A `number` or `unsigned` column value is not a valid integer, or an `unsigned` value is negative:

`domain_error(souffle_output,Type-Value)`

A `float` column value is not a valid number:

`domain_error(souffle_output,float-Value)`

A requested relation in `Printsizes` has no matching `Name\tCount` line in `Codes`:
`domain_error(souffle_output,Name-missing)`

Protected predicates

- *Operators*

Public predicates

quote/3

Quotes an atom as one POSIX shell or Windows PowerShell literal, without interpolation.

Compilation flags:
`static`

Template:
`quote(Platform,Argument,Quoted)`
Mode and number of proofs:
`quote(+atom,+atom,-atom)` - `one_or_error`

Exceptions:
`Platform` is a variable:
`instantiation_error`
`Argument` is a variable:
`instantiation_error`
`Platform` is neither a variable nor an atom:
`type_error(atom,Platform)`
`Argument` is neither a variable nor an atom:
`type_error(atom,Argument)`
`Platform` is an atom but neither `posix` nor `windows`:
`domain_error(souffle_shell_platform,Platform)`
`Argument` is an atom but contains a null character:
`domain_error(souffle_shell_argument,Argument)`

run/10

Runs the CLI using an owned directory and separate UTF-8 capture files, materializing EDB facts and reading back requested `.output` relation files before cleanup, returning only after cleanup.

Compilation flags:

`static`

Template:

`run(Executable,Arguments,ProgramSource,FactsSpec,OutputRelations,Codes,Diagnostics,RelationCodes,RawStatus,NormalizedStatus)`

Mode and number of proofs:

`run(+atom,+list(atom),+compound,+compound,+list(atom),-list(integer),-list(integer),-list(compound),-term,-compound)` - `one_or_error`

Exceptions:

`Executable`, `Arguments`, `ProgramSource`, `FactsSpec`, or `OutputRelations` is a variable:

`instantiation_error`

An element of the list `Arguments` or `OutputRelations` is a variable:

`instantiation_error`

`Executable` is neither a variable nor an atom:

`type_error(atom,Executable)`

`Arguments` is neither a variable nor a list:

`type_error(list,Arguments)`

An element of the list `Arguments` is neither a variable nor an atom:

`type_error(atom,Argument)`

An element of the list `OutputRelations` is neither a variable nor an atom:

`type_error(atom,Name)`

`ProgramSource` is neither `file(Path)` nor `codes(Codes)`:

`domain_error(souffle_process_source,ProgramSource)`

`FactsSpec` is neither `none`, `external(Path)`, nor `materialize(Pairs)`:

`domain_error(souffle_facts_spec,FactsSpec)`

A materialized facts row has a symbol column value containing a tab or newline character, or a value that is not an integer, float, or atom:

`domain_error(souffle_facts_value,Value)`

An argument contains a null character:

`domain_error(souffle_shell_argument,Argument)`

A launcher dependency does not exist:

`existence_error(command,Command)`

A source or capture file does not exist:

`existence_error(source_sink,Path)`

A source or capture file cannot be opened:

`permission_error(open,source_sink,Path)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

```
souffle_transport(Stage,Status,Details)
```

Public predicates

serialize/2

Serializes ground canonical Datalog statements to character codes.

Compilation flags:
`static`

Template:
`serialize(Statements,Codes)`
Mode and number of proofs:
`serialize(+list,-list(integer))` - `one_or_error`

Exceptions:
`Statements` is a partial list or a list with an element `Statement` which is a variable:
`instantiation_error`
`Statements` is neither a partial list nor a list:
`type_error(list,Statements)`
An element `Statement` of the list `Statements` is not a valid statement:
`domain_error(souffle_statement,Statement)`

---

serialize/4

Serializes statements with origins and returns `line(Start, End, Origin)` source-map entries.

Compilation flags:
`static`

Template:
`serialize(Statements,Origins,Codes,SourceMap)`
Mode and number of proofs:
`serialize(+list,+list,-list(code),-list(compound))` - `one_or_error`

Exceptions:
`Statements` is a partial list or a list with an element `Statement` which is a variable:
`instantiation_error`
`Statements` is neither a partial list nor a list:
`type_error(list,Statements)`
An element `Statement` of the list `Statements` is not a valid statement:
`domain_error(souffle_statement,Statement)`
`Origins` is a partial list or a list with an element `Origin` which is a variable:
`instantiation_error`
`Origins` is neither a variable nor a list:
`type_error(list,Origins)`
`Origins` has an element that is neither `unknown` nor a valid `source(File, Start, End)` term, or its length differs from `Statements`:
`domain_error(souffle_origins,Origins)`

---

valid_identifier/1

True if the argument is a supported Datalog relation, column, or type identifier (a lowercase or underscore led name).

Compilation flags:
`static`

Template:
`valid_identifier(Name)`
Mode and number of proofs:
`valid_identifier(@term)` - `zero_or_one`

---

valid_column_type/1

True if the argument is one of the four supported primitive column types.

Compilation flags:
`static`

Template:
`valid_column_type(Type)`
Mode and number of proofs:
`valid_column_type(@term)` - `zero_or_one`

Protected predicates

Public predicates

solve/2

Solves a source with default options using the external Souffle CLI and returns a collected result after cleanup. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`. No `.output`/`.printsize` relations are decoded unless requested via the `outputs/1`/`printsizes/1` options of `solve/3`.

Compilation flags:
`static`

Template:

`solve(Source,Result)`

Mode and number of proofs:

`solve(+compound,-compound)` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `souffle_problem_protocol`:

`domain_error(souffle_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(souffle_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(souffle_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

A launcher argument contains a null character:

`domain_error(souffle_shell_argument,Argument)`

The `souffle` executable or a shell dependency does not exist:

`existence_error(command,Command)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

`souffle_transport(Stage,Status,Details)`

Solver output is invalid or inconsistent with its exit status:

`souffle_solver_error(Formal,Status,Diagnostics,SourceMap)`

solve/3

Solves a source using executable, parallelism, warning, compilation, EDB facts, and decoded-relation options. Repeated options use the first occurrence. Valid sources are `object(Object)`, `terms(Statements)`, `codes(Codes)`, and `file(Path)`. The `outputs/1` option lists which `.output` relations to decode and their column types; the `printsizes/1` option lists which `.printsize` relations to decode.

Compilation flags:

`static`

Template:

`solve(Source,Result,Options)`

Mode and number of proofs:

`solve(+compound,-compound,+list(compound))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `souffle_problem_protocol`:

`domain_error(souffle_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(souffle_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(souffle_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Both `facts/1` and `facts_data/1` are given with non-default values:

`domain_error(souffle_facts_option,facts(Path)-facts_data(Pairs))`

An element of `facts_data/1` has a symbol column value containing a tab or newline character, or a value that is not an integer, float, or atom:

`domain_error(souffle_facts_value,Value)`

A launcher argument contains a null character:

`domain_error(souffle_shell_argument,Argument)`

The `souffle` executable or a shell dependency does not exist:

`existence_error(command,Command)`

An owned directory cannot be found during cleanup:

`existence_error(directory,Directory)`

An owned file or directory cannot be removed:

`permission_error(delete,source_sink,Path)`

A character sequence is not valid UTF-8:

`representation_error(utf_8)`

A launcher operation fails:

`souffle_transport(Stage,Status,Details)`

Solver output is invalid or inconsistent with its exit status:

`souffle_solver_error(Formal,Status,Diagnostics,SourceMap)`

`program/1`

Generates and prints Datalog source to the current output, equivalent to `program/2` followed by `print_program/1`, without invoking Souffle.

Compilation flags:

`static`

Template:

`program(Source)`

Mode and number of proofs:

`program(+compound)` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `souffle_problem_protocol`:

`domain_error(souffle_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(souffle_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(souffle_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:

`permission_error(open,source_sink,Path)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

---

program/2

Returns Datalog source codes from `object(Object)`, `terms(Statements)`, `codes(Codes)`, or `file(Path)` without invoking Souffle.

Compilation flags:

`static`

Template:

`program(Source,Codes)`

Mode and number of proofs:

`program(+compound,-list(integer))` - `one_or_error`

Exceptions:

`Source` is not a ground term:

`instantiation_error`

`Source` is ground but not a supported source, or is `object(Object)` where `Object` does not implement `souffle_problem_protocol`:

`domain_error(souffle_source,Source)`

`Statements` is ground but not a list:

`type_error(list,Statements)`

A statement enumerated by the provider object is not a valid statement:

`domain_error(souffle_statement,Statement)`

An origin enumerated by the provider object is invalid, or its origins and statements differ in length:

`domain_error(souffle_origins,Origins)`

`Codes` is ground but not a list of character codes:

`type_error(codes,Codes)`

An element `Code` of the list `Codes` is ground but not an integer:

`type_error(integer,Code)`

An element `Code` of the list `Codes` is an integer but not a valid character code:

`domain_error(character_code,Code)`

`Path` is ground but not an atom:

`type_error(atom,Path)`

`Path` does not exist:

`existence_error(source_sink,Path)`

`Path` cannot be opened for reading:
`permission_error(open,source_sink,Path)`

---

print_program/1

Prints Datalog character codes to the current output without adding a newline or invoking Souffle.

Compilation flags:
`static`

Template:
`print_program(Codes)`
Mode and number of proofs:
`print_program(+list(integer))` - `one_or_error`

Exceptions:
`Codes` is not a ground term:
`instantiation_error`
`Codes` is ground but not a list of character codes:
`type_error(codes,Codes)`
An element `Code` of the list `Codes` is ground but not an integer:
`type_error(integer,Code)`
An element `Code` of the list `Codes` is an integer but not a valid character code:
`domain_error(character_code,Code)`
The current output stream does not allow writing:
`permission_error(output,stream,Stream)`

---

relation/4

Enumerates, by backtracking, decoded `.output` relations collected in a result: the relation name, its requested column types, and its rows (each row a list of decoded Prolog values, one per column).

Compilation flags:
`static`

Template:
`relation(Result,Name,Columns,Rows)`
Mode and number of proofs:
`relation(+compound,?atom,?list(atom),?list(list))` - `zero_or_more`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected Souffle result:
`domain_error(souffle_result,Result)`

---

size/3

Enumerates, by backtracking, decoded `.printsize` relation counts collected in a result.

Compilation flags:
`static`

Template:
`size(Result,Name,Count)`
Mode and number of proofs:
`size(+compound,?atom,?integer)` - `zero_or_more`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected Souffle result:
`domain_error(souffle_result,Result)`

---

result_property/2

Enumerates, by backtracking, the stored result properties (`raw_status/1`, `process_status/1`, and `diagnostics/1`).

Compilation flags:
`static`

Template:
`result_property(Result,Property)`
Mode and number of proofs:
`result_property(+compound,?compound)` - `zero_or_more`

Exceptions:
`Result` is not a ground term:
`instantiation_error`
`Result` is not a valid collected Souffle result:
`domain_error(souffle_result,Result)`

---

print_result/1

Prints collected relations and printsize counts to the current output, without invoking Souffle.

Compilation flags:
`static`

Template:
`print_result(Result)`

Mode and number of proofs:

`print_result(+compound)` - `one_or_error`

Exceptions:

`Result` is not a ground term:

`instantiation_error`

`Result` is not a valid collected Souffle result:

`domain_error(souffle_result,Result)`

The current output stream does not allow writing:

`permission_error(output,stream,Stream)`

Public predicates

encode/2

Encodes a list of non-negative integers into an identifier using the default options.

Compilation flags:

`static`

Template:

`encode(Numbers,Id)`

Mode and number of proofs:

`encode(+list(integer),-text)` - `one`

Exceptions:

`Numbers` is a variable or a partial list:

`instantiation_error`

`Numbers` is neither a variable nor a list:

`type_error(list(non_negative_integer),Numbers)`

An element `Number` of the list `Numbers` is not an integer:

`type_error(integer,Number)`

An element `Number` of the list `Numbers` of Numbers is a negative integer:

`domain_error(non_negative_integer,Number)`

Too many blocklist collisions occurred while generating the id:

`resource_error(blocklist_retries)`

---

encode/3

Encodes a list of non-negative integers into an id using the given options. Recognized options are alphabet(Atom) (an atom with at least three unique characters; default is the standard 62-character alphabet), min_length(Integer) (an integer between 0 and 255; default is 0), and blocklist(list(atom)) (words that must not occur in the generated id; default is []). If Numbers is empty, Id is unified with the empty atom regardless of the other options.

Compilation flags:

`static`

Template:

```
encode(Numbers,Id,Options)
```

Mode and number of proofs:

```
encode(+list(integer),-text,+list(compound)) - one_or_error
```

Exceptions:

`Numbers` is a variable or a partial list:

```
instantiation_error
```

`Numbers` is neither a variable nor a list:

```
type_error(list(non_negative_integer),Numbers)
```

An element `Number` of the list `Numbers` is not an integer:

```
type_error(integer,Number)
```

An element `Number` of the list `Numbers` of Numbers is a negative integer:

```
domain_error(non_negative_integer,Number)
```

`Options` is a variable or a partial list:

```
instantiation_error
```

`Options` is neither a variable nor a list:

```
type_error(list,Options)
```

An element `Option` of the list `Options` is neither a variable nor a compound term:

```
type_error(compound,Option)
```

An element `Option` of the list `Options` is a compound term but not a valid option:

```
domain_error(option,Option)
```

Too many blocklist collisions occurred while generating the id:

```
resource_error(blocklist_retries)
```

---

decode/2

Decodes an identifier back into a list of non-negative integers using the default options. Equivalent to decode/3 with an empty options list. Numbers is [] if Id is the empty atom or contains a character that is not in the alphabet. Decoding does not check that Id is a canonical (minimal) encoding: ids rejected by encode/2-3 due to the blocklist still decode successfully, as do ids with extraneous minimum-length padding.

Compilation flags:

```
static
```

Template:

```
decode(Id,Numbers)
```

Mode and number of proofs:

```
decode(+text,-list(integer)) - one_or_error
```

Exceptions:

`Id` is a variable:

```
instantiation_error
```

`Id` is neither a variable nor an atom:

```
type_error(atom,Id)
```

---

decode/3

Decodes an identifier back into a list of non-negative integers using the given options. The only recognized option is alphabet(Atom); it must be the same alphabet that was used to encode Id. Numbers is [] if Id is the empty atom or contains a character that is not in the alphabet.

Compilation flags:

`static`

Template:

`decode(Id,Numbers,Options)`

Mode and number of proofs:

`decode(+text,-list(integer),+list(compound))` - `one_or_error`

Exceptions:

`Id` is a variable:

`instantiation_error`

`Id` is neither a variable nor an atom:

`type_error(atom,Id)`

`Options` is a variable or a partial list:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

arithmetic_mean/5

Auxiliary predicate for computing the arithmetic mean.

Compilation flags:

```
static
```

Template:

```
arithmetic_mean(List,Length0,Length,Sum,Mean)
```

Mode and number of proofs:

```
arithmetic_mean(+list(number),+integer,-integer,+number,-float) - one
```

squares_and_cubes/6

Auxiliary predicate for computing the skewness.

Compilation flags:
`static`

Template:
`squares_and_cubes(List,Mean,Squares0,Squares,Cubes0,Cubes)`
Mode and number of proofs:
`squares_and_cubes(+list(number),+float,+float,-float,+float,-float)` - `one`

---

squares_and_hypers/6

Auxiliary predicate for computing the kurtosis.

Compilation flags:
`static`

Template:
`squares_and_hypers(List,Mean,Squares0,Squares,Hypers0,Hypers)`
Mode and number of proofs:
`squares_and_hypers(+list(number),+float,+float,-float,+float,-float)` - `one`

---

variance/6

Auxiliary predicate for computing the variance.

Compilation flags:
`static`

Template:
`variance(List,Length0,Length,Mean,M20,M2)`
Mode and number of proofs:
`variance(+list(number),+integer,-integer,+float,+float,-float)` - `one`

---

cross_deviation_sum/6

Auxiliary predicate for computing the cross-deviation sum for covariance.

Compilation flags:
```
static
```

Template:
```
cross_deviation_sum(List1,List2,Mean1,Mean2,Sum0,Sum)
```
Mode and number of proofs:
```
cross_deviation_sum(+list(number),+list(number),+float,+float,+float,-float) - one
```

---

sorted_median/3

Auxiliary predicate for computing the median of an already sorted list with known length.

Compilation flags:
```
static
```

Template:
```
sorted_median(Sorted,Length,Median)
```
Mode and number of proofs:
```
sorted_median(+list(number),+integer,-number) - one
```

---

sum_of_squares/4

Auxiliary predicate for computing the sum of squared deviations.

Compilation flags:
```
static
```

Template:
```
sum_of_squares(List,Mean,Sum0,Sum)
```
Mode and number of proofs:
```
sum_of_squares(+list(number),+float,+float,-float) - one
```

---

central_moment_sum/7

Auxiliary predicate for computing central moments.

Compilation flags:

```
static
```

Template:

```
central_moment_sum(List,K,Mean,N0,Sum0,N,Sum)
```

Mode and number of proofs:

```
central_moment_sum(+list(number),+positive_integer,+float,+integer,+float,
-integer,-float) - one
```

---

min_max_normalize/4

Auxiliary predicate for min-max normalization.

Compilation flags:

```
static
```

Template:

```
min_max_normalize(List,Min,Range,NormalizedList)
```

Mode and number of proofs:

```
min_max_normalize(+list(number),+number,+number,-list(float)) - one
```

---

count_frequencies/4

Auxiliary predicate for computing frequency distribution.

Compilation flags:

```
static
```

Template:

```
count_frequencies(List,CurrentValue,CurrentCount,Distribution)
```

Mode and number of proofs:

```
count_frequencies(+list(number),+number,+integer,-list(pair(number,integer))) -
one
```

---

squared_error_sum/6

Auxiliary predicate for computing mean squared error.

Compilation flags:
`static`

Template:
`squared_error_sum(List1,List2,N0,Sum0,N,Sum)`
Mode and number of proofs:
`squared_error_sum(+list(number),+list(number),+integer,+float,-integer,-float)` - `one`

---

compute_ranks/3

Auxiliary predicate for computing ranks of elements in a list.

Compilation flags:
`static`

Template:
`compute_ranks(List,All,Ranks)`
Mode and number of proofs:
`compute_ranks(+list(number),+list(number),-list(float))` - `one`

---

count_less_equal/6

Auxiliary predicate for counting elements less than and equal to a value.

Compilation flags:
`static`

Template:
`count_less_equal(List,Value,Less0,Less,Equal0,Equal)`
Mode and number of proofs:
`count_less_equal(+list(number),+number,+integer,-integer,+integer,-integer)` - `one`

Operators

(none)
protocol

1.307.4 statisticsp

Statistical calculations over a list of numbers protocol.

Public predicates

product/2

Calculates the product of all list numbers. Fails if the list is empty.

Compilation flags:

```
static
```

Template:

```
product(List,Product)
```

Mode and number of proofs:

```
product(+list(number),-number) - zero_or_one
```

sum/2

Calculates the sum of all list numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`sum(List,Sum)`
Mode and number of proofs:
`sum(+list(number),-number)` - `zero_or_one`

---

min/2

Determines the minimum value in a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`min(List,Minimum)`
Mode and number of proofs:
`min(+list,-number)` - `zero_or_one`

---

max/2

Determines the list maximum value in a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`max(List,Maximum)`
Mode and number of proofs:
`max(+list,-number)` - `zero_or_one`

---

min_max/3

Determines the minimum and maximum values in a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`min_max(List,Minimum,Maximum)`
Mode and number of proofs:
`min_max(+list(number),-number,-number)` - `zero_or_one`

---

range/2

Range is the length of the smallest interval which contains all the numbers in List. Fails if the list is empty.

Compilation flags:
`static`

Template:
`range(List,Range)`
Mode and number of proofs:
`range(+list,-number)` - `zero_or_one`

---

arithmetic_mean/2

Calculates the arithmetic mean of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`arithmetic_mean(List,Mean)`
Mode and number of proofs:
`arithmetic_mean(+list(number),-float)` - `zero_or_one`

---

geometric_mean/2

Calculates the geometric mean of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`geometric_mean(List,Mean)`
Mode and number of proofs:
`geometric_mean(+list(number),-float)` - `zero_or_one`

---

harmonic_mean/2

Calculates the harmonic mean of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`harmonic_mean(List,Mean)`
Mode and number of proofs:
`harmonic_mean(+list(number),-float)` - `zero_or_one`

---

weighted_mean/3

Calculates the weighted mean of a list of numbers. Fails if the list is empty or if the two lists have different lengths. Weights are assumed to be non-negative.

Compilation flags:
`static`

Template:
`weighted_mean(Weights,List,Mean)`
Mode and number of proofs:
`weighted_mean(+list(number),+list(number),-float)` - `zero_or_one`

---

median/2

Calculates the median of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`median(List,Median)`
Mode and number of proofs:
`median(+list(number),-float)` - `zero_or_one`

---

modes/2

Returns the list of modes of a list of numbers in ascending order. Fails if the list is empty.

Compilation flags:
`static`

Template:
`modes(List,Modes)`
Mode and number of proofs:
`modes(+list(number),-list(number))` - `zero_or_one`

---

average_deviation/3

Calculates the average absolute deviation of a list of numbers given a central tendency (e.g., mean, median, or mode). Fails if the list is empty.

Compilation flags:
`static`

Template:
`average_deviation(List,CentralTendency,Deviation)`
Mode and number of proofs:
`average_deviation(+list(number),+float,-float)` - `zero_or_one`

---

mean_deviation/2

Calculates the mean absolute deviation of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`mean_deviation(List,Deviation)`
Mode and number of proofs:
`mean_deviation(+list(number),-float)` - `zero_or_one`

---

median_deviation/2

Calculates the median absolute deviation of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`median_deviation(List,Deviation)`
Mode and number of proofs:
`median_deviation(+list(number),-float)` - `zero_or_one`

---

standard_deviation/2

Calculates the standard deviation of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`standard_deviation(List,Deviation)`
Mode and number of proofs:
`standard_deviation(+list(number),-float)` - `zero_or_one`

---

coefficient_of_variation/2

Calculates the coefficient of variation of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`coefficient_of_variation(List,Coefficient)`
Mode and number of proofs:
`coefficient_of_variation(+list(number),-float)` - `zero_or_one`

---

relative_standard_deviation/2

Calculates the relative standard deviation of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`relative_standard_deviation(List,Percentage)`
Mode and number of proofs:
`relative_standard_deviation(+list(number),-float)` - `zero_or_one`

---

skewness/2

Calculates the (moment) skewness of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`skewness(List,Skewness)`
Mode and number of proofs:
`skewness(+list(number),-float)` - `zero_or_one`

---

kurtosis/2

Calculates the (excess) kurtosis of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`kurtosis(List,Kurtosis)`
Mode and number of proofs:
`kurtosis(+list(number),-float)` - `zero_or_one`

---

variance/2

Calculates the unbiased variance of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`variance(List,Variance)`
Mode and number of proofs:
`variance(+list(number),-float)` - `zero_or_one`

---

z_normalization/2

Normalizes a list of number such that for the resulting list the mean of is close to zero and the standard deviation is close to 1. Fails if the list is empty.

Compilation flags:
`static`

Template:
`z_normalization(List,NormalizedList)`
Mode and number of proofs:
`z_normalization(+list(number),-list(float))` - `zero_or_one`

---

fractile/3

Calculates the smallest value in a list of numbers such that the list elements in its fraction `P` are less or equal to that value (with `P` in the open interval `(0.0, 1.0)`). Fails if the list is empty.

Compilation flags:
`static`

Template:
`fractile(P,List,Fractile)`
Mode and number of proofs:
`fractile(+float,+list(integer),-integer)` - `zero_or_one`
`fractile(+float,+list(float),-float)` - `zero_or_one`

---

percentile/3

Calculates the P-th percentile of a list of numbers (with `P` in the open interval `(0, 100)`). Fails if the list is empty.

Compilation flags:
`static`

Template:
`percentile(P,List,Percentile)`
Mode and number of proofs:
`percentile(+number,+list(number),-number)` - `zero_or_one`

---

quartiles/4

Calculates the quartiles (Q1, Q2, Q3) of a list of numbers. Q2 is the median. Q1 and Q3 are the medians of the lower and upper halves, respectively. Fails if the list has fewer than two elements.

Compilation flags:
`static`

Template:
`quartiles(List,Q1,Q2,Q3)`
Mode and number of proofs:
`quartiles(+list(number),-number,-number,-number)` - `zero_or_one`

---

interquartile_range/2

Calculates the interquartile range (Q3 - Q1) of a list of numbers. Fails if the list has fewer than two elements.

Compilation flags:
```
static
```

Template:
```
interquartile_range(List,IQR)
```
Mode and number of proofs:
```
interquartile_range(+list(number),-number) - zero_or_one
```

---

covariance/3

Calculates the covariance of two lists of numbers. Fails if the lists are empty or have different lengths.

Compilation flags:
```
static
```

Template:
```
covariance(List1,List2,Covariance)
```
Mode and number of proofs:
```
covariance(+list(number),+list(number),-float) - zero_or_one
```

---

correlation/3

Calculates the Pearson correlation coefficient of two lists of numbers. Fails if the lists are empty or have different lengths.

Compilation flags:
```
static
```

Template:
```
correlation(List1,List2,Correlation)
```
Mode and number of proofs:
```
correlation(+list(number),+list(number),-float) - zero_or_one
```

---

rank_correlation/3

Calculates the Spearman rank correlation coefficient of two lists of numbers. Handles ties using average ranks. Fails if the lists are empty or have different lengths.

Compilation flags:
```
static
```

Template:
```
rank_correlation(List1,List2,Correlation)
```
Mode and number of proofs:
```
rank_correlation(+list(number),+list(number),-float) - zero_or_one
```

---

trimmed_mean/3

Calculates the trimmed mean of a list of numbers by removing a fraction of extreme values from both ends (with the fraction in the half-open interval `[0.0, 0.5)`). Fails if the list is empty or if too many elements would be trimmed.

Compilation flags:
```
static
```

Template:
```
trimmed_mean(Fraction,List,Mean)
```
Mode and number of proofs:
```
trimmed_mean(+float,+list(number),-float) - zero_or_one
```

---

sum_of_squares/2

Calculates the sum of squared deviations from the arithmetic mean of a list of numbers. Fails if the list is empty.

Compilation flags:
```
static
```

Template:
```
sum_of_squares(List,Sum)
```
Mode and number of proofs:
```
sum_of_squares(+list(number),-float) - zero_or_one
```

---

central_moment/3

Calculates the K-th central moment of a list of numbers. The K-th central moment is the mean of the deviations from the mean raised to the power K (with `K > 0`). Fails if the list is empty.

Compilation flags:

```
static
```

Template:

```
central_moment(K,List,Moment)
```

Mode and number of proofs:

```
central_moment(+positive_integer,+list(number),-float) - zero_or_one
```

---

min_max_normalization/2

Normalizes a list of numbers to the interval `[0.0, 1.0]` using min-max normalization. Fails if the list is empty or if all values are equal.

Compilation flags:

```
static
```

Template:

```
min_max_normalization(List,NormalizedList)
```

Mode and number of proofs:

```
min_max_normalization(+list(number),-list(float)) - zero_or_one
```

---

frequency_distribution/2

Computes the frequency distribution of a list of numbers, returning a list of `Value-Count` pairs in ascending order of value. Fails if the list is empty.

Compilation flags:

```
static
```

Template:

```
frequency_distribution(List,Distribution)
```

Mode and number of proofs:

```
frequency_distribution(+list(number),-list(pair(number,integer))) - zero_or_one
```

---

standard_error/2

Calculates the standard error of the mean of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`standard_error(List,Error)`
Mode and number of proofs:
`standard_error(+list(number),-float)` - `zero_or_one`

---

mean_squared_error/3

Calculates the mean squared error between two lists of numbers. Fails if the lists are empty or have different lengths.

Compilation flags:
`static`

Template:
`mean_squared_error(List1,List2,Error)`
Mode and number of proofs:
`mean_squared_error(+list(number),+list(number),-float)` - `zero_or_one`

---

root_mean_squared_error/3

Calculates the root mean squared error between two lists of numbers. Fails if the lists are empty or have different lengths.

Compilation flags:
`static`

Template:
`root_mean_squared_error(List1,List2,Error)`
Mode and number of proofs:
`root_mean_squared_error(+list(number),+list(number),-float)` - `zero_or_one`

`valid/1`

Term is a closed list of numbers.

Compilation flags:
`static`

Template:
`valid(Term)`
Mode and number of proofs:
`valid(@nonvar)` - `zero_or_one`

Protected predicates

1.308 stemming

object

1.308.1 `lovins_stemmer(Representation)`

- `Representation` - Word representation. Valid values are `atom`, `codes`, and `chars`.

Lovins stemmer algorithm implementation for English words.

Availability:
`logtalk_load(stemming(loader))`

Author: Paulo Moura
Version: 1:0:1
Date: 2026-10-20

Compilation flags:
`static, context_switching_calls`

Implements:

`public` *stemmer_protocol*

Uses:

list

Remarks:

- Algorithm: The Lovins stemming algorithm (Lovins, 1968) removes the longest suffix from a word using a list of 294 endings, each associated with a condition for removal. It then applies transformation rules to fix spelling.
- Reference: Lovins, J.B. (1968). Development of a stemming algorithm. Mechanical Translation and Computational Linguistics, 11(1-2), 22-31.

Inherited public predicates:

object

1.308.2 `porter_stemmer(Representation)`

- `Representation` - Word representation. Valid values are `atom`, `codes`, and `chars`.

Porter stemmer algorithm implementation for English words.

Availability:

`logtalk_load(stemming(loader))`

Author: Paulo Moura

Version: 1:0:0
Date: 2026-02-05

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *stemmer_protocol*

Uses:
integer
list

Remarks:

- Algorithm: The Porter stemming algorithm (Porter, 1980) is a widely used algorithm for reducing English words to their root form by applying a series of rules that remove common suffixes.
- Reference: Porter, M.F. (1980). An algorithm for suffix stripping. Program, 14(3), 130-137.

1.309 stomp

object

1.309.1 stomp

Portable STOMP 1.2 (Simple Text Orientated Messaging Protocol) client. Uses the sockets library for TCP communication.

Availability:
```
logtalk_load(stomp(loader))
```

Author: Paulo Moura
Version: 1:2:0
Date: 2026-11-06

Compilation flags:
```
static, context_switching_calls
```

Imports:
```
public options
```

Uses:

list
socket
term_io
user
uuid(Representation)

Remarks:

- Supported backends: ECLiPSe, GNU Prolog, SICStus Prolog, Shumway Prolog, and SWI-Prolog (same as the sockets library).
- Protocol version: Implements STOMP 1.2 specification.
- Heartbeat: Supports heartbeat negotiation. Automatic heartbeat sending is not implemented; use send_heartbeat/1 manually if needed.
- Subscriptions: Supports multiple concurrent subscriptions with unique IDs.
- Transactions: Supports STOMP transactions with BEGIN, COMMIT, and ABORT.
- Frame encoding: Properly encodes/decodes header values according to STOMP 1.2 escaping rules.

Inherited public predicates:

check_option/1 *check_options/1* *default_option/1* *default_options/1* *option/2* *option/3* *valid_option/1* *valid_options/1*

- *Public predicates*

  - *frame_body/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

connect/4

Connects to a STOMP server and performs the STOMP handshake. Returns a connection handle for subsequent operations.

Compilation flags:

```
static
```

Template:

```
connect(Host,Port,Connection,Options)
```

Mode and number of proofs:

```
connect(+atom,+integer,--compound,+list) - one_or_error
```

Exceptions:

Connection refused or network error:

```
stomp_error(connection_failed)
```

Server rejected connection:

```
stomp_error(protocol_error(Message))
```

Remarks:

- Option login(Login): Username for authentication.
- Option passcode(Passcode): Password for authentication.
- Option host(VirtualHost): Virtual host name. Defaults to the Host parameter.
- Option heartbeat(ClientMs, ServerMs): Heartbeat timing in milliseconds. Default is 0,0 (no heartbeat).

---

disconnect/2

Gracefully disconnects from the STOMP server. Sends DISCONNECT frame and waits for RECEIPT if requested.

Compilation flags:

```
static
```

Template:

```
disconnect(Connection,Options)
```

Mode and number of proofs:

```
disconnect(+compound,+list) - one_or_error
```

Exceptions:

`Connection` is not a valid STOMP connection handle:

```
error
```

Remarks:

- Option receipt(ReceiptId): Request receipt confirmation. Automatically generated if not specified.

---

connection_alive/1

Checks if the connection is still open and valid.

Compilation flags:
`static`

Template:
`connection_alive(Connection)`
Mode and number of proofs:
`connection_alive(+compound)` - `zero_or_one`

---

send/4

Sends a message to the specified destination.

Compilation flags:
`static`

Template:
`send(Connection,Destination,Body,Options)`
Mode and number of proofs:
`send(+compound,+atom,+term,+list)` - `one_or_error`

Exceptions:
`Connection` is invalid, `Body` cannot be encoded, or the SEND frame cannot be transmitted:
`stomp_error(error)`

Remarks:

- Option content_type(MimeType): MIME type of the body.
- Option content_length(Length): Body length in bytes. Auto-calculated if omitted for atom/string bodies.
- Option transaction(TransactionId): Include message in the named transaction.
- Option receipt(ReceiptId): Request receipt confirmation.
- Option header(Name, Value): Add custom header (can be repeated).

---

subscribe/4

Subscribes to a destination to receive messages.

Compilation flags:
`static`

Template:
`subscribe(Connection,Destination,SubscriptionId,Options)`
Mode and number of proofs:

`subscribe(+compound,+atom,+atom,+list)` - `one_or_error`

Exceptions:

`Connection` is invalid, the acknowledgment mode is unsupported, or the SUBSCRIBE frame cannot be transmitted:

`stomp_error(error)`

Remarks:

- Option ack(Mode): Acknowledgment mode: auto (default), client, or client_individual.

---

unsubscribe/3

Unsubscribes from a destination.

Compilation flags:

`static`

Template:

`unsubscribe(Connection,SubscriptionId,Options)`

Mode and number of proofs:

`unsubscribe(+compound,+atom,+list)` - `one_or_error`

Exceptions:

`Connection` is invalid or the UNSUBSCRIBE frame cannot be transmitted:

`stomp_error(error)`

---

receive/3

Receives a frame from the server. Returns MESSAGE, RECEIPT, or ERROR frames.

Compilation flags:

`static`

Template:

`receive(Connection,Frame,Options)`

Mode and number of proofs:

`receive(+compound,-compound,+list)` - `zero_or_one_or_error`

Exceptions:

`Connection` is invalid or the input stream does not contain a valid STOMP frame within the requested timeout:

`error`

Remarks:

- Option timeout(Milliseconds): Timeout in milliseconds. 0 for non-blocking, -1 for infinite wait. Default is -1.

---

ack/3

Acknowledges receipt of a message.

Compilation flags:
`static`

Template:
`ack(Connection,AckId,Options)`
Mode and number of proofs:
`ack(+compound,+atom,+list)` - `one_or_error`

Exceptions:
`Connection` is invalid or the ACK frame cannot be transmitted:
`stomp_error(error)`

Remarks:

- Option transaction(TransactionId): Include acknowledgment in the named transaction.

---

nack/3

Negatively acknowledges a message (tells server the message was not consumed).

Compilation flags:
`static`

Template:
`nack(Connection,AckId,Options)`
Mode and number of proofs:
`nack(+compound,+atom,+list)` - `one_or_error`

Exceptions:
`Connection` is invalid or the NACK frame cannot be transmitted:
`stomp_error(error)`

Remarks:

- Option transaction(TransactionId): Include negative acknowledgment in the named transaction.

---

begin_transaction/3

Begins a new transaction.

Compilation flags:
`static`

Template:
`begin_transaction(Connection,TransactionId,Options)`
Mode and number of proofs:
`begin_transaction(+compound,+atom,+list)` - `one_or_error`

Exceptions:
`Connection` is invalid or the BEGIN frame cannot be transmitted:
`stomp_error(error)`

---

commit_transaction/3

Commits a transaction, making all its operations permanent.

Compilation flags:
`static`

Template:
`commit_transaction(Connection,TransactionId,Options)`
Mode and number of proofs:
`commit_transaction(+compound,+atom,+list)` - `one_or_error`

Exceptions:
`Connection` is invalid or the COMMIT frame cannot be transmitted:
`stomp_error(error)`

---

abort_transaction/3

Aborts a transaction, rolling back all its operations.

Compilation flags:
`static`

Template:
`abort_transaction(Connection,TransactionId,Options)`
Mode and number of proofs:
`abort_transaction(+compound,+atom,+list)` - `one_or_error`

Exceptions:

`Connection` is invalid or the ABORT frame cannot be transmitted:
`stomp_error(error)`

---

send_heartbeat/1

Sends a heartbeat (EOL) to the server to keep the connection alive.

Compilation flags:
`static`

Template:
`send_heartbeat(Connection)`
Mode and number of proofs:
`send_heartbeat(+compound)` - `one_or_error`

Exceptions:
`Connection` is invalid or the heartbeat cannot be written to the output stream:
`stomp_error(error)`

---

frame_command/2

Extracts the command from a frame.

Compilation flags:
`static`

Template:
`frame_command(Frame,Command)`
Mode and number of proofs:
`frame_command(+compound,-atom)` - `one`

---

frame_header/3

Extracts a header value from a frame. Fails if header is not present.

Compilation flags:
`static`

Template:
`frame_header(Frame,HeaderName,Value)`
Mode and number of proofs:
`frame_header(+compound,+atom,-atom)` - `zero_or_one`

---

frame_headers/2

Extracts all headers from a frame as a list of Name-Value pairs.

Compilation flags:
```
static
```

Template:
```
frame_headers(Frame,Headers)
```
Mode and number of proofs:
```
frame_headers(+compound,-list) - one
```

---

frame_body/2

Extracts the body from a frame. Returns empty atom if no body.

Compilation flags:
```
static
```

Template:
```
frame_body(Frame,Body)
```
Mode and number of proofs:
```
frame_body(+compound,-term) - one
```

1.310 stop_words

object

1.310.1 stop_words(Representation,Language)

- `Representation` - Word representation. Valid values are `atom`, `codes`, and `chars`.
- `Language` - Object implementing the `stop_words_language_protocol` protocol.

Stop-word enumeration and filtering for a text representation and language provider.

Availability:

Public predicates

levenshtein/3

Computes the Levenshtein distance between two strings.

Compilation flags:

`static`

Template:

`levenshtein(String1,String2,Distance)`

`String1` - First input string.

`String2` - Second input string.

`Distance` - Minimum number of single-character edits (insertions, deletions, substitutions) to transform `String1` into `String2`.

Mode and number of proofs:

`levenshtein(+text,+text,-integer)` - `one`

damerau_levenshtein/3

Computes the Damerau-Levenshtein distance between two strings.

Compilation flags:

`static`

Template:

`damerau_levenshtein(String1,String2,Distance)`

`String1` - First input string.

`String2` - Second input string.

`Distance` - Minimum number of edits (insertions, deletions, substitutions, and adjacent transpositions) to transform `String1` into `String2`.

Mode and number of proofs:

`damerau_levenshtein(+text,+text,-integer)` - `one`

---

hamming/3

Computes the Hamming distance between two strings of equal length. Fails if the strings differ in length.

Compilation flags:

`static`

Template:

`hamming(String1,String2,Distance)`

`String1` - First input string.

`String2` - Second input string (must have the same length as `String1`).

`Distance` - Number of positions at which the corresponding characters differ.

Mode and number of proofs:

`hamming(+text,+text,-integer)` - `zero_or_one`

---

jaro/3

Computes the Jaro similarity score between two strings.

Compilation flags:

`static`

Template:

`jaro(String1,String2,Similarity)`

`String1` - First input string.

`String2` - Second input string.

`Similarity` - A value between 0.0 (completely different) and 1.0 (identical), based on matching characters and transpositions.

Mode and number of proofs:

`jaro(+text,+text,-float)` - `one`

---

jaro_winkler/3

Computes the Jaro-Winkler similarity score between two strings.

Compilation flags:
`static`

Template:
`jaro_winkler(String1,String2,Similarity)`
`String1` - First input string.
`String2` - Second input string.
`Similarity` - A value between 0.0 and 1.0. Extends Jaro similarity with a prefix bonus: strings sharing a common prefix are scored higher.

Mode and number of proofs:
`jaro_winkler(+text,+text,-float)` - `one`

---

edit_similarity/3

Computes the edit similarity score between two strings using Levenshtein distance.

Compilation flags:
`static`

Template:
`edit_similarity(String1,String2,Similarity)`
`String1` - First input string.
`String2` - Second input string.
`Similarity` - A value between 0.0 and 1.0 computed as 1 - (edit distance / max length of the two strings).

Mode and number of proofs:
`edit_similarity(+text,+text,-float)` - `one`

---

edit_similarity/4

Computes the edit similarity score between two strings using the given algorithm.

Compilation flags:
`static`

Template:
`edit_similarity(Algorithm,String1,String2,Similarity)`

`Algorithm` - Edit distance algorithm. Valid values are `levenshtein`, `damerau_levenshtein`, `hamming`, and `longest_common_subsequence`.
`String1` - First input string.
`String2` - Second input string.
`Similarity` - A value between 0.0 and 1.0 computed as 1 - (edit distance / max length of the two strings).

Mode and number of proofs:

`edit_similarity(+atom,+text,+text,-float)` - `one`

`longest_common_subsequence_length/3`

Computes the length of the Longest Common Subsequence between two strings.

Compilation flags:

`static`

Template:

`longest_common_subsequence_length(String1,String2,Length)`
`String1` - First input string.
`String2` - Second input string.
`Length` - Length of the longest subsequence common to both strings (characters need not be contiguous).

Mode and number of proofs:

`longest_common_subsequence_length(+text,+text,-integer)` - `one`

`longest_common_subsequence/3`

Computes the Longest Common Subsequence itself between two strings.

Compilation flags:

`static`

Template:

`longest_common_subsequence(String1,String2,Subsequence)`
`String1` - First input string.
`String2` - Second input string.
`Subsequence` - The longest subsequence common to both strings (characters need not be contiguous). If multiple exist, one is returned nondeterministically.

Mode and number of proofs:

`longest_common_subsequence(+text,+text,-atom)` - `one`

---

longest_common_substring/3

Computes the longest contiguous common substring between two strings.

Compilation flags:
`static`

Template:
`longest_common_substring(String1,String2,Substring)`
`String1` - First input string.
`String2` - Second input string.
`Substring` - The longest contiguous substring shared by both strings. If multiple exist, one is returned nondeterministically.

Mode and number of proofs:
`longest_common_substring(+text,+text,-atom)` - `one`

---

cosine_similarity/3

Computes the cosine similarity between two token lists.

Compilation flags:
`static`

Template:
`cosine_similarity(Tokens1,Tokens2,Similarity)`
`Tokens1` - First token list (e.g., list of words or character n-grams).
`Tokens2` - Second token list.
`Similarity` - A value between 0.0 and 1.0 representing the cosine of the angle between the two token vectors.

Mode and number of proofs:
`cosine_similarity(+list(text),+list(text),-float)` - `one`

---

jaccard_index/3

Computes the Jaccard index (similarity) between two token lists.

Compilation flags:
`static`

Template:
`jaccard_index(Tokens1,Tokens2,Index)`
`Tokens1` - First token list (e.g., list of words or character n-grams).
`Tokens2` - Second token list.
`Index` - A value between 0.0 (no overlap) and 1.0 (identical sets), computed as `|intersection| / |union|`.

Mode and number of proofs:
`jaccard_index(+list(text),+list(text),-float)` - `one`

---

soundex/2

Computes the Soundex phonetic encoding for a string.

Compilation flags:
`static`

Template:
`soundex(String,Encoding)`
`String` - Input string (typically a name).
`Encoding` - A four-character Soundex code representing the phonetic encoding.

Mode and number of proofs:
`soundex(+text,-atom)` - `one`

---

soundex_match/2

Succeeds if two strings share the same Soundex code.

Compilation flags:
`static`

Template:
`soundex_match(String1,String2)`
`String1` - First input string.
`String2` - Second input string.

Mode and number of proofs:
`soundex_match(+text,+text)` - `one`

---

nysiis/2

Computes the NYSIIS phonetic key for a string.

Compilation flags:
`static`

Template:
`nysiis(String,Encoding)`
`String` - Input string (typically a name).
`Encoding` - The NYSIIS phonetic encoding, limited to six characters.

Mode and number of proofs:
`nysiis(+text,-atom)` - `one`

---

nysiis_match/2

Succeeds if two strings share the same NYSIIS key.

Compilation flags:
`static`

Template:
`nysiis_match(String1,String2)`
`String1` - First input string.
`String2` - Second input string.

Mode and number of proofs:
`nysiis_match(+text,+text)` - `zero_or_one`

---

metaphone/2

Computes the Metaphone phonetic key for a string.

Compilation flags:
`static`

Template:
`metaphone(String,Encoding)`
`String` - Input string (typically a name).
`Encoding` - The Metaphone phonetic encoding, a more accurate phonetic encoding than Soundex.

Mode and number of proofs:
`metaphone(+text,-atom)` - `one`

---

metaphone_match/2

Succeeds if two strings share the same Metaphone key.

Compilation flags:
`static`

Template:
`metaphone_match(String1,String2)`
`String1` - First input string.
`String2` - Second input string.

Mode and number of proofs:
`metaphone_match(+text,+text)` - `one`

---

double_metaphone/3

Computes the Double Metaphone encoding of a text, returning both primary and alternative encodings.

Compilation flags:

`static`

Template:

`double_metaphone(Text,Primary,Alternative)`

`Text` - Input string (typically a name).

`Primary` - Primary Double Metaphone encoding.

`Alternative` - Alternative Double Metaphone encoding.

Mode and number of proofs:

`double_metaphone(+text,-atom,-atom)` - `one`

---

double_metaphone_match/2

Succeeds if the Double Metaphone encodings of two texts match (either primary or alternative encodings).

Compilation flags:

`static`

Template:

`double_metaphone_match(String1,String2)`

`String1` - First input string.

`String2` - Second input string.

Mode and number of proofs:

`double_metaphone_match(+text,+text)` - `zero_or_one`

---

caverphone/2

Computes the Caverphone 2.0 phonetic encoding of a text.

Compilation flags:

`static`

Template:

`caverphone(Text,Encoding)`

`Text` - Input string (typically a name).

`Encoding` - The Caverphone 2.0 phonetic encoding, limited to ten characters.

Mode and number of proofs:

`caverphone(+text,-atom)` - `one`

---

caverphone_match/2

Succeeds if two strings share the same Caverphone 2.0 key.

Compilation flags:
`static`

Template:
`caverphone_match(String1,String2)`
`String1` - First input string.
`String2` - Second input string.

Mode and number of proofs:
`caverphone_match(+text,+text)` - `zero_or_one`

Public predicates

atom_string/2

Converts between an atom and a string.

Compilation flags:
`static`

Template:
`atom_string(Atom,String)`

Mode and number of proofs:
`atom_string(+atom,?text)` - `zero_or_one`
`atom_string(-atom,+text)` - `zero_or_one`

number_string/2

Converts between a number and a string. Fails if the string does not represent a valid number.

Compilation flags:
```
static
```

Template:
```
number_string(Number,String)
```
Mode and number of proofs:
```
number_string(+number,?text) - zero_or_one
number_string(-number,+text) - zero_or_one
```

---

string_chars/2

Converts between a string and a list of characters.

Compilation flags:
```
static
```

Template:
```
string_chars(String,Chars)
```
Mode and number of proofs:
```
string_chars(+text,?list(character)) - zero_or_one
string_chars(-text,+list(character)) - zero_or_one
```

---

string_codes/2

Converts between a string and a list of character codes.

Compilation flags:
```
static
```

Template:
```
string_codes(String,Codes)
```
Mode and number of proofs:
```
string_codes(+text,?list(character_code)) - zero_or_one
string_codes(-text,+list(character_code)) - zero_or_one
```

---

string_concat/3

Concatenates two strings.

Compilation flags:
`static`

Template:
`string_concat(String1,String2,String3)`
Mode and number of proofs:
`string_concat(+text,+text,?text)` - `zero_or_one`
`string_concat(?text,?text,+text)` - `zero_or_more`

---

string_length/2

Returns the length of a string.

Compilation flags:
`static`

Template:
`string_length(String,Length)`
Mode and number of proofs:
`string_length(+text,?integer)` - `zero_or_one`

---

sub_string/5

Extracts a substring from a string.

Compilation flags:
`static`

Template:
`sub_string(String,Before,Length,After,SubString)`
Mode and number of proofs:
`sub_string(+text,?integer,?integer,?integer,?text)` - `zero_or_more`

---

string_upper/2

Converts a string to uppercase (ASCII only).

Compilation flags:
`static`

Template:
`string_upper(String,UpperString)`
Mode and number of proofs:
`string_upper(+text,?text)` - `zero_or_one`

---

string_lower/2

Converts a string to lowercase (ASCII only).

Compilation flags:
`static`

Template:
`string_lower(String,LowerString)`
Mode and number of proofs:
`string_lower(+text,?text)` - `zero_or_one`

---

split_string/4

Decomposes `String` into `SubStrings` according to separators `SepChars` and padding characters `PadChars`. The string is split at the separators, and any padding characters around the resulting sub-strings are removed. Characters in both `SepChars` and `PadChars` are treated as separators where sequences count as one separator, and are ignored at string boundaries.

Compilation flags:
`static`

Template:
`split_string(String,SepChars,PadChars,SubStrings)`
Mode and number of proofs:
`split_string(+text,+text,+text,-list(text))` - `one`

---

atomics_to_string/2

Concatenates the atomic terms in `List` into `String`. The list may contain numbers, atoms, and strings (in the current representation).

Compilation flags:
`static`

Template:
`atomics_to_string(List,String)`
Mode and number of proofs:
`atomics_to_string(++list(atomic),-text)` - `one`

---

atomics_to_string/3

Concatenates the atomic terms in `List` into `String`, with `Separator` inserted between each element. The list may contain numbers, atoms, and strings (in the current representation).

Compilation flags:
`static`

Template:
`atomics_to_string(List,Separator,String)`
Mode and number of proofs:
`atomics_to_string(++list(atomic),+text,-text)` - `one`

---

trim/2

Trims string by deleting all leading and trailing whitespace.

Compilation flags:
`static`

Template:
`trim(String,Trimmed)`
Mode and number of proofs:
`trim(+text,-text)` - `one`

---

trim/3

Trims string by deleting all occurrences of the characters in `Elements` from the beginning and end of the string.

Compilation flags:
`static`

Template:
`trim(String,Elements,Trimmed)`
Mode and number of proofs:
`trim(+text,+text,-text)` - `one`

---

trim_left/2

Trims string by deleting all leading whitespace.

Compilation flags:
`static`

Template:
`trim_left(String,Trimmed)`
Mode and number of proofs:
`trim_left(+text,-text)` - `one`

---

trim_left/3

Trims string by deleting all occurrences of the characters in `Elements` from the beginning of the string.

Compilation flags:
`static`

Template:
`trim_left(String,Elements,Trimmed)`
Mode and number of proofs:
`trim_left(+text,+text,-text)` - `one`

---

trim_right/2

Trims string by deleting all trailing whitespace.

Compilation flags:
`static`

Template:
`trim_right(String,Trimmed)`
Mode and number of proofs:
`trim_right(+text,-text)` - `one`

---

trim_right/3

Trims string by deleting all occurrences of the characters in `Elements` from the end of the string.

Compilation flags:
`static`

Template:
`trim_right(String,Elements,Trimmed)`
Mode and number of proofs:
`trim_right(+text,+text,-text)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

Dependencies:

(none)

Remarks:

- Generation operations: Predicates for generating all subsequences or variants thereof.
- Ordering variants: Predicates that support an additional Order argument (default, lexicographic, or shortlex) for controlling output order.
- Searching and matching: Predicates for finding specific subsequences with desired properties.
- Prefix and suffix operations: Predicates for checking and finding prefixes and suffixes.
- Contiguous subsequences: Predicates for working with contiguous subsequences (subslices, sliding windows).
- Random selection: Predicates for randomly selecting subsequences.
- Constrained operations: Predicates for generating subsequences with specific constraints.
- Utility predicates: Helper predicates for subsequence operations.

Public predicates

subsequences/2

Generates all subsequences of a list using default order. A subsequence maintains the relative order of elements but need not be contiguous. The empty list is included.

Compilation flags:

```
static
```

Template:

```
subsequences(List,Subsequences)
```

Mode and number of proofs:

```
subsequences(+list,-list) - one
```

Examples:

All subsequences

```
subsequences([a,b,c],Subsequences)
Subsequences=[[],[a],[b],[a,b],[c],[a,c],[b,c],[a,b,c]]
```

---

subsequence/2

True iff the second argument is a subsequence of the first argument. Subsequences of a list using default order. A subsequence maintains the relative order of elements but need not be contiguous. The empty list is included.

Compilation flags:

```
static
```

Template:

```
subsequence(List,Subsequence)
```

Mode and number of proofs:

```
subsequence(+list,-list) - one_or_more
```

Examples:

A subsequence

```
subsequence([1,2],Subsequence)
Subsequence=[]
```

---

subsequences/3

Generates all subsequences of a list with specified ordering: `default` (as naturally produced), `lexicographic`, or `shortlex` (by length first, then lexicographically).

Compilation flags:
`static`

Template:
`subsequences(List,Order,Subsequences)`
Mode and number of proofs:
`subsequences(+list,+atom,-list)` - `one`

Examples:
Shortlex order
```
subsequences([a,b],shortlex,Subsequences)
Subsequences=[[],[a],[b],[a,b]]
```

---

subsequence/3

True iff the third argument is a subsequence of the first argument with specified ordering: `default` (as naturally produced), `lexicographic`, or `shortlex` (by length first, then lexicographically).

Compilation flags:
`static`

Template:
`subsequence(List,Order,Subsequence)`
Mode and number of proofs:
`subsequence(+list,+atom,-list)` - `one_or_more`

Examples:
Shortlex order
```
subsequence([a,b],shortlex,Subsequence)
Subsequence=[]
```

---

nonempty_subsequences/2

Generates all non-empty subsequences of a list.

Compilation flags:
`static`

Template:
`nonempty_subsequences(List,Subsequences)`

Mode and number of proofs:

```
nonempty_subsequences(+list,-list) - one
```

Examples:

Non-empty subsequences

```
nonempty_subsequences([a,b],Subsequences)
Subsequences=[[a],[b],[a,b]]
```

---

nonempty_subsequence/2

True iff the second argument is a non-empty subsequence of the first argument.

Compilation flags:

```
static
```

Template:

```
nonempty_subsequence(List,Subsequence)
```

Mode and number of proofs:

```
nonempty_subsequence(+list,-list) - one_or_more
```

Examples:

Non-empty subsequence

```
nonempty_subsequence([a,b],Subsequence)
Subsequence=[a]
```

---

power_set/2

Generates the power set of a list (all possible subsequences). Alias for subsequences/2 when first argument is ground.

Compilation flags:

```
static
```

Template:

```
power_set(List,PowerSet)
```

Mode and number of proofs:

```
power_set(+list,-list) - one
```

Examples:

Power set

```
power_set([a,b],PowerSet)
PowerSet=[[],[a],[b],[a,b]]
```

---

inits/2

Generates all initial segments (prefixes) of a list, shortest first. Includes the empty list.

Compilation flags:
```
static
```

Template:
```
inits(List,Inits)
```
Mode and number of proofs:
```
inits(+list,-list) - one
```

Examples:
All prefixes
```
inits([a,b,c],Inits)
Inits=[[],[a],[a,b],[a,b,c]]
```

---

init/2

True iff the second argument is one of the initial segments (prefixes) of a list.

Compilation flags:
```
static
```

Template:
```
init(List,Inits)
```
Mode and number of proofs:
```
init(+list,-term) - zero_or_more
init(+list,+term) - zero_or_one
```

Examples:
Check prefix
```
init([a,b,c],[a,b])
true
```

---

tails/2

Generates all final segments (suffixes) of a list, longest first. Includes the empty list.

Compilation flags:
```
static
```

Template:
```
tails(List,Tails)
```
Mode and number of proofs:

```
tails(+list,-list) - one
```

Examples:

All suffixes

```
tails([a,b,c],Tails)
Tails=[[a,b,c],[b,c],[c],[]]
```

---

tail/2

True iff the second argument is one of the final segments (suffixes) of a list.

Compilation flags:

```
static
```

Template:

```
tail(List,Tails)
```

Mode and number of proofs:

```
tail(+list,-term) - zero_or_more
tail(+list,+term) - zero_or_one
```

Examples:

Check suffix

```
tail([a,b,c],[b,c])
true
```

---

inits1/2

Generates all non-empty initial segments (prefixes) of a list, shortest first.

Compilation flags:

```
static
```

Template:

```
inits1(List,Inits)
```

Mode and number of proofs:

```
inits1(+list,-list) - one
```

Examples:

Non-empty prefixes

```
inits1([a,b,c],Inits)
Inits=[[a],[a,b],[a,b,c]]
```

---

init1/2

True iff the second argument is a non-empty initial segment (prefix) of a list, shortest first.

Compilation flags:
`static`

Template:
`init1(List,Init)`
Mode and number of proofs:
`init1(+list,-term)` - `one_or_more`

Examples:
Non-empty prefix
```
init1([a,b,c],Init)
Init=[a]
```

---

tails1/2

Generates all non-empty final segments (suffixes) of a list, longest first.

Compilation flags:
`static`

Template:
`tails1(List,Tails)`
Mode and number of proofs:
`tails1(+list,-list)` - `one`

Examples:
Non-empty suffix
```
tails1([a,b,c],Tails)
Tails=[[a,b,c],[b,c],[c]]
```

---

tail1/2

True iff the second argument is a non-empty final segment (suffix) of a list, longest first.

Compilation flags:
`static`

Template:
`tail1(List,Tail)`
Mode and number of proofs:
`tail1(+list,-list)` - `one`

Examples:

Non-empty suffix

```
tail1([a,b,c],Tail)
Tail=[a,b,c]
```

---

init_tails/2

Generates all pairs of initial and final segments. Each pair Init-Tail represents a split of the list where Init+Tail equals the original list. When the second argument is bound, checks if it is a valid split.

Compilation flags:

```
static
```

Template:

```
init_tails(List,InitTailPairs)
```

Mode and number of proofs:

```
init_tails(+list,-list) - one
```

Examples:

All splits

```
init_tails([a,b],InitTailPairs)
InitTailPairs=['-'([],[a,b]),'-'([a],[b]),'-'([a,b],[])]
```

---

init_tail/2

True iff (Init,Tail) represents a split of the list where Init+Tail equals the original list.

Compilation flags:

```
static
```

Template:

```
init_tail(List,InitTailPairs)
```

Mode and number of proofs:

```
init_tail(+list,-term) - one_or_more
```

Examples:

Check split

```
init_tail([a,b,c],'-'([a],[b,c]))
true
```

---

longest_common_subsequence/3

Finds the longest common subsequence (LCS) between two lists. Uses dynamic programming.

Compilation flags:
```
static
```

Template:
```
longest_common_subsequence(List1,List2,LCS)
```
Mode and number of proofs:
```
longest_common_subsequence(+list,+list,-list) - one
```

Examples:
LCS example
```
longest_common_subsequence([a,b,c,d,e],[a,c,e,f],LCS)
LCS=[a,c,e]
```

---

longest_increasing_subsequence/2

Finds the longest strictly increasing subsequence in a list. Elements must be comparable.

Compilation flags:
```
static
```

Template:
```
longest_increasing_subsequence(List,LIS)
```
Mode and number of proofs:
```
longest_increasing_subsequence(+list,-list) - one
```

Examples:
LIS example
```
longest_increasing_subsequence([3,1,4,1,5,9,2,6],LIS)
LIS=[1,4,5,9]
```

---

longest_decreasing_subsequence/2

Finds the longest strictly decreasing subsequence in a list. Elements must be comparable.

Compilation flags:
```
static
```

Template:
```
longest_decreasing_subsequence(List,LDS)
```
Mode and number of proofs:
```
longest_decreasing_subsequence(+list,-list) - one
```

Examples:

LDS example

```
longest_decreasing_subsequence([9,5,2,8,3,1],LDS)
LDS=[9,5,2,1]
```

---

longest_common_increasing_subsequence/3

Finds the longest subsequence that is both common to two lists and strictly increasing.

Compilation flags:

```
static
```

Template:

```
longest_common_increasing_subsequence(List1,List2,LCIS)
```

Mode and number of proofs:

```
longest_common_increasing_subsequence(+list,+list,-list) - one
```

Examples:

LCIS example

```
longest_common_increasing_subsequence([1,4,2,5],[4,1,3,5],LCIS)
LCIS=[1,5]
```

---

longest_repeating_subsequence/2

Finds the longest subsequence that appears at least twice in the list (at different positions).

Compilation flags:

```
static
```

Template:

```
longest_repeating_subsequence(List,LRS)
```

Mode and number of proofs:

```
longest_repeating_subsequence(+list,-list) - one
```

Examples:

LRS example

```
longest_repeating_subsequence([a,a,b,a,b],LRS)
LRS=[a,b]
```

---

is_subsequence_of/2

Checks if the first list is a subsequence of the second list. All elements must occur in order.

Compilation flags:

```
static
```

Template:

```
is_subsequence_of(Subsequence,List)
```

Mode and number of proofs:

```
is_subsequence_of(+list,+list) - zero_or_one
```

Examples:

Valid subsequence

```
is_subsequence_of([a,c],[a,b,c])
true
```

Invalid subsequence

```
is_subsequence_of([c,a],[a,b,c])
false
```

---

proper_subsequence/2

Checks if the first list is a proper subsequence of the second list (i.e., subsequence and not equal).

Compilation flags:

```
static
```

Template:

```
proper_subsequence(Subsequence,List)
```

Mode and number of proofs:

```
proper_subsequence(+list,+list) - zero_or_one
```

Examples:

Proper subsequence

```
proper_subsequence([a,c],[a,b,c])
true
```

Not proper (equal lists)

```
proper_subsequence([a,b,c],[a,b,c])
false
```

---

subsequence_at_indices/3

Extracts a subsequence using a strictly increasing list of 1-based indices.

Compilation flags:
`static`

Template:
`subsequence_at_indices(List,Indices,Subsequence)`
Mode and number of proofs:
`subsequence_at_indices(+list,+list,-list)` - `zero_or_one`

Examples:
Indices selection
```
subsequence_at_indices([a,b,c,d],[1,3],Subsequence)
Subsequence=[a,c]
```

---

common_subsequences/3

Generates all subsequences that are common to both lists.

Compilation flags:
`static`

Template:
`common_subsequences(List1,List2,CommonSubsequences)`
Mode and number of proofs:
`common_subsequences(+list,+list,-list)` - `one`

Examples:
All common subsequences
```
common_subsequences([a,b,c],[a,c,d],CommonSubsequences)
CommonSubsequences=[[a,c],[a],[c],[]]
```

---

common_subsequence/3

True iff the third argument is a common subsequence of both lists.

Compilation flags:
`static`

Template:
`common_subsequence(List1,List2,CommonSubsequence)`
Mode and number of proofs:
`common_subsequence(+list,+list,-list)` - `one_or_more`

Examples:

Check common subsequence

```
common_subsequence([a,b,c],[a,c,d],[a,c])
true
```

---

count_distinct_subsequences/3

Counts the number of distinct occurrences of a pattern as a subsequence in a list.

Compilation flags:

```
static
```

Template:

```
count_distinct_subsequences(Pattern,List,Count)
```

Mode and number of proofs:

```
count_distinct_subsequences(+list,+list,-integer) - one
```

Examples:

Count occurrences

```
count_distinct_subsequences([a,b],[a,a,b,b],Count)
Count=4
```

---

is_prefix_of/2

Checks if the first list is a prefix of the second list.

Compilation flags:

```
static
```

Template:

```
is_prefix_of(Prefix,List)
```

Mode and number of proofs:

```
is_prefix_of(+list,+list) - zero_or_one
```

Examples:

Valid prefix

```
is_prefix_of([a,b],[a,b,c])
true
```

Invalid prefix

```
is_prefix_of([b,c],[a,b,c])
false
```

---

is_suffix_of/2

Checks if the first list is a suffix of the second list.

Compilation flags:

```
static
```

Template:

```
is_suffix_of(Suffix,List)
```

Mode and number of proofs:

```
is_suffix_of(+list,+list) - zero_or_one
```

Examples:

Valid suffix

```
is_suffix_of([b,c],[a,b,c])
true
```

Invalid suffix

```
is_suffix_of([a,b],[a,b,c])
false
```

---

subslices/2

Generates all contiguous non-empty subslices (sublists) of a list.

Compilation flags:

```
static
```

Template:

```
subslices(List,Subslice)
```

Mode and number of proofs:

```
subslices(+list,-list) - one
subslices(+list,?list) - zero_or_more
```

Examples:

All subslices

```
subslices([a,b,c],Subslice)
Subslice=[[a],[a,b],[a,b,c],[b],[b,c],[c]]
```

---

sliding_window/3

Generates all contiguous windows of size N from a list. Fails if N is larger than the list length.

Compilation flags:
```
static
```

Template:
```
sliding_window(N,List,Window)
```
Mode and number of proofs:
```
sliding_window(+integer,+list,-list) - one
sliding_window(+integer,+list,?list) - zero_or_more
```

Examples:

Windows of size 2
```
sliding_window(2,[a,b,c,d],Window)
Window=[[a,b],[b,c],[c,d]]
```

---

random_subsequence/2

Randomly selects one subsequence uniformly from all 2^N possible subsequences.

Compilation flags:
```
static
```

Template:
```
random_subsequence(List,Subsequence)
```
Mode and number of proofs:
```
random_subsequence(+list,-list) - one
```

Examples:

Random subsequence
```
random_subsequence([a,b,c],Subsequence)
Subsequence=[a,c]
```

---

subsequences_with_min_span/3

Generates subsequences where consecutive elements are at least MinSpan positions apart in the original list.

Compilation flags:
```
static
```

Template:
```
subsequences_with_min_span(MinSpan,List,Subsequence)
```
Mode and number of proofs:

```
subsequences_with_min_span(+integer,+list,-list) - one
subsequences_with_min_span(+integer,+list,?list) - zero_or_more
```

Examples:

Min span of 2

```
subsequences_with_min_span(2,[a,b,c,d],Subsequence)
Subsequence=[a,c]
```

---

alternating_subsequences/2

Generates all subsequences that alternate between increasing and decreasing (or vice versa). Elements must be comparable.

Compilation flags:

```
static
```

Template:

```
alternating_subsequences(List,AlternatingSubsequences)
```

Mode and number of proofs:

```
alternating_subsequences(+list,-list) - one
```

Examples:

All alternating subsequences

```
alternating_subsequences([1,3,2,4],AlternatingSubsequences)
AlternatingSubsequences=[[1,2],[1,3],[1,4],[2,3],[2,4],[3,4]]
```

---

alternating_subsequence/2

True iff the second argument is a subsequence that alternates between increasing and decreasing (or vice versa). Elements must be comparable.

Compilation flags:

```
static
```

Template:

```
alternating_subsequence(List,AlternatingSubsequence)
```

Mode and number of proofs:

```
alternating_subsequence(+list,-list) - one_or_more
```

Examples:

Alternating

```
alternating_subsequence([1,3,2,4],AlternatingSubsequence)
AlternatingSubsequence=[[1,2],[1,3],[1,4],[2,3],[2,4],[3,4]]
```

---

k_distinct_subsequences/3

Generates all K-element subsequences where all elements are distinct (no duplicates in the subsequence itself).

Compilation flags:

```
static
```

Template:

```
k_distinct_subsequences(K,List,DistinctSubsequences)
```

Mode and number of proofs:

```
k_distinct_subsequences(+integer,+list,-list) - one
```

Examples:

All distinct only

```
k_distinct_subsequences(2,[a,a,b],DistinctSubsequences)
DistinctSubsequences=[[a,b],[a,c],[b,c]]
```

---

k_distinct_subsequence/3

True iff the third argument is a subsequence of the first argument that is a K-element subsequence where all elements are distinct (no duplicates in the subsequence itself).

Compilation flags:

```
static
```

Template:

```
k_distinct_subsequence(K,List,DistinctSubsequence)
```

Mode and number of proofs:

```
k_distinct_subsequence(+integer,+list,-list) - one
```

Examples:

A distinct only

```
k_distinct_subsequence(2,[a,a,b],DistinctSubsequence)
DistinctSubsequence=[a,b]
```

---

count_subsequences/2

Counts the total number of subsequences (always 2^N for a list of length N).

Compilation flags:

```
static
```

Template:

```
count_subsequences(List,Count)
```

Mode and number of proofs:

```
count_subsequences(+list,-integer) - one
```

Examples:

Count

```
count_subsequences([a,b,c],Count)
Count=8
```

---

subsequence_length/2

Returns the length of a subsequence (same as list length, provided for consistency).

Compilation flags:

```
static
```

Template:

```
subsequence_length(Subsequence,Length)
```

Mode and number of proofs:

```
subsequence_length(+list,-integer) - one
```

Examples:

Length

```
subsequence_length([a,b,c],Length)
Length=3
```

1.314 svr_regression

object

1.314.1 svr_regression

Support vector regression (SVR) using an epsilon-insensitive dual margin model with linear, polynomial, and radial basis function kernels, trained with a Pegasos-style dual subgradient descent loop. Learns from a dataset object implementing the `regression_dataset_protocol` protocol and returns a regressor term that can be used for prediction and exported as predicate clauses.

Availability:

```
logtalk_load(svr_regression(loader))
```

Author: Paulo Moura
Version: 1:0:1
Date: 2026-10-13

Compilation flags:

1.315 tabu_search

object

1.315.1 `tabu_search(Problem)`

- `Problem` - Problem object implementing `tabu_search_problem_protocol`.

Tabu search optimization algorithm using the Xoshiro128++ random number generator via `fast_random(xoshiro128pp)`.

Availability:
`logtalk_load(tabu_search(loader))`

Author: Paulo Moura
Version: 2:0:0
Date: 2026-11-19

tabu_search(Problem,Random), *tabu_search_problem_protocol*

object

1.315.2 `tabu_search(Problem,Random)`

- `Problem` - Problem object implementing `tabu_search_problem_protocol`.
- `Random` - Random number generator object providing `between/3`, `randomize/1`, `permutation/2`, and `sample/4` predicates.

Tabu search optimization algorithm. Parameterized by a problem object implementing the `tabu_search_problem_protocol` protocol and by a random number generator algorithm for the `fast_random` library. Minimizes energy with optional problem-defined tabu keys, tenure, aspiration, restart states, neighbor generation, stopping, and progress reporting.

Public predicates

run/2

Runs the tabu search algorithm using default options and returns the best state found and its energy.

Compilation flags:
`static`

Template:
`run(BestState,BestEnergy)`
Mode and number of proofs:
`run(-nonvar,-number)` - `one`

Exceptions:
An implemented output hook fails or returns an invalid value:
`domain_error(tabu_hook_result,Result)`

---

run/3

Runs the tabu search algorithm using the given options and returns the best state found and its energy.

Compilation flags:
`static`

Template:
`run(BestState,BestEnergy,Options)`
Mode and number of proofs:
`run(-nonvar,-number,+list(compound))` - `one`

Exceptions:

An option is invalid:

```
domain_error(option,Option)
```

Exhaustive mode requires implemented enumeration:

```
existence_error(procedure,Problem::neighbors/2)
```

An implemented output hook fails or returns an invalid value:

```
domain_error(tabu_hook_result,Result)
```

Remarks:

- `max_steps(N)` option: Maximum number of iterations per cycle (default: `10000`).
- `tabu_tenure(T)` option: Fixed lifetime in selection steps (default: `7`). Ignored when a range or a problem `tabu_tenure/4` implementation is present.
- `tabu_tenure_range(Min, Max)` option: Uniform random tenure in the inclusive integer range. Overrides fixed tenure; ignored when the problem implements `tabu_tenure/4`.
- `candidates(N)` option: Number of candidate neighbors examined per iteration (default: `20`).
- `exhaustive(Boolean)` option: Evaluates the full `neighbors/2` list in source order when true, ignoring the candidate limit (default: `false`). Requires implemented enumeration.
- `updates(N)` option: Number of progress reports during the run. Set to `0` to disable. Progress is reported by calling `progress/5` on the problem object (default: `0`).
- `seed(S)` option: Positive integer seed for the random number generator, enabling reproducible runs (default: none).
- `restarts(N)` option: Number of additional cycles (default: `0`). Clears memory and uses `restart_state/2` when implemented, otherwise the global best state.

`run/4`

Runs the tabu search algorithm using the given options, returns the best state found and its energy, and returns run statistics.

Compilation flags:

```
static
```

Template:

```
run(BestState,BestEnergy,Statistics,Options)
```

Mode and number of proofs:

```
run(-nonvar,-number,-list(compound),+list(compound)) - one
```

Exceptions:

An option is invalid:

```
domain_error(option,Option)
```

Exhaustive mode requires implemented enumeration:

```
existence_error(procedure,Problem::neighbors/2)
```

An implemented output hook fails or returns an invalid value:

```
domain_error(tabu_hook_result,Result)
```

Remarks:

- Statistics list: A list of `Key(Value)` pairs: `steps(N)` is the number of steps executed, `acceptances(A)` is the number of accepted moves, `improvements(I)` is the number of moves that improved the best energy, and `final_tabu_size(S)` is the number of non-expired tabu entries at termination.

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

select_candidate/10

Selects the best admissible candidate using the cached run policy.

Compilation flags:

```
static
```

Template:

```
select_candidate(Policy,State,Energy,BestEnergy,Tabu,Step,Candidates,Neighbor,
NeighborEnergy,Accepted)
```

Mode and number of proofs:

```
select_candidate(+compound,+nonvar,+number,+number,+list,+non_negative_integer,
+positive_integer,-nonvar,-number,-boolean) - one
```

Exceptions:

Enumeration fails in exhaustive mode:

```
domain_error(tabu_hook_result,neighbors/2)
```

A key hook returns an invalid result:

```
domain_error(tabu_hook_result,Result)
```

---

require_neighborhood/2

Checks the implementation required for exhaustive evaluation.

Compilation flags:

```
static
```

Template:

```
require_neighborhood(Exhaustive,Problem)
```

Mode and number of proofs:

```
require_neighborhood(+boolean,+object_identifier) - one
```

Exceptions:

Enumeration is not implemented:

```
existence_error(procedure,Problem::neighbors/2)
```

---

restart_candidate/7

Resolves a restart state and updates the global best independently.

Compilation flags:
`static`

Template:
`restart_candidate(Policy,Best,BestEnergy,State,Energy,NewBest,NewBestEnergy)`
Mode and number of proofs:
`restart_candidate(+compound,+nonvar,+number,-nonvar,-number,-nonvar,-number)` - `one`

Exceptions:
The restart hook fails or returns an invalid state:
`domain_error(tabu_hook_result,Result)`

---

state_key/3

Resolves an optional tabu key without copying the state.

Compilation flags:
`static`

Template:
`state_key(KeyHook,State,Key)`
Mode and number of proofs:
`state_key(+boolean,+nonvar,-nonvar)` - `one`

Exceptions:
The key hook fails or returns an unbound key:
`domain_error(tabu_hook_result,Result)`

---

resolve_tenure/6

Resolves tenure with hook, range, then fixed-option precedence.

Compilation flags:
`static`

Template:
`resolve_tenure(TenureHook,Specification,Step,BestEnergy,CurrentEnergy,Tenure)`
Mode and number of proofs:
`resolve_tenure(+boolean,+compound,+non_negative_integer,+number,+number,`
`-non_negative_integer)` - `one`

Exceptions:
The tenure hook fails or returns an invalid value:
`domain_error(tabu_hook_result,Result)`

Operators

(none)

tabu_search(Problem), *tabu_search_problem_protocol*

protocol

1.315.3 tabu_search_problem_protocol

Protocol for tabu search problems, with optional tabu keys, tenure, aspiration, restart diversification, delta-energy generation, neighborhood enumeration, stopping, and progress reporting.

Availability:
`logtalk_load(tabu_search(loader))`

Author: Paulo Moura
Version: 2:0:0
Date: 2026-10-10

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *initial_state/1*
  - *neighbor_state/2*
  - *neighbor_state/3*
  - *neighbors/2*
  - *tabu_key/2*
  - *aspiration/3*
  - *tabu_tenure/4*

    - *restart_state/2*
    - *state_energy/2*
    - *stop_condition/3*
    - *progress/5*
  - *Protected predicates*
  - *Private predicates*
  - *Operators*

Public predicates

initial_state/1

Returns an initial state for the optimization problem.

Compilation flags:
`static`

Template:
`initial_state(State)`
Mode and number of proofs:
`initial_state(-nonvar)` - `one`

---

neighbor_state/2

Generates a neighboring state from the given state. This is the most problem-specific predicate and its definition determines the quality of the search. Used both for candidate sampling and (when `neighbors/2` is not defined) as the sole neighborhood operator.

Compilation flags:
`static`

Template:
`neighbor_state(State,Neighbor)`
Mode and number of proofs:
`neighbor_state(+nonvar,-nonvar)` - `one`

---

neighbor_state/3

Generates a neighboring state and returns the energy change (delta) directly, avoiding a full energy recomputation. Optional. When not defined by the problem, the algorithm calls `neighbor_state/2` and `state_energy/2` instead.

Compilation flags:

```
static
```

Template:

```
neighbor_state(State,Neighbor,DeltaEnergy)
```

Mode and number of proofs:

```
neighbor_state(+nonvar,-nonvar,-number) - one
```

---

neighbors/2

Optionally returns the complete neighborhood. With `exhaustive(true)`, an implementation must succeed for every visited state, including empty neighborhoods, and all candidates are evaluated in source order. Otherwise the candidate limit controls sampling and failure falls back to neighbor generation.

Compilation flags:

```
static
```

Template:

```
neighbors(State,Neighbors)
```

Mode and number of proofs:

```
neighbors(+nonvar,-list(nonvar)) - zero_or_one
```

Exceptions:

Exhaustive mode has no implemented enumeration predicate:

```
existence_error(procedure,Problem::neighbors/2)
```

Enumeration fails in exhaustive mode:

```
domain_error(tabu_hook_result,neighbors/2)
```

---

tabu_key/2

Optionally returns a stable tabu-equivalence key without instantiating the state. Absent implementations use the state itself. Keys are compared using strict term identity; shared variables retain identity, while fresh variables do not provide stable equivalence.

Compilation flags:

```
static
```

Template:

```
tabu_key(State,Key)
```

Mode and number of proofs:

```
tabu_key(+nonvar,-nonvar) - one
```

Exceptions:

An implemented hook fails:

```
domain_error(tabu_hook_result,tabu_key/2)
```

An implemented hook returns an unbound key:

```
domain_error(tabu_hook_result,tabu_key/2-Key)
```

---

aspiration/3

Optionally permits an otherwise tabu contender. Success permits the move; failure rejects it even when it improves the global best. Absent implementations use strict best-so-far aspiration. Called only for tabu candidates that could win selection; implementations should be pure and must not instantiate the candidate.

Compilation flags:

```
static
```

Template:

```
aspiration(CandidateState,CandidateEnergy,BestEnergy)
```

Mode and number of proofs:

```
aspiration(+nonvar,+number,+number) - zero_or_one
```

---

tabu_tenure/4

Optionally returns tenure once per accepted move, using the zero-based global selection step and pre-move best and current energies. Overrides fixed and ranged options. Zero skips insertion without erasing earlier active entries; existing expiration steps never change.

Compilation flags:

```
static
```

Template:

```
tabu_tenure(Step,BestEnergy,CurrentEnergy,Tenure)
```

Mode and number of proofs:

```
tabu_tenure(+non_negative_integer,+number,+number,-non_negative_integer) - one
```

Exceptions:

An implemented hook fails:

```
domain_error(tabu_hook_result,tabu_tenure/4)
```

An implemented hook returns an invalid tenure:

```
domain_error(tabu_hook_result,tabu_tenure/4-Tenure)
```

---

restart_state/2

Optionally returns a restart state without instantiating the global best state. Called only between cycles. Its energy is recomputed and may update the best, without incrementing move statistics. Absent implementations restart from the best with its cached energy.

Compilation flags:

```
static
```

Template:

```
restart_state(BestState,RestartState)
```

Mode and number of proofs:

```
restart_state(+nonvar,-nonvar) - one
```

Exceptions:

An implemented hook fails:

```
domain_error(tabu_hook_result,restart_state/2)
```

An implemented hook returns an unbound state:

```
domain_error(tabu_hook_result,restart_state/2-RestartState)
```

---

state_energy/2

Computes the energy (cost) of the given state. The algorithm minimizes this value.

Compilation flags:

```
static
```

Template:

```
state_energy(State,Energy)
```

Mode and number of proofs:

```
state_energy(+nonvar,-number) - one
```

---

stop_condition/3

True when the search should stop given the current step, best energy found so far, and current energy. Optional. When not defined by the problem, the search runs until the maximum number of steps is reached.

Compilation flags:

```
static
```

Template:

```
stop_condition(Step,BestEnergy,CurrentEnergy)
```

Mode and number of proofs:

```
stop_condition(+non_negative_integer,+number,+number) - zero_or_one
```

---

progress/5

Called with completed global steps and the actual current energy. Optional. The acceptance and improvement rates are computed since the preceding report, or since the cycle began for its first report. A zero-step interval has zero rates. When reporting is enabled, each cycle has a final report that replaces any coincident periodic report.

Compilation flags:
`static`

Template:
`progress(Step,BestEnergy,CurrentEnergy,AcceptanceRate,ImprovementRate)`
Mode and number of proofs:
`progress(+non_negative_integer,+number,+number,+number,+number)` - `zero_or_one`

Public predicates

read_term_from_atom/3

Reads a term from an atom using the given read options. A period at the end of the atom is optional. Valid options are those supported by the standard `read_term/3` predicate.

Compilation flags:
`static, synchronized`

Template:
`read_term_from_atom(Atom,Term,Options)`

Mode and number of proofs:
`read_term_from_atom(+atom,-term,+list(read_option))` - `one_or_error`

Exceptions:
`Atom` is a variable:
`instantiation_error`
`Atom` is neither a variable nor an atom:
`type_error(atom,Atom)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(read_option,Option)`

read_from_atom/2

Reads a term from an atom using default read options. Shorthand for `read_term_from_atom(Atom,Term,[])`. A period at the end of the atom is optional.

Compilation flags:
`static`

Template:
`read_from_atom(Atom,Term)`
Mode and number of proofs:
`read_from_atom(+atom,-term)` - `one_or_error`

Exceptions:
`Atom` is a variable:
`instantiation_error`
`Atom` is neither a variable nor an atom:
`type_error(atom,Atom)`
`Atom` text cannot be read as a term:
`syntax_error(BackendDependentArgument)`

---

read_term_from_chars/3

Reads a term from a list of characters using the given read options. A period at the end of the list is optional. Valid options are those supported by the standard `read_term/3` predicate.

Compilation flags:
`static, synchronized`

Template:
`read_term_from_chars(Chars,Term,Options)`
Mode and number of proofs:
`read_term_from_chars(+list(character),-term,+list(read_option))` - `one_or_error`

Exceptions:
`Chars` contains a variable element:
`instantiation_error`
`Chars` contains an element that is not a character:
`type_error(character,Char)`
`Chars` text cannot be read as a term:
`syntax_error(BackendDependentArgument)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(read_option,Option)`

---

read_term_from_chars/4

Reads a term from a list of characters using the given read options, also returning the remaining characters. A period at the end of the term is required. Valid options are those supported by the standard `read_term/3` predicate.

Compilation flags:
`static`

Template:
`read_term_from_chars(Chars,Term,Tail,Options)`
Mode and number of proofs:
`read_term_from_chars(+list(character),-term,-list(character),+list(read_option))` - `one_or_error`

Exceptions:
`Chars` contains an element that is not a character:
`type_error(character,Char)`
`Chars` text cannot be read as a term:
`syntax_error(BackendDependentArgument)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(read_option,Option)`

---

read_from_chars/2

Reads a term from a list of characters using default read options. Shorthand for `read_term_from_chars(Chars,Term,[])`. A period at the end of the list is optional.

Compilation flags:
`static`

Template:
`read_from_chars(Chars,Term)`

Mode and number of proofs:

`read_from_chars(+list(character),-term)` - `one_or_error`

Exceptions:

`Chars` contains a variable element:

`instantiation_error`

`Chars` contains an element that is not a character:

`type_error(character,Char)`

`Chars` text cannot be read as a term:

`syntax_error(BackendDependentArgument)`

`read_term_from_codes/3`

Reads a term from a list of character codes using the given read options. A period at the end of the list is optional. Valid options are those supported by the standard `read_term/3` predicate.

Compilation flags:

`static, synchronized`

Template:

`read_term_from_codes(Codes,Term,Options)`

Mode and number of proofs:

`read_term_from_codes(+list(character_code),-term,+list(read_option))` - `one_or_error`

Exceptions:

`Codes` contains a variable element:

`instantiation_error`

`Codes` contains an element that is not a character code:

`type_error(integer,Code)`

`Codes` text cannot be read as a term:

`syntax_error(BackendDependentArgument)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(read_option,Option)`

---

read_term_from_codes/4

Reads a term from a list of character codes using the given read options, also returning the remaining character codes. A period at the end of the term is required. Valid options are those supported by the standard `read_term/3` predicate.

Compilation flags:

`static`

Template:

`read_term_from_codes(Codes,Term,Tail,Options)`

Mode and number of proofs:

`read_term_from_codes(+list(character_code),-term,-list(character_code),+list(read_option))` - `one_or_error`

Exceptions:

`Codes` contains an element that is not a character code:

`type_error(integer,Code)`

`Codes` text cannot be read as a term:

`syntax_error(BackendDependentArgument)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(read_option,Option)`

---

read_from_codes/2

Reads a term from a list of character codes using default read options. Shorthand for `read_term_from_codes(Codes,Term,[])`. A period at the end of the list is optional.

Compilation flags:

`static`

Template:

`read_from_codes(Codes,Term)`

Mode and number of proofs:

`read_from_codes(+list(character_code),-term)` - `one_or_error`

Exceptions:

`Codes` contains a variable element:

`instantiation_error`

`Codes` contains an element that is not a character code:

`type_error(integer,Code)`

`Codes` text cannot be read as a term:
`syntax_error(BackendDependentArgument)`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(read_option,Option)`

---

write_term_to_atom/3

Writes a term to an atom using the given write options. Valid options are those supported by the standard `write_term/3` predicate.

Compilation flags:
`static, synchronized`

Template:
`write_term_to_atom(Term,Atom,Options)`
Mode and number of proofs:
`write_term_to_atom(@term,-atom,+list(write_option))` - `one`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(write_option,Option)`

---

write_to_atom/2

Writes a term to an atom using default write options. Shorthand for `write_term_to_atom(Term,Atom,[])`.

Compilation flags:
`static`

Template:
`write_to_atom(Term,Atom)`
Mode and number of proofs:
`write_to_atom(@term,-atom)` - `one`

---

write_term_to_chars/3

Writes a term to a list of characters using the given write options. Shorthand for `write_term_to_chars(Term,Chars,[],Options)`. Valid options are those supported by the standard `write_term/3` predicate.

Compilation flags:
`static`

Template:
`write_term_to_chars(Term,Chars,Options)`
Mode and number of proofs:
`write_term_to_chars(@term,-list(character),+list(write_option))` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(write_option,Option)`

---

write_term_to_chars/4

Writes a term to a list of characters with the given tail using the given write options. Valid options are those supported by the standard `write_term/3` predicate.

Compilation flags:

`static, synchronized`

Template:

`write_term_to_chars(Term,Chars,Tail,Options)`

Mode and number of proofs:

`write_term_to_chars(@term,-list(character),@term,+list(write_option))` - `one_or_error`

Exceptions:

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(write_option,Option)`

---

write_to_chars/2

Writes a term to a list of characters using default write options. Shorthand for `write_term_to_chars(Term,Chars,[],[])`.

Compilation flags:

`static`

Template:

`write_to_chars(Term,Chars)`

Mode and number of proofs:

`write_to_chars(@term,-list(character))` - `one`

---

write_term_to_codes/3

Writes a term to a list of character codes using the given write options. Shorthand for `write_term_to_codes(Term,Codes,[],Options)`. Valid options are those supported by the standard `write_term/3` predicate.

Compilation flags:
`static`

Template:
`write_term_to_codes(Term,Codes,Options)`

Mode and number of proofs:
`write_term_to_codes(@term,-list(character_code),+list(write_option))` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(write_option,Option)`

---

write_term_to_codes/4

Writes a term to a list of character codes with the given tail using the given write options. Valid options are those supported by the standard `write_term/3` predicate.

Compilation flags:
`static, synchronized`

Template:
`write_term_to_codes(Term,Codes,Tail,Options)`

Mode and number of proofs:
`write_term_to_codes(@term,-list(character_code),@term,+list(write_option))` - `one_or_error`

Exceptions:
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(write_option,Option)`

---

write_to_codes/2

Writes a term to a list of character codes using default write options. Shorthand for `write_term_to_chars(Term,Codes,[],[])`.

Compilation flags:
`static`

Template:
`write_to_codes(Term,Codes)`
Mode and number of proofs:
`write_to_codes(@term,-list(character_code))` - `one`

---

format_to_atom/3

Writes a list of arguments to an atom using the given format (specified as in the de facto standard `format/2` predicate).

Compilation flags:
`static, synchronized`

Template:
`format_to_atom(Format,Arguments,Atom)`
Mode and number of proofs:
`format_to_atom(@atom,+list(term),-atom)` - `one`

---

format_to_chars/3

Writes a list of arguments to a list of characters using the given format (specified as in the de facto standard `format/2` predicate). Shorthand for `format_to_chars(Format,Arguments,Chars,[])`.

Compilation flags:
`static`

Template:
`format_to_chars(Format,Arguments,Chars)`
Mode and number of proofs:
`format_to_chars(@term,+list(term),-list(character))` - `one`

---

format_to_chars/4

Writes a term to a list of characters with the given tail using the given format (specified as in the de facto standard `format/2` predicate).

Compilation flags:

```
static, synchronized
```

Template:

```
format_to_chars(Format,Arguments,Chars,Tail)
```

Mode and number of proofs:

```
format_to_chars(@term,+list(term),-list(character),@term) - one
```

---

format_to_codes/3

Writes a list of arguments to a list of character codes using the given format (specified as in the de facto standard `format/2` predicate). Shorthand for `format_to_codes(Format,Arguments,Codes,[])`.

Compilation flags:

```
static
```

Template:

```
format_to_codes(Format,Arguments,Codes)
```

Mode and number of proofs:

```
format_to_codes(@term,+list(term),-list(character_code)) - one
```

---

format_to_codes/4

Writes a list of arguments to a list of character codes with the given tail using the given format (specified as in the de facto standard `format/2` predicate).

Compilation flags:

```
static, synchronized
```

Template:

```
format_to_codes(Format,Arguments,Codes,Tail)
```

Mode and number of proofs:

```
format_to_codes(@term,+list(term),-list(character_code),@term) - one
```

---

with_output_to/2

Calls a goal deterministically with output to the given format: `atom(Atom)`, `chars(Chars)`, `chars(Chars,Tail)`, `codes(Codes)`, or `codes(Codes,Tail)`.

Compilation flags:
`static, synchronized`

Template:
`with_output_to(Output,Goal)`
Meta-predicate template:
`with_output_to(*,0)`
Mode and number of proofs:
`with_output_to(+compound,+callable)` - `zero_or_one`

  - *fold_diacritics_codes/3*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

remove_diacritics_codes/2

Canonically decomposes text, removes all Unicode Mark-category code points, and returns NFC text.

Compilation flags:

```
static
```

Template:

```
remove_diacritics_codes(Codes,Removed)
```

Mode and number of proofs:

```
remove_diacritics_codes(+list(integer),-list(integer)) - one_or_error
```

Exceptions:

An input element is not a Unicode scalar value:

```
domain_error(unicode_scalar_value,Code)
```

---

fold_diacritics_codes/3

Removes Unicode marks, applies profile transliterations to remaining code points, and returns NFC text.

Compilation flags:

```
static
```

Template:

```
fold_diacritics_codes(Codes,Profile,Folded)
```

Mode and number of proofs:

```
fold_diacritics_codes(+list(integer),+object_identifier,-list(integer)) -
one_or_error
```

Exceptions:

An input element is not a Unicode scalar value:

```
domain_error(unicode_scalar_value,Code)
```

category

1.317.5 `text_entities`

Portable character reference decoding rules over lists of Unicode code points.

Availability:
`logtalk_load(text_normalization(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-06

Compilation flags:
`static`

Uses:
list

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
- *Protected predicates*
  - *decode_entities_codes/4*
- *Private predicates*
- *Operators*

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

decode_entities_codes/4

Decodes semicolon-terminated numeric and profile-defined named character references. The unknown-name policy is `preserve` or `error`.

Compilation flags:
`static`

Template:
`decode_entities_codes(Codes,Profile,Unknown,Decoded)`

Mode and number of proofs:
`decode_entities_codes(+list(integer),+object_identifier,+atom,-list(integer))` - `one_or_error`

Exceptions:
A numeric reference denotes a value that is not a Unicode scalar value:
`domain_error(unicode_scalar_value,Value)`
A named reference is unknown and the policy is `error`:
`domain_error(character_reference,Reference)`

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

text_normalization_profile_protocol, *text_normalizer(Representation,Profile)*

protocol

1.317.6 text_normalization_profile_protocol

Profile provider protocol for extending text normalization policy without replacing Unicode normalization algorithms.

Availability:
`logtalk_load(text_normalization(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-06

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *case_conversion/3*
  - *diacritic_fold/2*
  - *named_entity/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

case_conversion/3

Converts a list of Unicode code points for a profile-specific case operation. Valid operations are `fold`, `lower`, `upper`, and `title`. Fails to select the library default Unicode behavior.

Compilation flags:
`static`

Template:
`case_conversion(Operation,Codes,Converted)`

Mode and number of proofs:
`case_conversion(+atom,+codes,-codes)` - `zero_or_one`

---

diacritic_fold/2

Maps a Unicode code point without a canonical base decomposition to a profile-specific replacement. Fails when no mapping is defined.

Compilation flags:
`static`

Template:
`diacritic_fold(Code,Replacement)`

Mode and number of proofs:
`diacritic_fold(+code,-codes)` - `zero_or_one`

---

named_entity/2

Maps a case-sensitive named character reference, without the leading ampersand or trailing semicolon, to Unicode code points. Fails for an unknown name.

Compilation flags:
`static`

Template:
`named_entity(Name,Codes)`
Mode and number of proofs:
`named_entity(+atom,-codes)` - `zero_or_one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)

Public predicates

normalize_unicode/3

Normalizes text to the specified Unicode normalization form. Valid forms are `nfc`, `nfd`, `nfkc`, and `nfkd`.

Compilation flags:

`static`

Template:

`normalize_unicode(Form,Text,Normalized)`

Mode and number of proofs:

`normalize_unicode(+atom,+text,-text)` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Profile` parameter is a variable:

`instantiation_error`

The `Profile` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Profile)`

The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:

`domain_error(text_normalization_profile,Profile)`

`Form` is a variable:

`instantiation_error`

`Form` is not an atom:

`type_error(atom,Form)`

`Form` is not a supported Unicode normalization form:

`domain_error(unicode_normalization_form,Form)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

remove_diacritics/2

Canonically decomposes text, removes Unicode mark characters, and returns NFC text.

Compilation flags:
`static`

Template:
`remove_diacritics(Text,Normalized)`
Mode and number of proofs:
`remove_diacritics(+text,-text)` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Profile` parameter is a variable:
`instantiation_error`
The `Profile` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Profile)`
The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:
`domain_error(text_normalization_profile,Profile)`
`Text` is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but `Text` is not an atom:
`type_error(atom,Text)`
The `Representation` parameter is `chars` but `Text` is not a list of characters:
`type_error(chars,Text)`
The `Representation` parameter is `codes` but `Text` is not a list of character codes:
`type_error(codes,Text)`
An input character code is not a Unicode scalar value:
`domain_error(unicode_scalar_value,Code)`

---

fold_diacritics/2

Removes diacritics and applies profile-defined transliterations for characters without canonical decompositions.

Compilation flags:
`static`

Template:
`fold_diacritics(Text,Normalized)`
Mode and number of proofs:
`fold_diacritics(+text,-text)` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Profile` parameter is a variable:
`instantiation_error`
The `Profile` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Profile)`
The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:
`domain_error(text_normalization_profile,Profile)`
`Text` is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but `Text` is not an atom:
`type_error(atom,Text)`
The `Representation` parameter is `chars` but `Text` is not a list of characters:
`type_error(chars,Text)`
The `Representation` parameter is `codes` but `Text` is not a list of character codes:
`type_error(codes,Text)`
An input character code is not a Unicode scalar value:
`domain_error(unicode_scalar_value,Code)`

`case_fold/2`

Applies full default Unicode case folding, unless overridden by the selected profile.

Compilation flags:
`static`

Template:
`case_fold(Text,Folded)`
Mode and number of proofs:
`case_fold(+text,-text)` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Profile` parameter is a variable:
`instantiation_error`
The `Profile` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Profile)`
The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:
`domain_error(text_normalization_profile,Profile)`
`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

`lower_case/2`

Converts text to lowercase using the selected profile and Unicode default casing.

Compilation flags:

`static`

Template:

`lower_case(Text,Lowercase)`

Mode and number of proofs:

`lower_case(+text,-text)` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Profile` parameter is a variable:

`instantiation_error`

The `Profile` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Profile)`

The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:

`domain_error(text_normalization_profile,Profile)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

---

upper_case/2

Converts text to uppercase using the selected profile and Unicode default casing.

Compilation flags:
`static`

Template:
`upper_case(Text,Uppercase)`
Mode and number of proofs:
`upper_case(+text,-text)` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Profile` parameter is a variable:
`instantiation_error`
The `Profile` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Profile)`
The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:
`domain_error(text_normalization_profile,Profile)`
`Text` is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but `Text` is not an atom:
`type_error(atom,Text)`
The `Representation` parameter is `chars` but `Text` is not a list of characters:
`type_error(chars,Text)`
The `Representation` parameter is `codes` but `Text` is not a list of character codes:
`type_error(codes,Text)`
An input character code is not a Unicode scalar value:
`domain_error(unicode_scalar_value,Code)`

---

title_case/2

Converts text to title case using the library simple word-boundary definition.

Compilation flags:
`static`

Template:
`title_case(Text,Titlecase)`
Mode and number of proofs:
`title_case(+text,-text)` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Profile` parameter is a variable:
`instantiation_error`
The `Profile` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Profile)`
The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:
`domain_error(text_normalization_profile,Profile)`
`Text` is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but `Text` is not an atom:
`type_error(atom,Text)`
The `Representation` parameter is `chars` but `Text` is not a list of characters:
`type_error(chars,Text)`
The `Representation` parameter is `codes` but `Text` is not a list of character codes:
`type_error(codes,Text)`
An input character code is not a Unicode scalar value:
`domain_error(unicode_scalar_value,Code)`

`decode_entities/2`

Decodes semicolon-terminated XML, numeric, and profile-defined named character references using default options.

Compilation flags:
`static`

Template:
`decode_entities(Text,Decoded)`
Mode and number of proofs:
`decode_entities(+text,-text)` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Profile` parameter is a variable:
`instantiation_error`
The `Profile` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Profile)`
The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:
`domain_error(text_normalization_profile,Profile)`
`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

A numeric character reference denotes a value that is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Value)`

`decode_entities/3`

Decodes semicolon-terminated character references. The recognized option is `unknown(preserve|error)`.

Compilation flags:

`static`

Template:

`decode_entities(Text,Decoded,Options)`

Mode and number of proofs:

`decode_entities(+text,-text,+list(compound))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Profile` parameter is a variable:

`instantiation_error`

The `Profile` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Profile)`

The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:

`domain_error(text_normalization_profile,Profile)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

A numeric character reference denotes a value that is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Value)`

A named character reference is unknown and the `unknown(error)` option is used:

`domain_error(character_reference,Reference)`

`normalize_whitespace/2`

Normalizes whitespace using default options.

Compilation flags:

`static`

Template:

`normalize_whitespace(Text,Normalized)`

Mode and number of proofs:

`normalize_whitespace(+text,-text)` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Profile` parameter is a variable:

`instantiation_error`

The `Profile` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Profile)`

The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:

`domain_error(text_normalization_profile,Profile)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

`normalize_whitespace/3`

Normalizes whitespace. Recognized options are `trim(Boolean)`, `collapse(none|horizontal|all)`, `line_endings(lf|crlf|cr|preserve)`, and `controls(preserve|remove)`.

Compilation flags:

`static`

Template:

`normalize_whitespace(Text,Normalized,Options)`

Mode and number of proofs:

`normalize_whitespace(+text,-text,+list(compound))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Profile` parameter is a variable:

`instantiation_error`

The `Profile` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Profile)`

The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:

`domain_error(text_normalization_profile,Profile)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

clean/2

Cleans text using the default normalization pipeline options.

Compilation flags:

`static`

Template:

`clean(Text,Cleaned)`

Mode and number of proofs:

`clean(+text,-text)` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Profile` parameter is a variable:

`instantiation_error`

The `Profile` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Profile)`

The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:

`domain_error(text_normalization_profile,Profile)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

A numeric character reference denotes a value that is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Value)`

clean/3

Cleans text by applying entity decoding, case conversion, diacritic handling, Unicode normalization, and whitespace normalization in that order.

Compilation flags:

`static`

Template:

`clean(Text,Cleaned,Options)`

Mode and number of proofs:

`clean(+text,-text,+list(compound))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Profile` parameter is a variable:

`instantiation_error`

The `Profile` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Profile)`

The `Profile` parameter is an object identifier but not an object conforming to `text_normalization_profile_protocol`:

`domain_error(text_normalization_profile,Profile)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

An input character code is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Code)`

A numeric character reference denotes a value that is not a Unicode scalar value:

`domain_error(unicode_scalar_value,Value)`

A named character reference is unknown and the `unknown_entities(error)` option is used:

`domain_error(character_reference,Reference)`

Public predicates

learn/2

Learns a vectorizer from a non-empty corpus using default options. Documents are lists of ground features.

Compilation flags:

`static`

Template:

`learn(Corpus,Vectorizer)`

Mode and number of proofs:

`learn(+list(list),-compound)` - `one_or_error`

Exceptions:

`Corpus` is a variable or a partial list:

`instantiation_error`

`Corpus` is neither a variable nor a list:

`type_error(list,Corpus)`

`Corpus` is empty:

`domain_error(non_empty_corpus,Corpus)`

An element `Document` of the list `Corpus` is a variable or a partial list:

`instantiation_error`

An element `Document` of the list `Corpus` is neither a variable nor a list:

`type_error(list,Document)`

An element `Feature` of a document is not a ground term:

`instantiation_error`

No corpus feature satisfies the document-frequency filters:

`domain_error(non_empty_vocabulary,Corpus)`

learn/3

Learns a vectorizer from a non-empty corpus using the given options. Documents are lists of ground features.

Compilation flags:

`static`

Template:

`learn(Corpus,Vectorizer,Options)`

Mode and number of proofs:

`learn(+list(list),-compound,+list(compound))` - `one_or_error`

Exceptions:

`Corpus` is a variable or a partial list:

`instantiation_error`

`Corpus` is neither a variable nor a list:

`type_error(list,Corpus)`

`Corpus` is empty:

`domain_error(non_empty_corpus,Corpus)`

An element `Document` of the list `Corpus` is a variable or a partial list:

`instantiation_error`

An element `Document` of the list `Corpus` is neither a variable nor a list:

`type_error(list,Document)`

An element `Feature` of a document is not a ground term:

`instantiation_error`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:

`type_error(list,Options)`

An element `Option` of the list `Options` is a variable:

`instantiation_error`

An element `Option` of the list `Options` is neither a variable nor a compound term:

`type_error(compound,Option)`

An element `Option` of the list `Options` is a compound term but not a valid option:

`domain_error(option,Option)`

The `maximum_document_frequency(Maximum)` option value is greater than the corpus document count:

`domain_error(option,maximum_document_frequency(Maximum))`

The `minimum_document_frequency(Minimum)` option value is greater than the effective maximum document frequency:

`domain_error(option,minimum_document_frequency(Minimum))`

No corpus feature satisfies the document-frequency filters:

`domain_error(non_empty_vocabulary,Corpus)`

transform/3

Transforms a document into a sparse list of `Feature-Weight` pairs in standard term order. Out-of-vocabulary features are ignored.

Compilation flags:
`static`

Template:
`transform(Vectorizer,Document,Vector)`
Mode and number of proofs:
`transform(+compound,+list,-list(pair))` - `one_or_error`

Exceptions:
`Vectorizer` is a variable:
`instantiation_error`
`Vectorizer` is neither a variable nor a valid text vectorizer:
`domain_error(text_vectorizer,Vectorizer)`
`Document` is a variable or a partial list:
`instantiation_error`
`Document` is neither a variable nor a list:
`type_error(list,Document)`
An element `Feature` of the list `Document` is not a ground term:
`instantiation_error`

---

transform_all/3

Transforms all corpus documents into sparse vectors, preserving document order.

Compilation flags:
`static`

Template:
`transform_all(Vectorizer,Corpus,Vectors)`
Mode and number of proofs:
`transform_all(+compound,+list(list),-list(list(pair)))` - `one_or_error`

Exceptions:
`Vectorizer` is a variable:
`instantiation_error`
`Vectorizer` is neither a variable nor a valid text vectorizer:
`domain_error(text_vectorizer,Vectorizer)`
`Corpus` is a variable or a partial list:
`instantiation_error`
`Corpus` is neither a variable nor a list:
`type_error(list,Corpus)`
An element `Document` of the list `Corpus` is a variable or a partial list:

instantiation_error

An element Document of the list Corpus is neither a variable nor a list:

type_error(list,Document)

An element Feature of a document is not a ground term:

instantiation_error

---

learn_transform/3

Learns a vectorizer using default options and transforms the training corpus.

Compilation flags:

static

Template:

learn_transform(Corpus,Vectorizer,Vectors)

Mode and number of proofs:

learn_transform(+list(list),-compound,-list(list(pair)))-one_or_error

Exceptions:

Corpus is a variable or a partial list:

instantiation_error

Corpus is neither a variable nor a list:

type_error(list,Corpus)

Corpus is empty:

domain_error(non_empty_corpus,Corpus)

An element Document of the list Corpus is a variable or a partial list:

instantiation_error

An element Document of the list Corpus is neither a variable nor a list:

type_error(list,Document)

An element Feature of a document is not a ground term:

instantiation_error

No corpus feature satisfies the document-frequency filters:

domain_error(non_empty_vocabulary,Corpus)

---

learn_transform/4

Learns a vectorizer using the given options and transforms the training corpus.

Compilation flags:

static

Template:

learn_transform(Corpus,Vectorizer,Vectors,Options)

Mode and number of proofs:

`learn_transform(+list(list),-compound,-list(list(pair)),+list(compound))` - `one_or_error`

Exceptions:

`Corpus` is a variable or a partial list:
`instantiation_error`
`Corpus` is neither a variable nor a list:
`type_error(list,Corpus)`
`Corpus` is empty:
`domain_error(non_empty_corpus,Corpus)`
An element `Document` of the list `Corpus` is a variable or a partial list:
`instantiation_error`
An element `Document` of the list `Corpus` is neither a variable nor a list:
`type_error(list,Document)`
An element `Feature` of a document is not a ground term:
`instantiation_error`
`Options` is a variable:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`
The `maximum_document_frequency(Maximum)` option value is greater than the corpus document count:
`domain_error(option,maximum_document_frequency(Maximum))`
The `minimum_document_frequency(Minimum)` option value is greater than the effective maximum document frequency:
`domain_error(option,minimum_document_frequency(Minimum))`
No corpus feature satisfies the document-frequency filters:
`domain_error(non_empty_vocabulary,Corpus)`

`check_vectorizer/1`

Checks that a term is a structurally valid learned text vectorizer.

Compilation flags:
`static`

Template:
`check_vectorizer(Vectorizer)`
Mode and number of proofs:
`check_vectorizer(@compound)` - `one_or_error`

Exceptions:

`Vectorizer` is a variable:
`instantiation_error`
`Vectorizer` is neither a variable nor a valid text vectorizer:
`domain_error(text_vectorizer,Vectorizer)`

`valid_vectorizer/1`

True when a term is a structurally valid learned text vectorizer.

Compilation flags:
`static`

Template:
`valid_vectorizer(Vectorizer)`
Mode and number of proofs:
`valid_vectorizer(@compound)` - `zero_or_one`

`vocabulary/2`

Returns the learned vocabulary in standard term order.

Compilation flags:
`static`

Template:
`vocabulary(Vectorizer,Vocabulary)`
Mode and number of proofs:
`vocabulary(+compound,-list)` - `one_or_error`

Exceptions:
`Vectorizer` is a variable:
`instantiation_error`
`Vectorizer` is neither a variable nor a valid text vectorizer:
`domain_error(text_vectorizer,Vectorizer)`

---

diagnostics/2

Returns the diagnostics and metadata stored in a learned vectorizer.

Compilation flags:
`static`

Template:
`diagnostics(Vectorizer,Diagnostics)`
Mode and number of proofs:
`diagnostics(+compound,-list(compound))` - `one_or_error`

Exceptions:
`Vectorizer` is a variable:
`instantiation_error`
`Vectorizer` is neither a variable nor a valid text vectorizer:
`domain_error(text_vectorizer,Vectorizer)`

---

diagnostic/2

Tests or enumerates individual diagnostics terms stored in a learned vectorizer.

Compilation flags:
`static`

Template:
`diagnostic(Vectorizer,Diagnostic)`
Mode and number of proofs:
`diagnostic(+compound,?compound)` - `zero_or_more`

Exceptions:
`Vectorizer` is a variable:
`instantiation_error`
`Vectorizer` is neither a variable nor a valid text vectorizer:
`domain_error(text_vectorizer,Vectorizer)`

---

vectorizer_options/2

Returns the effective training options stored in a learned vectorizer.

Compilation flags:
`static`

Template:
`vectorizer_options(Vectorizer,Options)`

Mode and number of proofs:
`vectorizer_options(+compound,-list(compound))` - `one_or_error`

Exceptions:
`Vectorizer` is a variable:
`instantiation_error`
`Vectorizer` is neither a variable nor a valid text vectorizer:
`domain_error(text_vectorizer,Vectorizer)`

Public predicates

score_all/4

Scores catalog items in input order, preserving duplicates and validating the model once. An empty batch validates the model and user.

Compilation flags:
`static`

Template:
`score_all(Recommender,User,Items,Scores)`

Mode and number of proofs:

```
score_all(+compound,+atomic,+list(atomic),-list(pair)) - one_or_error
```

Exceptions:

A required argument or identifier is a variable:

```
instantiation_error
```

The model is invalid:

```
domain_error(recommender,Recommender)
```

A user or item identifier is not atomic:

```
type_error(atomic,Identifier)
```

Items is not a proper list:

```
type_error(list,Items)
```

An item is absent from the catalog:

```
domain_error(catalog_item,Item)
```

---

score_content/4

Scores supplied content of the trained representation without changing the model. Features use the fitted vocabulary and weighting; vectors use the stored normalization.

Compilation flags:

```
static
```

Template:

```
score_content(Recommender,User,Content,Score)
```

Mode and number of proofs:

```
score_content(+compound,+atomic,+compound,-number) - one_or_error
```

Exceptions:

A required argument, feature, entry, or weight is a variable:

```
instantiation_error
```

The model is invalid:

```
domain_error(recommender,Recommender)
```

User is not atomic:

```
type_error(atomic,User)
```

A content descriptor is invalid:

```
domain_error(item_content,Content)
```

The descriptor differs from the trained representation:

```
domain_error(content_representation,Content)
```

A content list is not a proper list:

```
type_error(list,List)
```

A vector entry is not a pair:

```
type_error(pair,Entry)
```

A vector repeats a feature key:

```
domain_error(duplicate_feature,Feature)
```

A vector weight is not numeric:

```
type_error(number,Weight)
```

A vector weight is negative or nonfinite:
`domain_error(non_negative_finite_weight,Weight)`

---

update_ratings/3

Returns a model with inserted or replaced ratings and rebuilt profiles, accepting new users but requiring catalog items. An empty update returns the validated original model.

Compilation flags:
`static`

Template:
`update_ratings(Recommender,Ratings,UpdatedRecommender)`

Mode and number of proofs:
`update_ratings(+compound,+list(compound),-compound)` - `one_or_error`

Exceptions:
A required argument, record, identifier, or value is a variable:
`instantiation_error`
The model is invalid:
`domain_error(recommender,Recommender)`
Ratings is not a proper list:
`type_error(list,Ratings)`
An entry is not a rating record:
`type_error(rating,Entry)`
A user or item identifier is not atomic:
`type_error(atomic,Identifier)`
A rating value is not numeric:
`type_error(number,Rating)`
A rating value is nonfinite:
`domain_error(finite_rating,Rating)`
A rating value is outside the stored scale:
`domain_error(rating_scale(Min,Max),Rating)`
An item is absent from the catalog:
`domain_error(catalog_item,Item)`
A user-item pair occurs more than once in the updates:
`domain_error(duplicate_rating,User-Item)`
A selected rating is not positive in rating-weighted mode:
`domain_error(positive_rating_weight,Rating)`

---

remove_ratings/3

Returns a model with requested ratings removed and profiles rebuilt. Missing and repeated pairs are accepted; no matching ratings returns the validated original model.

Compilation flags:

`static`

Template:

`remove_ratings(Recommender,UserItemPairs,UpdatedRecommender)`

Mode and number of proofs:

`remove_ratings(+compound,+list(pair),-compound)` - `one_or_error`

Exceptions:

A required argument, entry, or identifier is a variable:

`instantiation_error`

The model is invalid:

`domain_error(recommender,Recommender)`

UserItemPairs is not a proper list:

`type_error(list,UserItemPairs)`

An entry is not a pair:

`type_error(pair,Entry)`

A user or item identifier is not atomic:

`type_error(atomic,Identifier)`

No ratings would remain:

`domain_error(non_empty_ratings,[])`

A selected rating is not positive in rating-weighted mode:

`domain_error(positive_rating_weight,Rating)`

---

extend_catalog/3

Returns a model with new catalog items, refitting the full feature corpus and rebuilding profiles. An empty extension returns the validated original model.

Compilation flags:

`static`

Template:

`extend_catalog(Recommender,ItemContents,UpdatedRecommender)`

Mode and number of proofs:

`extend_catalog(+compound,+list(pair),-compound)` - `one_or_error`

Exceptions:

A required argument, entry, identifier, feature, or weight is a variable:

`instantiation_error`

The model is invalid:

`domain_error(recommender,Recommender)`

A supplied list is not a proper list:
`type_error(list,List)`
A content declaration or vector entry is not a pair:
`type_error(pair,Entry)`
An item identifier is not atomic:
`type_error(atomic,Item)`
An identifier already belongs to the catalog:
`domain_error(new_catalog_item,Item)`
An identifier occurs more than once in the extension:
`domain_error(duplicate_item,Item)`
A content descriptor is invalid:
`domain_error(item_content,Content)`
Content representations are mixed or differ from the catalog:
`domain_error(content_representation,Content)`
A vector repeats a feature key:
`domain_error(duplicate_feature,Feature)`
A vector weight is not numeric:
`type_error(number,Weight)`
A vector weight is negative or nonfinite:
`domain_error(non_negative_finite_weight,Weight)`
Feature fitting produces no vocabulary:
`domain_error(non_empty_vocabulary,Corpus)`
A vectorizer frequency bound is inconsistent with the corpus:
`domain_error(option,Option)`
A selected rating is not positive in rating-weighted mode:
`domain_error(positive_rating_weight,Rating)`

---

replace_content/3

Returns a model with replaced catalog content, refitting the full feature corpus and rebuilding profiles. An empty replacement returns the validated original model.

Compilation flags:
`static`

Template:
`replace_content(Recommender,ItemContents,UpdatedRecommender)`
Mode and number of proofs:
`replace_content(+compound,+list(pair),-compound)` - `one_or_error`

Exceptions:
A required argument, entry, identifier, feature, or weight is a variable:
`instantiation_error`
The model is invalid:
`domain_error(recommender,Recommender)`
A supplied list is not a proper list:
`type_error(list,List)`

A content declaration or vector entry is not a pair:
`type_error(pair,Entry)`
An item identifier is not atomic:
`type_error(atomic,Item)`
An item is absent from the catalog:
`domain_error(catalog_item,Item)`
An identifier occurs more than once in the replacements:
`domain_error(duplicate_item,Item)`
A content descriptor is invalid:
`domain_error(item_content,Content)`
Content representations are mixed or differ from the catalog:
`domain_error(content_representation,Content)`
A vector repeats a feature key:
`domain_error(duplicate_feature,Feature)`
A vector weight is not numeric:
`type_error(number,Weight)`
A vector weight is negative or nonfinite:
`domain_error(non_negative_finite_weight,Weight)`
Feature fitting produces no vocabulary:
`domain_error(non_empty_vocabulary,Corpus)`
A vectorizer frequency bound is inconsistent with the corpus:
`domain_error(option,Option)`
A selected rating is not positive in rating-weighted mode:
`domain_error(positive_rating_weight,Rating)`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

`check_content_kind/3`

Checks that supplied content matches the stored representation.

Compilation flags:
`static`

Template:
`check_content_kind(Kind,Content,Diagnostics)`
Mode and number of proofs:
`check_content_kind(+atom,+compound,+list(compound))` - `one_or_error`

Exceptions:
The descriptor differs from the trained representation:
`domain_error(content_representation,Content)`

---

check_catalog_replacements/2

Checks that replacement declarations have atomic catalog identifiers.

Compilation flags:

```
static
```

Template:

```
check_catalog_replacements(ItemContents,Contents)
```

Mode and number of proofs:

```
check_catalog_replacements(+list(pair),+list(pair)) - one_or_error
```

Exceptions:

An entry or identifier is a variable:

```
instantiation_error
```

An entry is not a pair:

```
type_error(pair,Entry)
```

An identifier is not atomic:

```
type_error(atomic,Item)
```

An identifier is absent from the catalog:

```
domain_error(catalog_item,Item)
```

---

check_catalog_additions/2

Checks that content declarations have atomic identifiers absent from the catalog.

Compilation flags:

```
static
```

Template:

```
check_catalog_additions(ItemContents,Contents)
```

Mode and number of proofs:

```
check_catalog_additions(+list(pair),+list(pair)) - one_or_error
```

Exceptions:

An entry or identifier is a variable:

```
instantiation_error
```

An entry is not a pair:

```
type_error(pair,Entry)
```

An identifier is not atomic:

```
type_error(atomic,Item)
```

An identifier already belongs to the catalog:

```
domain_error(new_catalog_item,Item)
```

---

rebuild_catalog_model/5

Rebuilds the full catalog fitted state, profiles, and diagnostics using the stored options.

Compilation flags:

```
static
```

Template:

```
rebuild_catalog_model(Ratings,Contents,Scale,Diagnostics,UpdatedRecommender)
```

Mode and number of proofs:

```
rebuild_catalog_model(+list(compound),+list(pair),+term,+list(compound),
-compound) - one_or_error
```

Exceptions:

Feature fitting produces no vocabulary:

```
domain_error(non_empty_vocabulary,Corpus)
```

A vectorizer frequency bound is inconsistent with the corpus:

```
domain_error(option,Option)
```

Vectorizer options are supplied for preweighted content:

```
domain_error(option,vectorizer_options(Options))
```

A selected rating is not positive in rating-weighted mode:

```
domain_error(positive_rating_weight,Rating)
```

---

rating_removal_records/3

Validates user-item pairs and collects matching stored ratings, ignoring missing pairs.

Compilation flags:

```
static
```

Template:

```
rating_removal_records(UserItemPairs,Ratings,Removals)
```

Mode and number of proofs:

```
rating_removal_records(+list(pair),+list(compound),-list(compound)) - one_or_error
```

Exceptions:

An entry or identifier is a variable:

```
instantiation_error
```

An entry is not a pair:

```
type_error(pair,Entry)
```

A user or item identifier is not atomic:

```
type_error(atomic,Identifier)
```

---

check_rating_updates/3

Checks rating records against the catalog and stored rating scale.

Compilation flags:

```
static
```

Template:

```
check_rating_updates(Ratings,Vectors,Scale)
```

Mode and number of proofs:

```
check_rating_updates(+list(compound),+list(pair),+term) - one_or_error
```

Exceptions:

A record, identifier, or value is a variable:

```
instantiation_error
```

An entry is not a rating record:

```
type_error(rating,Entry)
```

A user or item identifier is not atomic:

```
type_error(atomic,Identifier)
```

A rating value is not numeric:

```
type_error(number,Rating)
```

A rating value is nonfinite:

```
domain_error(finite_rating,Rating)
```

A rating value is outside the stored scale:

```
domain_error(rating_scale(Min,Max),Rating)
```

An item is absent from the catalog:

```
domain_error(catalog_item,Item)
```

---

rebuild_feedback_model/7

Rebuilds profiles and diagnostics while retaining the fitted catalog state.

Compilation flags:

```
static
```

Template:

```
rebuild_feedback_model(Ratings,Contents,Vectors,Vectorizer,Scale,Diagnostics,
UpdatedRecommender)
```

Mode and number of proofs:

```
rebuild_feedback_model(+list(compound),+list(pair),+list(pair),+term,+term,
+list(compound),-compound) - one_or_error
```

Exceptions:

A selected rating is not positive in rating-weighted mode:

```
domain_error(positive_rating_weight,Rating)
```

---

catalog_score/5

Scores a catalog identifier using validated model data.

Compilation flags:
`static`

Template:
`catalog_score(Vectors,Profiles,User,Item,Score)`
Mode and number of proofs:
`catalog_score(+list(pair),+list(pair),+atomic,+atomic,-number)` - `one_or_error`

Exceptions:
An item is absent from the catalog:
`domain_error(catalog_item,Item)`

---

score_catalog_items/5

Validates and scores catalog identifiers in input order using validated model data.

Compilation flags:
`static`

Template:
`score_catalog_items(Vectors,Profiles,User,Items,Scores)`
Mode and number of proofs:
`score_catalog_items(+list(pair),+list(pair),+atomic,+list(atomic),-list(pair))` - `one_or_error`

Exceptions:
An identifier is a variable:
`instantiation_error`
An identifier is not atomic:
`type_error(atomic,Item)`
An item is absent from the catalog:
`domain_error(catalog_item,Item)`

---

check_finite_ratings/1

Checks that rating values are finite.

Compilation flags:
`static`

Template:

```
check_finite_ratings(Ratings)
```

Mode and number of proofs:

```
check_finite_ratings(+list(compound)) - one_or_error
```

Exceptions:

A rating is not finite:

```
domain_error(finite_rating,Rating)
```

---

build_vectors/5

Fits catalog feature vectors or normalizes supplied vectors using the effective options.

Compilation flags:

```
static
```

Template:

```
build_vectors(Kind,Contents,Options,Vectorizer,Vectors)
```

Mode and number of proofs:

```
build_vectors(+atom,+list(pair),+list(compound),-term,-list(pair)) - one_or_error
```

Exceptions:

Feature fitting produces no vocabulary:

```
domain_error(non_empty_vocabulary,Corpus)
```

A vectorizer frequency bound is inconsistent with the corpus:

```
domain_error(option,Option)
```

Vectorizer options are supplied for preweighted content:

```
domain_error(option,vectorizer_options(Options))
```

---

profile_weights/3

Assigns uniform or strictly positive raw-rating weights to selected item vectors.

Compilation flags:

```
static
```

Template:

```
profile_weights(Selected,Weighting,Weighted)
```

Mode and number of proofs:

```
profile_weights(+list(pair),+atom,-list(pair)) - one_or_error
```

Exceptions:

A selected rating is not positive in rating-weighted mode:

```
domain_error(positive_rating_weight,Rating)
```

Operators

1.320 theta_forecasting

object

1.320.1 `theta_forecasting`

Standard Theta forecasting combining simple exponential smoothing and linear trend extrapolation.

Availability:
`logtalk_load(theta_forecasting(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-14

Compilation flags:
`static, context_switching_calls`

Imports:
`public` *forecaster_common*
`public` *exponential_smoothing_common*

Uses:
format
list
nelder_mead(Problem)
numberlist
type

Remarks:
(none)

Inherited public predicates:

Public predicates

fitted_values/2

Returns aligned SES training fits on the original scale using default options. Missing targets and the first known initialization anchor have independent unbound placeholders. These are not prefix-wise Theta forecasts.

Compilation flags:

```
static
```

Template:

```
fitted_values(Dataset,Values)
```

Mode and number of proofs:

```
fitted_values(+object_identifier,-list) - one_or_error
```

Exceptions:

A length or frequency is unbound:

```
instantiation_error
```

An observation is not numeric:

```
type_error(number,Observation)
```

The declared length is not an integer:

```
type_error(integer,DeclaredLength)
```

The declared length is not positive:

```
domain_error(positive_integer,DeclaredLength)
```

The dataset has no observations:

```
domain_error(non_empty_series,Dataset)
```

Indices are not gap-free and 1-based:

```
domain_error(series_index_sequence,Dataset)
```

Declared and observed lengths differ:

```
consistency_error(series_length,DeclaredLength,ObservedLength)
```

There are fewer than two observations:

```
domain_error(series_length,Dataset)
```

There are fewer than two known observations:

```
domain_error(insufficient_known_observations,Dataset)
```

The dataset frequency is not an integer:

```
type_error(integer,Frequency)
```

The dataset frequency is not positive:

```
domain_error(positive_integer,Frequency)
```

Seasonal decomposition has fewer than two cycles:

```
domain_error(series_length,Series)
```

A seasonal phase has no valid centered-window deviation:

```
domain_error(insufficient_seasonal_phase_observations,Phase)
```

Multiplicative factors are not positive:

```
domain_error(positive_number,Value)
```

The residual count is inconsistent:

```
domain_error(residual_count,Residuals)
```

Fitting or fit restoration arithmetic fails:

```
evaluation_error(Error)
```

---

fitted_values/3

Returns aligned SES training fits on the original scale using the learning options. Missing targets and the first known initialization anchor have independent unbound placeholders. Parameters and seasonal factors are fitted once using the full sample, not individual prefixes.

Compilation flags:

```
static
```

Template:

```
fitted_values(Dataset,Values,Options)
```

Mode and number of proofs:

```
fitted_values(+object_identifier,-list,+list(compound))-one_or_error
```

Exceptions:

An option, length, or strict-policy observation is unbound:

```
instantiation_error
```

Options are not a list:

```
type_error(list,Options)
```

An option is not a compound term:

```
type_error(compound,Option)
```

An option is invalid:

```
domain_error(option,Option)
```

An observation is not numeric:

```
type_error(number,Observation)
```

The declared length is not an integer:

```
type_error(integer,DeclaredLength)
```

The declared length is not positive:

```
domain_error(positive_integer,DeclaredLength)
```

The dataset has no observations:

```
domain_error(non_empty_series,Dataset)
```

Indices are not gap-free and 1-based:

```
domain_error(series_index_sequence,Dataset)
```

Declared and observed lengths differ:

```
consistency_error(series_length,DeclaredLength,ObservedLength)
```

There are fewer than two observations:

```
domain_error(series_length,Dataset)
```

There are fewer than two known observations:

```
domain_error(insufficient_known_observations,Dataset)
```

The frequency is not an integer:

```
type_error(integer,Frequency)
```

The frequency is not positive:

```
domain_error(positive_integer,Frequency)
```

Forced seasonality needs a frequency greater than one:

```
domain_error(seasonal_frequency,Frequency)
```

Forced seasonality has no dataset frequency:

```
domain_error(seasonal_frequency,Dataset)
```

An explicit frequency accompanies no seasonality:

```
domain_error(theta_forecasting_option,Option)
```

The series has fewer than two seasonal cycles:

```
domain_error(series_length,Series)
```

A seasonal phase has no valid centered-window deviation:

```
domain_error(insufficient_seasonal_phase_observations,Phase)
```

Multiplicative data or factors are not positive:

```
domain_error(positive_number,Value)
```

The residual count is inconsistent:

```
domain_error(residual_count,Residuals)
```

Fitting or fit restoration arithmetic fails:

```
evaluation_error(Error)
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

prepare_learning/4

Collects and fits once, returning transient adjusted observations and residuals alongside the forecaster.

Compilation flags:

```
static
```

Template:

```
prepare_learning(Dataset,Forecaster,FitData,Options)
```

Mode and number of proofs:

`prepare_learning(+object_identifier,-compound,-compound,+list(compound))` - one_or_error

Exceptions:

An option, length, or strict-policy observation is unbound:
`instantiation_error`
Options are not a list:
`type_error(list,Options)`
An option is not a compound term:
`type_error(compound,Option)`
An option is invalid:
`domain_error(option,Option)`
An observation is not numeric:
`type_error(number,Observation)`
The declared length is not an integer:
`type_error(integer,DeclaredLength)`
The declared length is not positive:
`domain_error(positive_integer,DeclaredLength)`
The dataset has no observations:
`domain_error(non_empty_series,Dataset)`
Indices are not gap-free and 1-based:
`domain_error(series_index_sequence,Dataset)`
Declared and observed lengths differ:
`consistency_error(series_length,DeclaredLength,ObservedLength)`
There are fewer than two observations:
`domain_error(series_length,Dataset)`
There are fewer than two known observations:
`domain_error(insufficient_known_observations,Dataset)`
The frequency is not an integer:
`type_error(integer,Frequency)`
The frequency is not positive:
`domain_error(positive_integer,Frequency)`
Forced seasonality needs a frequency greater than one:
`domain_error(seasonal_frequency,Frequency)`
Forced seasonality has no dataset frequency:
`domain_error(seasonal_frequency,Dataset)`
An explicit frequency accompanies no seasonality:
`domain_error(theta_forecasting_option,Option)`
The series has fewer than two seasonal cycles:
`domain_error(series_length,Series)`
A seasonal phase has no valid centered-window deviation:
`domain_error(insufficient_seasonal_phase_observations,Phase)`
Multiplicative data or factors are not positive:
`domain_error(positive_number,Value)`
Fitting arithmetic fails:
`evaluation_error(Error)`

prepare_seasonality/8

Resolves the requested seasonal adjustment and dataset frequency.

Compilation flags:

```
static
```

Template:

```
prepare_seasonality(Dataset,Series,UserOptions,Options,Adjusted,Seasonality,Mode,
Frequency)
```

Mode and number of proofs:

```
prepare_seasonality(+object_identifier,+list,+list,+list,-list,-term,-atom,
-integer) - one_or_error
```

Exceptions:

The frequency is unbound:

```
instantiation_error
```

The frequency is not an integer:

```
type_error(integer,Frequency)
```

The frequency is not positive:

```
domain_error(positive_integer,Frequency)
```

Forced seasonality has no dataset frequency:

```
domain_error(seasonal_frequency,Dataset)
```

Forced seasonality has frequency one:

```
domain_error(seasonal_frequency,Frequency)
```

A frequency option is supplied with no seasonality:

```
domain_error(theta_forecasting_option,Option)
```

The series has fewer than two cycles:

```
domain_error(series_length,Series)
```

A seasonal phase has no valid centered-window deviation:

```
domain_error(insufficient_seasonal_phase_observations,Phase)
```

Multiplicative data or factors are not positive:

```
domain_error(positive_number,Value)
```

Seasonal arithmetic fails:

```
evaluation_error(Error)
```

---

positive_series/1

Checks whether all known numeric observations are strictly positive, ignoring unbound observations.

Compilation flags:

```
static
```

Template:

```
positive_series(Series)
```

Mode and number of proofs:

```
positive_series(+list) - zero_or_one
```

Exceptions:

Numeric comparison fails:

```
evaluation_error(Error)
```

---

training_totals/6

Scores SES training fits after restoring the original seasonal scale and returns the same compact scoring errors.

Compilation flags:

```
static
```

Template:

```
training_totals(Series,Adjusted,Seasonality,Errors,Totals,OriginalErrors)
```

Mode and number of proofs:

```
training_totals(+list,+list,+term,+compound,-compound,-list(number)) -
one_or_error
```

Exceptions:

Training-error arithmetic fails:

```
evaluation_error(Error)
```

---

score_seasonal/9

Scores known targets on their original scale, advancing phases but not residuals at gaps.

Compilation flags:

```
static
```

Template:

```
score_seasonal(Actuals,Adjusted,Residuals,Method,Factors,Cycle,Totals0,Totals,
OriginalErrors)
```

Mode and number of proofs:

```
score_seasonal(+list,+list,+list(number),+atom,+list(number),+list(number),
+compound,-compound,-list(number)) - one_or_error
```

Exceptions:

Fit restoration or error accumulation fails:

```
evaluation_error(Error)
```

---

anchor_series/2

Removes only leading missing positions before fitting the SES initialization anchor.

Compilation flags:

```
static
```

Template:

```
anchor_series(Series,FitSeries)
```

Mode and number of proofs:

```
anchor_series(+list,-list) - one
```

---

fit_level/13

Fits the SES level using the existing bounded optimization problem when needed.

Compilation flags:

```
static
```

Template:

```
fit_level(Series,RequestedAlpha,Initialization,OptimizerOptions,Alpha,
InitialLevel,Level,SSE,Errors,Fitting,Convergence,Iterations,Evaluations)
```

Mode and number of proofs:

```
fit_level(+compound,+term,+atom,+list,-number,-number,-number,-compound,
-atom,-atom,-integer,-integer) - one_or_error
```

Exceptions:

Optimizer options are invalid:

```
domain_error(option,Option)
```

Fitting arithmetic fails:

```
evaluation_error(Error)
```

---

theta_correction/3

Computes the finite-sample correction, including the zero-alpha limit.

Compilation flags:

```
static
```

Template:

```
theta_correction(Length,Alpha,Correction)
```

Mode and number of proofs:

```
theta_correction(+positive_integer,+number,-number) - one_or_error
```

Exceptions:

Correction arithmetic fails:
`evaluation_error(Error)`

---

correction_steps/4

Evaluates the geometric correction through a stable recurrence.

Compilation flags:
`static`

Template:
`correction_steps(Remaining,Weight,Previous,Correction)`
Mode and number of proofs:
`correction_steps(+non_negative_integer,+number,+number,-number)` - `one_or_error`

Exceptions:
Correction arithmetic fails:
`evaluation_error(Error)`

---

residual_totals/3

Accumulates training residual error totals.

Compilation flags:
`static`

Template:
`residual_totals(Residuals,Totals0,Totals)`
Mode and number of proofs:
`residual_totals(+list(number),+compound,-compound)` - `one_or_error`

Exceptions:
Error accumulation fails:
`evaluation_error(Error)`

---

valid_model/1

Validates ground state and mandatory diagnostics.

Compilation flags:
`static`

Template:

```
valid_model(Forecaster)
```

Mode and number of proofs:

```
valid_model(+compound) - zero_or_one
```

Exceptions:

Validation arithmetic fails:

```
evaluation_error(Error)
```

---

valid_seasonality/4

Validates retained seasonal factors and next forecast phase.

Compilation flags:

```
static
```

Template:

```
valid_seasonality(Seasonality,Length,Mode,Frequency)
```

Mode and number of proofs:

```
valid_seasonality(+term,+positive_integer,?atom,?positive_integer) - zero_or_one
```

Exceptions:

Phase arithmetic fails:

```
evaluation_error(Error)
```

---

valid_fitting/2

Validates fitting provenance and optimizer counters.

Compilation flags:

```
static
```

Template:

```
valid_fitting(Initialization,Diagnostics)
```

Mode and number of proofs:

```
valid_fitting(+atom,+list(compound)) - zero_or_one
```

Exceptions:

Counter comparison fails:

```
evaluation_error(Error)
```

Operators

(none)

1.321 thurstone_mosteller_ranker

object

1.321.1 `thurstone_mosteller_ranker`

Thurstone-Mosteller Case V pairwise preference ranker. Learns one real-valued latent utility per item from a dataset object implementing the `pairwise_ranking_dataset_protocol` protocol by fitting continuity-corrected empirical paired-comparison probabilities with a deterministic weighted least-squares normal model, and returns a self-describing ranker term with diagnostics that can be used for ranking and export.

Availability:
`logtalk_load(thurstone_mosteller_ranker(loader))`

Author: Paulo Moura
Version: 1:1:0
Date: 2026-08-11

Compilation flags:

1.322 time_scales

object

1.322.1 `time_scales`

Time scale conversions for UTC, TAI, TT, UT1, TDB, GPS, GST, TCG, and TCB using bundled and optional override data.

Availability:

```
logtalk_load(time_scales(loader))
```

Author: Paulo Moura
Version: 1:0:1
Date: 2026-04-07

Compilation flags:

```
static, context_switching_calls
```

Implements:

`public` *time_scales_protocol*

Uses:

date
time_scales_data

Remarks:

- Supported UTC range: From 1972-01-01T00:00:00Z onwards.
- Time representation: Instants are represented as `instant(Scale,Seconds,fraction(Numerator,Denominator))` with normalized fractional part in the `[0,1[` interval.

Inherited public predicates:

check_conversion/3 *check_convert/4* *check_instant/1* *check_offset/3* *clear_dut1_override/0* *clear_leap_seconds_override/0* *convert/4* *dut1_entries/1* *dut1_source/1* *instant_to_utc_date_time/2* *leap_second_date/2* *leap_seconds_entries/1* *leap_seconds_source/1* *load_dut1_override/1* *load_leap_seconds_override/1* *offset/3* *save_dut1_entries/1* *save_leap_seconds_entries/1* *supported_range/2* *utc_date_time_to_instant/2* *valid_conversion/3* *valid_instant/1* *valid_scale/1*

Public predicates

load_leap_seconds_override/1

Loads leap-second override data from a file containing `leap(UnixSeconds,OffsetSeconds).` terms.

Compilation flags:
`static`

Template:
`load_leap_seconds_override(File)`
Mode and number of proofs:
`load_leap_seconds_override(+atom)` - `one`

Remarks:

- Term format: Each term must be of the form `leap(UnixSeconds,OffsetSeconds).`.
- Term ordering: Terms must be sorted by increasing `UnixSeconds`.
- Value constraints: `UnixSeconds` must be an integer greater than or equal to `63072000` and `OffsetSeconds` must be a non-decreasing integer sequence.

---

clear_leap_seconds_override/0

Clears leap-second override data and reverts to bundled data.

Compilation flags:
`static`

Mode and number of proofs:
`clear_leap_seconds_override` - `one`

---

leap_seconds_source/1

Returns the active leap-seconds data source as `bundled` or `override`.

Compilation flags:
`static`

Template:
`leap_seconds_source(Source)`
Mode and number of proofs:
`leap_seconds_source(-atom)` - `one`

---

leap_seconds_entries/1

Returns the active leap-seconds data as an ordered list of `leap(UnixSeconds,OffsetSeconds)` terms.

Compilation flags:
`static`

Template:
`leap_seconds_entries(Entries)`
Mode and number of proofs:
`leap_seconds_entries(-list)` - `one`

---

save_leap_seconds_entries/1

Saves the active leap-seconds data to a file using `leap(UnixSeconds,OffsetSeconds).` terms.

Compilation flags:
`static`

Template:
`save_leap_seconds_entries(File)`
Mode and number of proofs:
`save_leap_seconds_entries(+atom)` - `one`

---

load_dut1_override/1

Loads DUT1 override data from a file containing `dut1(UnixSeconds,Numerator,Denominator).` terms.

Compilation flags:
`static`

Template:
`load_dut1_override(File)`
Mode and number of proofs:
`load_dut1_override(+atom)` - `one`

Remarks:

- Term format: Each term must be of the form `dut1(UnixSeconds,Numerator,Denominator).`.
- Term ordering: Terms must be sorted by increasing `UnixSeconds`.
- Value constraints: `UnixSeconds` and `Numerator` must be integers; `Denominator` must be a positive integer; `UnixSeconds` must be greater than or equal to `63072000`.

---

clear_dut1_override/0

Clears DUT1 override data and reverts to bundled data.

Compilation flags:
`static`

Mode and number of proofs:
`clear_dut1_override` - `one`

---

dut1_source/1

Returns the active DUT1 data source as `bundled` or `override`.

Compilation flags:
`static`

Template:
`dut1_source(Source)`
Mode and number of proofs:
`dut1_source(-atom)` - `one`

---

dut1_entries/1

Returns the active DUT1 data as an ordered list of `dut1(UnixSeconds,Numerator,Denominator)` terms.

Compilation flags:
`static`

Template:
`dut1_entries(Entries)`
Mode and number of proofs:
`dut1_entries(-list)` - `one`

---

save_dut1_entries/1

Saves the active DUT1 data to a file using `dut1(UnixSeconds,Numerator,Denominator).` terms.

Compilation flags:
`static`

Template:
`save_dut1_entries(File)`

Mode and number of proofs:
`save_dut1_entries(+atom)` - `one`

`leap_offset_at_utc_unix/2`

Returns the `TAI-UTC` offset in SI seconds for a given UTC Unix epoch second within the supported range.

Compilation flags:
`static`

Template:
`leap_offset_at_utc_unix(UnixSeconds,OffsetSeconds)`
Mode and number of proofs:
`leap_offset_at_utc_unix(+integer,-integer)` - `zero_or_one`

`leap_effective_date/2`

Enumerates UTC effective dates for `TAI-UTC` offset changes and their resulting offset in SI seconds.

Compilation flags:
`static`

Template:
`leap_effective_date(UTCDateTime,OffsetSeconds)`
Mode and number of proofs:
`leap_effective_date(?compound,?integer)` - `zero_or_more`

`tt_minus_tai/2`

Returns the constant TT minus TAI offset as a rational value `Numerator/Denominator` seconds.

Compilation flags:
`static`

Template:
`tt_minus_tai(Numerator,Denominator)`
Mode and number of proofs:
`tt_minus_tai(-integer,-integer)` - `one`

---

dut1_offset_at_utc_unix/3

Returns DUT1 (UT1−UTC) at a UTC Unix epoch second as a rational value Numerator/Denominator.

Compilation flags:
static

Template:
dut1_offset_at_utc_unix(UnixSeconds,Numerator,Denominator)
Mode and number of proofs:
dut1_offset_at_utc_unix(+integer,-integer,-integer) - zero_or_one

---

tdb_minus_tt_approx/3

Returns an approximate TDB−TT offset in seconds for a TT instant represented by integer seconds and normalized fraction.

Compilation flags:
static

Template:
tdb_minus_tt_approx(TTSeconds,Fraction,OffsetSeconds)
Mode and number of proofs:
tdb_minus_tt_approx(+integer,+compound,-float) - one

---

tcg_minus_tt_approx/3

Returns an approximate TCG−TT offset in seconds for a TT instant represented by integer seconds and normalized fraction.

Compilation flags:
static

Template:
tcg_minus_tt_approx(TTSeconds,Fraction,OffsetSeconds)
Mode and number of proofs:
tcg_minus_tt_approx(+integer,+compound,-float) - one

---

tcb_minus_tdb_approx/3

Returns an approximate `TCB-TDB` offset in seconds for a TDB instant represented by integer seconds and normalized fraction.

Compilation flags:
`static`

Template:
`tcb_minus_tdb_approx(TDBSeconds,Fraction,OffsetSeconds)`
Mode and number of proofs:
`tcb_minus_tdb_approx(+integer,+compound,-float)` - `one`

---

tai_minus_utc_for_tai_unix/2

Returns the `TAI-UTC` offset in SI seconds for a given TAI instant represented as Unix-like integer seconds.

Compilation flags:
`static`

Template:
`tai_minus_utc_for_tai_unix(TAISeconds,OffsetSeconds)`
Mode and number of proofs:
`tai_minus_utc_for_tai_unix(+integer,-integer)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

leap_override_data_/2

Table of leap seconds override data.

Compilation flags:
`dynamic`

Template:
`leap_override_data_(UnixStart,OffsetSeconds)`
Mode and number of proofs:
`leap_override_data_(?integer,?integer)` - `zero_or_more`

---

dut1_override_data_/3

Table of DUT1 override data.

Compilation flags:
`dynamic`

Template:
`dut1_override_data_(UnixStart,Numerator,Denominator)`
Mode and number of proofs:
`dut1_override_data_(?integer,?integer,?integer)` - `zero_or_more`

---

leap_source_/1

Source of leap seconds data (either `override` or `bundled`).

Compilation flags:
`dynamic`

Template:
`leap_source_(Source)`
Mode and number of proofs:
`leap_source_(?atom)` - `zero_or_one`

---

dut1_source_/1

Source of DUT1 data (either `override` or `bundled`).

Compilation flags:
`dynamic`

Template:
`dut1_source_(Source)`
Mode and number of proofs:
`dut1_source_(?atom)` - `zero_or_one`

Operators

(none)
protocol

1.322.3 `time_scales_protocol`

Time scales conversion protocol for UTC, TAI, TT, UT1, TDB, GPS, GST, TCG, and TCB.

Public predicates

valid_scale/1

True when the argument is a supported time scale (`utc`, `tai`, `tt`, `ut1`, `tdb`, `gps`, `gst`, `tcg`, or `tcb`).

Compilation flags:
`static`

Template:
`valid_scale(Scale)`
Mode and number of proofs:
`valid_scale(@atom)` - `zero_or_one`

---

supported_range/2

Returns the supported UTC datetime range as `date_time(Year,Month,Day,Hour,Minute,Second)` terms.

Compilation flags:
`static`

Template:
`supported_range(StartUTC,EndUTC)`
Mode and number of proofs:
`supported_range(-compound,-compound)` - `one`

---

leap_second_date/2

Enumerates UTC effective dates for `TAI-UTC` step changes and their resulting offset in SI seconds.

Compilation flags:
`static`

Template:
`leap_second_date(UTCDateTime,OffsetSeconds)`

Mode and number of proofs:

`leap_second_date(?compound,?integer)` - `zero_or_more`

---

load_leap_seconds_override/1

Loads leap-second override data from a user-provided file containing `leap(UnixSeconds,OffsetSeconds).` terms.

Compilation flags:

`static`

Template:

`load_leap_seconds_override(File)`

Mode and number of proofs:

`load_leap_seconds_override(+atom)` - `one`

---

clear_leap_seconds_override/0

Clears any previously loaded leap-second override data and reverts to bundled data.

Compilation flags:

`static`

Mode and number of proofs:

`clear_leap_seconds_override` - `one`

---

leap_seconds_source/1

Returns the active leap-seconds data source as either `bundled` or `override`.

Compilation flags:

`static`

Template:

`leap_seconds_source(Source)`

Mode and number of proofs:

`leap_seconds_source(-atom)` - `one`

---

leap_seconds_entries/1

Returns the active leap-seconds table as an ordered list of `leap(UnixSeconds,OffsetSeconds)` terms.

Compilation flags:
`static`

Template:
`leap_seconds_entries(Entries)`
Mode and number of proofs:
`leap_seconds_entries(-list)` - `one`

---

save_leap_seconds_entries/1

Saves the active leap-seconds table to a file as `leap(UnixSeconds,OffsetSeconds).` terms.

Compilation flags:
`static`

Template:
`save_leap_seconds_entries(File)`
Mode and number of proofs:
`save_leap_seconds_entries(+atom)` - `one`

---

load_dut1_override/1

Loads DUT1 override data from a user-provided file containing `dut1(UnixSeconds,Numerator,Denominator).` terms.

Compilation flags:
`static`

Template:
`load_dut1_override(File)`
Mode and number of proofs:
`load_dut1_override(+atom)` - `one`

---

clear_dut1_override/0

Clears any previously loaded DUT1 override data and reverts to bundled data.

Compilation flags:
`static`

Mode and number of proofs:
`clear_dut1_override` - `one`

---

dut1_source/1

Returns the active DUT1 data source as either `bundled` or `override`.

Compilation flags:
`static`

Template:
`dut1_source(Source)`
Mode and number of proofs:
`dut1_source(-atom)` - `one`

---

dut1_entries/1

Returns the active DUT1 table as an ordered list of `dut1(UnixSeconds,Numerator,Denominator)` terms.

Compilation flags:
`static`

Template:
`dut1_entries(Entries)`
Mode and number of proofs:
`dut1_entries(-list)` - `one`

---

save_dut1_entries/1

Saves the active DUT1 table to a file as `dut1(UnixSeconds,Numerator,Denominator).` terms.

Compilation flags:
`static`

Template:
`save_dut1_entries(File)`

Mode and number of proofs:
`save_dut1_entries(+atom)` - `one`

---

utc_date_time_to_instant/2

Converts a UTC datetime term to an instant represented as `instant(utc,Seconds,fraction(Numerator,Denominator))` where `Seconds` are Unix epoch seconds and the fractional component is normalized.

Compilation flags:
`static`

Template:
`utc_date_time_to_instant(UTCDateTime,Instant)`
Mode and number of proofs:
`utc_date_time_to_instant(+compound,-compound)` - `zero_or_one`

---

valid_instant/1

True when the argument is a valid supported instant term `instant(Scale,Seconds,fraction(Numerator,Denominator))`.

Compilation flags:
`static`

Template:
`valid_instant(Instant)`
Mode and number of proofs:
`valid_instant(+compound)` - `zero_or_one`

---

check_instant/1

Checks an instant term and throws an error instead of failing on invalid input.

Compilation flags:
`static`

Template:
`check_instant(Instant)`
Mode and number of proofs:
`check_instant(+compound)` - `one_or_error`

Exceptions:

`Instant` is a variable:
```
instantiation_error
```
`Instant` is not a valid instant term:
```
domain_error(instant,Instant)
```
`Scale` in `Instant` is neither a variable nor an atom:
```
type_error(atom,Scale)
```
`Scale` in `Instant` is not supported:
```
domain_error(time_scale,Scale)
```
`Seconds` in `Instant` is neither a variable nor an integer:
```
type_error(integer,Seconds)
```
`Seconds` in `Instant` is before supported UTC epoch:
```
domain_error(utc_unix_seconds,Seconds)
```
Fraction term in `Instant` is not of the form `fraction(Numerator,Denominator)`:
```
domain_error(fraction,Fraction)
```
`Numerator` in `Instant` is neither a variable nor an integer:
```
type_error(integer,Numerator)
```
`Denominator` in `Instant` is neither a variable nor an integer:
```
type_error(integer,Denominator)
```
`Denominator` in `Instant` is not positive:
```
domain_error(positive_denominator,Denominator)
```
Normalized fraction in `Instant` is not in the `[0,1[` interval:
```
domain_error(normalized_fraction,Fraction)
```

---

valid_conversion/3

True when an instant is valid for `FromScale` and conversion to `ToScale` is admissible.

Compilation flags:
```
static
```

Template:
```
valid_conversion(Instant,FromScale,ToScale)
```
Mode and number of proofs:
```
valid_conversion(+compound,+atom,+atom) - zero_or_one
```

---

check_conversion/3

Checks a conversion request and throws an error instead of failing on invalid input.

Compilation flags:
```
static
```

Template:
```
check_conversion(Instant,FromScale,ToScale)
```
Mode and number of proofs:

`check_conversion(+compound,+atom,+atom)` - `one_or_error`

Exceptions:

`Instant`, `FromScale`, or `ToScale` is a variable:
`instantiation_error`
`FromScale` is neither a variable nor an atom:
`type_error(atom,FromScale)`
`ToScale` is neither a variable nor an atom:
`type_error(atom,ToScale)`
`FromScale` is not supported:
`domain_error(time_scale,FromScale)`
`ToScale` is not supported:
`domain_error(time_scale,ToScale)`
`Instant` is not a valid instant term:
`domain_error(instant,Instant)`
`Scale` in `Instant` is neither a variable nor an atom:
`type_error(atom,Scale)`
`Scale` in `Instant` is not supported:
`domain_error(time_scale,Scale)`
`Seconds` in `Instant` is neither a variable nor an integer:
`type_error(integer,Seconds)`
`Seconds` in `Instant` is before supported UTC epoch:
`domain_error(utc_unix_seconds,Seconds)`
Fraction term in `Instant` is not of the form `fraction(Numerator,Denominator)`:
`domain_error(fraction,Fraction)`
`Numerator` in `Instant` is neither a variable nor an integer:
`type_error(integer,Numerator)`
`Denominator` in `Instant` is neither a variable nor an integer:
`type_error(integer,Denominator)`
`Denominator` in `Instant` is not positive:
`domain_error(positive_denominator,Denominator)`
Normalized fraction in `Instant` is not in the `[0,1[` interval:
`domain_error(normalized_fraction,Fraction)`
`Instant` scale does not match `FromScale`:
`domain_error(scale_mismatch,instant_scale(InstantScale,FromScale))`

`instant_to_utc_date_time/2`

Converts an UTC instant represented as `instant(utc,Seconds,fraction(Numerator,Denominator))` to a UTC datetime term. Requires zero fractional part.

Compilation flags:

`static`

Template:

`instant_to_utc_date_time(Instant,UTCDateTime)`

Mode and number of proofs:

`instant_to_utc_date_time(+compound,-compound) - zero_or_one`

---

convert/4

Converts an `instant(Scale,Seconds,fraction(Numerator,Denominator))` from `FromScale` to `ToScale`.

Compilation flags:
`static`

Template:
`convert(Instant,FromScale,ToScale,ConvertedInstant)`
Mode and number of proofs:
`convert(+compound,+atom,+atom,-compound) - zero_or_one`

---

check_convert/4

Converts an instant from `FromScale` to `ToScale` and throws an error instead of failing on invalid input.

Compilation flags:
`static`

Template:
`check_convert(Instant,FromScale,ToScale,ConvertedInstant)`
Mode and number of proofs:
`check_convert(+compound,+atom,+atom,-compound) - one_or_error`

Exceptions:
`Instant`, `FromScale`, or `ToScale` is a variable:
`instantiation_error`
`FromScale` is neither a variable nor an atom:
`type_error(atom,FromScale)`
`ToScale` is neither a variable nor an atom:
`type_error(atom,ToScale)`
`FromScale` is not supported:
`domain_error(time_scale,FromScale)`
`ToScale` is not supported:
`domain_error(time_scale,ToScale)`
`Instant` is not a valid instant term:
`domain_error(instant,Instant)`
`Scale` in `Instant` is neither a variable nor an atom:
`type_error(atom,Scale)`
`Scale` in `Instant` is not supported:
`domain_error(time_scale,Scale)`
`Seconds` in `Instant` is neither a variable nor an integer:
`type_error(integer,Seconds)`

`Seconds` in `Instant` is before supported UTC epoch:
`domain_error(utc_unix_seconds,Seconds)`
Fraction term in `Instant` is not of the form `fraction(Numerator,Denominator)`:
`domain_error(fraction,Fraction)`
`Numerator` in `Instant` is neither a variable nor an integer:
`type_error(integer,Numerator)`
`Denominator` in `Instant` is neither a variable nor an integer:
`type_error(integer,Denominator)`
`Denominator` in `Instant` is not positive:
`domain_error(positive_denominator,Denominator)`
Normalized fraction in `Instant` is not in the `[0,1[` interval:
`domain_error(normalized_fraction,Fraction)`
`Instant` scale does not match `FromScale`:
`domain_error(scale_mismatch,instant_scale(InstantScale,FromScale))`

`offset/3`

Returns the offset required to convert an instant to a target scale as `rational(Numerator,Denominator)`.

Compilation flags:
`static`

Template:
`offset(Instant,ToScale,Offset)`
Mode and number of proofs:
`offset(+compound,+atom,-compound)` - `zero_or_one`

`check_offset/3`

Returns the conversion offset and throws an error instead of failing on invalid input.

Compilation flags:
`static`

Template:
`check_offset(Instant,ToScale,Offset)`
Mode and number of proofs:
`check_offset(+compound,+atom,-compound)` - `one_or_error`

Exceptions:
`Instant` or `ToScale` is a variable:
`instantiation_error`
`ToScale` is neither a variable nor an atom:
`type_error(atom,ToScale)`
`ToScale` is not supported:

`domain_error(time_scale,ToScale)`

`Instant` is not a valid instant term:

`domain_error(instant,Instant)`

`Scale` in `Instant` is neither a variable nor an atom:

`type_error(atom,Scale)`

`Scale` in `Instant` is not supported:

`domain_error(time_scale,Scale)`

`Seconds` in `Instant` is neither a variable nor an integer:

`type_error(integer,Seconds)`

`Seconds` in `Instant` is before supported UTC epoch:

`domain_error(utc_unix_seconds,Seconds)`

Fraction term in `Instant` is not of the form `fraction(Numerator,Denominator)`:

`domain_error(fraction,Fraction)`

`Numerator` in `Instant` is neither a variable nor an integer:

`type_error(integer,Numerator)`

`Denominator` in `Instant` is neither a variable nor an integer:

`type_error(integer,Denominator)`

`Denominator` in `Instant` is not positive:

`domain_error(positive_denominator,Denominator)`

Normalized fraction in `Instant` is not in the `[0,1[` interval:

`domain_error(normalized_fraction,Fraction)`

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

forecaster_diagnostics_data/2

Hook predicate that importing forecaster implementations must define in order to expose diagnostics metadata. A default implementation is provided that assumes the diagnostics list is the last argument of the forecaster term; concrete implementations following that convention do not need to override it.

Compilation flags:

```
static
```

Template:

```
forecaster_diagnostics_data(Forecaster,Diagnostics)
```

Mode and number of proofs:

```
forecaster_diagnostics_data(+compound,-list(compound)) - one
```

---

forecaster_export_template/4

Hook predicate that importing forecaster implementations must define in order to expose the exported forecaster template for a given functor.

Compilation flags:

```
static
```

Template:

```
forecaster_export_template(Dataset,Forecaster,Functor,Template)
```

Mode and number of proofs:

```
forecaster_export_template(+object_identifier,+compound,+atom,-callable) - one
```

---

forecaster_term_template/2

Hook predicate that importing forecaster implementations must define in order to expose the learned forecaster term template used by pretty-printing helpers.

Compilation flags:

```
static
```

Template:

```
forecaster_term_template(Forecaster,Template)
```

Mode and number of proofs:

```
forecaster_term_template(+compound,-callable) - one
```

---

print_forecaster_template/1

Pretty-printing helper predicate used by importing forecaster implementations to show the learned forecaster term template.

Compilation flags:

```
static
```

Template:

```
print_forecaster_template(Forecaster)
```

Mode and number of proofs:

```
print_forecaster_template(+compound) - one
```

---

dataset_series/2

Collects the dataset time-ordered observation values. Checks that the observation indices form a complete, gap-free, 1-based sequence and that the declared series length matches the observed length.

Compilation flags:

```
static
```

Template:

```
dataset_series(Dataset,Series)
```

Mode and number of proofs:

```
dataset_series(+object_identifier,-list) - one_or_error
```

Exceptions:

The dataset contains no observations:

```
domain_error(non_empty_series,Dataset)
```

The observation indices do not form a complete, gap-free, 1-based sequence:

```
domain_error(series_index_sequence,Dataset)
```

An observation index or the declared series length is a variable:

```
instantiation_error
```

The declared series length is neither a variable nor an integer:

```
type_error(integer,DeclaredLength)
```

The declared series length is an integer but is not positive:

```
domain_error(positive_integer,DeclaredLength)
```

The declared and observed series lengths differ:

```
consistency_error(series_length,DeclaredLength,ObservedLength)
```

Index arithmetic raises an evaluation error:

```
evaluation_error(Error)
```

---

check_series/2

Checks that a time series is non-empty and that every observation value is a number.

Compilation flags:

```
static
```

Template:

```
check_series(Dataset,Series)
```

Mode and number of proofs:

```
check_series(+object_identifier,+list) - one_or_error
```

Exceptions:

`Series` is a partial list or a list with an element which is a variable:

```
instantiation_error
```

An element `Value` of the `Series` list is neither a variable nor a number:

```
type_error(number,Value)
```

`Series` is empty:

```
domain_error(non_empty_series,Dataset)
```

---

check_series/3

Checks that a time series is non-empty and that every observation value is of one of the given types.

Compilation flags:

```
static
```

Template:

```
check_series(Dataset,Series,Types)
```

Mode and number of proofs:

```
check_series(+object_identifier,+list,+list) - one_or_error
```

Exceptions:

`Series` is a partial list:

```
instantiation_error
```

An element `Value` of the `Series` list is neither a variable nor a number:

`domain_error(types(Types),Value)`
`Series` is empty:
`domain_error(non_empty_series,Dataset)`

---

check_series_length/3

Checks that a time series has at least the given minimum number of observations.

Compilation flags:
`static`

Template:
`check_series_length(Dataset,Series,MinimumLength)`
Mode and number of proofs:
`check_series_length(+object_identifier,+list,+non_negative_integer)` - `one_or_error`

Exceptions:
`MinimumLength` is a variable:
`instantiation_error`
`MinimumLength` is neither a variable nor an integer:
`type_error(integer,MinimumLength)`
`MinimumLength` is an integer but is negative:
`domain_error(non_negative_integer,MinimumLength)`
`Series` is shorter than `MinimumLength`:
`domain_error(series_length,Dataset)`

---

check_observation/1

Checks that an observation is a number or an unbound variable representing a missing observation.

Compilation flags:
`static`

Template:
`check_observation(Observation)`
Mode and number of proofs:
`check_observation(@term)` - `one_or_error`

Exceptions:
`Observation` is neither a variable nor a number:
`type_error(number,Observation)`

---

series_observation_summary/4

Returns the elapsed length, numeric observation count, and numeric sum of a series. Unbound observations are counted in the length only and are not instantiated. An empty list has zero length, count, and sum.

Compilation flags:

`static`

Template:

`series_observation_summary(Series,Length,ObservedCount,Sum)`

Mode and number of proofs:

`series_observation_summary(+list,-non_negative_integer,-non_negative_integer,-number)` - `one_or_error`

Exceptions:

`Series` is a variable or a partial list:

`instantiation_error`

`Series` is neither a variable nor a list:

`type_error(list,Series)`

An observation is neither a variable nor a number:

`type_error(number,Observation)`

Numeric summation raises an arithmetic evaluation error:

`evaluation_error(Error)`

---

normalize_missing_series/3

Copies numeric-or-unbound observations, sharing a fresh variable among missing positions without binding input variables.

Compilation flags:

`static`

Template:

`normalize_missing_series(Series,Normalized,Missing)`

Mode and number of proofs:

`normalize_missing_series(+list,-list,-term)` - `one_or_error`

Exceptions:

The series is unbound or partial:

`instantiation_error`

The series is not a list:

`type_error(list,Series)`

A known observation is not numeric:

`type_error(number,Value)`

---

indexed_series_observations/3

Collects known numeric values with their original one-based time indices.

Compilation flags:

```
static
```

Template:

```
indexed_series_observations(Series,Indices,Values)
```

Mode and number of proofs:

```
indexed_series_observations(+list,-list(positive_integer),-list(number)) -
one_or_error
```

Exceptions:

The list is unbound or partial:

```
instantiation_error
```

The series is not a list:

```
type_error(list,Series)
```

A known value is not numeric:

```
type_error(number,Value)
```

Index arithmetic fails:

```
evaluation_error(Error)
```

---

residual_fitted_values/3

Reconstructs aligned pre-update fits from numeric-or-unbound observations and residuals after the first known initialization anchor. Missing positions and the anchor have fresh independent unbound output placeholders.

Compilation flags:

```
static
```

Template:

```
residual_fitted_values(Series,Residuals,Values)
```

Mode and number of proofs:

```
residual_fitted_values(+list,+list(number),-list) - one_or_error
```

Exceptions:

A list is unbound or partial, or a residual is unbound:

```
instantiation_error
```

Series or residuals are not lists:

```
type_error(list,List)
```

A known observation or residual is not numeric:

```
type_error(number,Value)
```

The residual count differs from the known count minus the initialization anchor:

```
domain_error(residual_count,Residuals)
```

Fit reconstruction arithmetic fails:

```
evaluation_error(Error)
```

---

valid_residual_history/5

Validates ground parallel numeric residuals and strictly increasing original indices after the initialization anchor. Both lists must match the scored count. The caller validates finiteness; this predicate does not reconstruct error totals or certify historical observations.

Compilation flags:

```
static
```

Template:

```
valid_residual_history(Residuals,Indices,Anchor,Length,ScoredCount)
```

Mode and number of proofs:

```
valid_residual_history(@list,@list,@positive_integer,@positive_integer,
@non_negative_integer) - zero_or_one_or_error
```

Exceptions:

Index or count arithmetic fails:

```
evaluation_error(Error)
```

---

base_forecaster_diagnostics/5

Builds the common part of a forecaster diagnostics metadata list, combined with implementation-specific extra diagnostics terms.

Compilation flags:

```
static
```

Template:

```
base_forecaster_diagnostics(Model,TrainingSeriesLength,Options,ExtraDiagnostics,
Diagnostics)
```

Mode and number of proofs:

```
base_forecaster_diagnostics(+atom,+integer,+list(compound),+list(compound),
-list(compound)) - one
```

---

valid_forecaster_metadata/2

True when diagnostics metadata contains the expected model term.

Compilation flags:

```
static
```

Template:

```
valid_forecaster_metadata(Model,Diagnostics)
```

Mode and number of proofs:

```
valid_forecaster_metadata(+atom,+list(compound)) - zero_or_one
```

---

valid_forecaster_metadata/3

True when diagnostics metadata contains the expected model term and records the given effective options.

Compilation flags:
`static`

Template:
`valid_forecaster_metadata(Model,Options,Diagnostics)`
Mode and number of proofs:
`valid_forecaster_metadata(+atom,+list(compound),+list(compound))` - `zero_or_one`

---

replace_diagnostic/4

Replaces the value of the first unary diagnostic with the given name, preserving order. Fails when no such diagnostic exists.

Compilation flags:
`static`

Template:
`replace_diagnostic(Name,Value,Diagnostics,UpdatedDiagnostics)`
Mode and number of proofs:
`replace_diagnostic(+atom,+term,+list(compound),-list(compound))` - `zero_or_one`

---

updated_observation_diagnostics/3

Updates the training length, update count, observed count, and missing count of validated diagnostics after a numeric or missing observation, preserving metadata order and all other diagnostics. Requires existing non-negative integer counters.

Compilation flags:
`static`

Template:
`updated_observation_diagnostics(Diagnostics,Observation,UpdatedDiagnostics)`
Mode and number of proofs:
`updated_observation_diagnostics(+list(compound),@term,-list(compound))` - `one_or_error`

Exceptions:
`Observation` is neither a variable nor a number:
`type_error(number,Observation)`
Counter arithmetic raises an evaluation error:
`evaluation_error(Error)`

---

difference_series/2

Computes the first-order differences of a series: `Differences[i] = Series[i+1] - Series[i]`. The result has one fewer element than `Series`.

Compilation flags:
`static`

Template:
`difference_series(Series,Differences)`
Mode and number of proofs:
`difference_series(+list(number),-list(number))` - `one_or_error`

Exceptions:
`Series` is empty:
`domain_error(non_empty_series,Series)`

---

integrate_series/3

Reconstructs a series of levels from a series of differences and a starting base value (typically the last observed original value), by cumulative summing. Used to undo `difference_series/2` on forecasted differences.

Compilation flags:
`static`

Template:
`integrate_series(Differences,Base,Series)`
Mode and number of proofs:
`integrate_series(+list(number),+number,-list(number))` - `one`

---

lagged_rows/3

Builds a list of `Lags-Target` rows from a series, where `Lags` is a list of the `Order` most recent values preceding `Target`, most recent first (`[X(t-1), X(t-2), ..., X(t-Order)]-X(t)`). Requires the series to have more than `Order` observations.

Compilation flags:
`static`

Template:
`lagged_rows(Series,Order,Rows)`
Mode and number of proofs:
`lagged_rows(+list(number),+positive_integer,-list(pair))` - `one_or_error`

Exceptions:
`Order` is a variable:

`instantiation_error`
`Order` is neither a variable nor an integer:
`type_error(integer,Order)`
`Order` is an integer but is not positive:
`domain_error(positive_integer,Order)`
`Series` has `Order` or fewer observations:
`domain_error(series_length,Series)`

---

accumulate_forecast_error/4

Adds one numeric actual/prediction error to validated forecast_error_totals(Count, AbsoluteSum, SquaredSum), without retaining observations. Requires a non-negative integer count and non-negative numeric sums; forecast_error_totals(0,0,0) initializes accumulation. Missing observations must be skipped by the caller.

Compilation flags:
`static`

Template:
`accumulate_forecast_error(Actual,Prediction,Totals,UpdatedTotals)`
Mode and number of proofs:
`accumulate_forecast_error(+number,+number,+compound,-compound)` - `one_or_error`

Exceptions:
`Actual` or `Prediction` is a variable:
`instantiation_error`
`Actual` or `Prediction` is not a number:
`type_error(number,Value)`
Error or total arithmetic raises an evaluation error:
`evaluation_error(Error)`

---

forecast_error_metrics/3

Computes MAE and RMSE from validated forecast_error_totals(Count, AbsoluteSum, SquaredSum). Requires non-negative numeric sums and a positive integer count. Does not retain or reconstruct actual/predicted observations.

Compilation flags:
`static`

Template:
`forecast_error_metrics(Totals,MAE,RMSE)`
Mode and number of proofs:
`forecast_error_metrics(+compound,-float,-float)` - `one_or_error`

Exceptions:
The scored count is a variable:

```
instantiation_error
```

The scored count is not an integer:

```
type_error(integer,Count)
```

The scored count is not positive:

```
domain_error(positive_integer,Count)
```

Metric arithmetic raises an evaluation error:

```
evaluation_error(Error)
```

---

mean_absolute_error/3

Computes the mean absolute error (MAE) between actual and predicted value lists of matching length.

Compilation flags:

```
static
```

Template:

```
mean_absolute_error(Actual,Predicted,MAE)
```

Mode and number of proofs:

```
mean_absolute_error(+list(number),+list(number),-float) - one_or_error
```

Exceptions:

An input series is empty:

```
domain_error(non_empty_series,Series)
```

The actual and predicted series have different lengths:

```
consistency_error(same_length,Actual,Predicted)
```

---

root_mean_squared_error/3

Computes the root mean squared error (RMSE) between actual and predicted value lists of matching length.

Compilation flags:

```
static
```

Template:

```
root_mean_squared_error(Actual,Predicted,RMSE)
```

Mode and number of proofs:

```
root_mean_squared_error(+list(number),+list(number),-float) - one_or_error
```

Exceptions:

An input series is empty:

```
domain_error(non_empty_series,Series)
```

The actual and predicted series have different lengths:

```
consistency_error(same_length,Actual,Predicted)
```

---

mean_absolute_percentage_error/3

Computes the mean absolute percentage error (MAPE), as a percentage, between actual and predicted value lists of matching length.

Compilation flags:

`static`

Template:

`mean_absolute_percentage_error(Actual,Predicted,MAPE)`

Mode and number of proofs:

`mean_absolute_percentage_error(+list(number),+list(number),-float)` - `one_or_error`

Exceptions:

An input series is empty:

`domain_error(non_empty_series,Series)`

The actual and predicted series have different lengths:

`consistency_error(same_length,Actual,Predicted)`

An actual value is zero:

`evaluation_error(zero_divisor)`

---

naive_forecast/3

Repeats the last observed series value `Horizon` times (the naive/persistence baseline forecast). A zero horizon returns an empty list.

Compilation flags:

`static`

Template:

`naive_forecast(Series,Horizon,Forecasts)`

Mode and number of proofs:

`naive_forecast(+list(number),+non_negative_integer,-list(number))` - `one_or_error`

Exceptions:

`Horizon` is a variable:

`instantiation_error`

`Horizon` is neither a variable nor an integer:

`type_error(integer,Horizon)`

`Horizon` is an integer but is negative:

`domain_error(non_negative_integer,Horizon)`

---

constant_forecast/3

Repeats a value for the given forecast horizon. A zero horizon returns an empty list.

Compilation flags:
`static`

Template:
`constant_forecast(Value,Horizon,Forecasts)`
Mode and number of proofs:
`constant_forecast(+number,+non_negative_integer,-list(number))` - `one_or_error`

Exceptions:
`Horizon` is a variable:
`instantiation_error`
`Horizon` is neither a variable nor an integer:
`type_error(integer,Horizon)`
`Horizon` is an integer but is negative:
`domain_error(non_negative_integer,Horizon)`

---

linear_trend_forecast/4

Forecasts `Last + Step * Slope` for steps one through the horizon. A zero horizon returns an empty list.

Compilation flags:
`static`

Template:
`linear_trend_forecast(Last,Slope,Horizon,Forecasts)`
Mode and number of proofs:
`linear_trend_forecast(+number,+number,+non_negative_integer,-list(number))` - `one_or_error`

Exceptions:
`Horizon`, `Last`, or `Slope` is a variable:
`instantiation_error`
`Horizon` is neither a variable nor an integer:
`type_error(integer,Horizon)`
`Horizon` is an integer but is negative:
`domain_error(non_negative_integer,Horizon)`
`Last` is neither a variable nor a number:
`type_error(number,Last)`
`Slope` is neither a variable nor a number:
`type_error(number,Slope)`
Trend extrapolation raises an arithmetic evaluation error:
`evaluation_error(Error)`

---

check_forecast_horizon/1

Checks that a forecast horizon is a non-negative integer.

Compilation flags:
`static`

Template:
`check_forecast_horizon(Horizon)`
Mode and number of proofs:
`check_forecast_horizon(+non_negative_integer)` - `one_or_error`

Exceptions:
`Horizon` is a variable:
`instantiation_error`
`Horizon` is neither a variable nor an integer:
`type_error(integer,Horizon)`
`Horizon` is an integer but is negative:
`domain_error(non_negative_integer,Horizon)`

---

seasonal_naive_forecast/4

Repeats the last full seasonal cycle of `Frequency` observations, cycling as needed to cover `Horizon` forecasts (the seasonal naive baseline forecast).

Compilation flags:
`static`

Template:
`seasonal_naive_forecast(Series,Frequency,Horizon,Forecasts)`
Mode and number of proofs:
`seasonal_naive_forecast(+list(number),+positive_integer,+non_negative_integer,-list(number))` - `one_or_error`

Exceptions:
`Frequency` is a variable:
`instantiation_error`
`Frequency` is neither a variable nor an integer:
`type_error(integer,Frequency)`
`Frequency` is an integer but is not positive:
`domain_error(positive_integer,Frequency)`
`Horizon` is a variable:
`instantiation_error`
`Horizon` is neither a variable nor an integer:
`type_error(integer,Horizon)`
`Horizon` is an integer but is negative:
`domain_error(non_negative_integer,Horizon)`

`Series` has fewer than `Frequency` observations:
`domain_error(series_length,Series)`

`check_frequency/1`

Checks that a seasonal frequency is a positive integer.

Compilation flags:
`static`

Template:
`check_frequency(Frequency)`
Mode and number of proofs:
`check_frequency(+positive_integer)` - `one_or_error`

Exceptions:
`Frequency` is a variable:
`instantiation_error`
`Frequency` is neither a variable nor an integer:
`type_error(integer,Frequency)`
`Frequency` is an integer but is not positive:
`domain_error(positive_integer,Frequency)`

`seasonal_autocorrelation_test/4`

Tests original-lag available-pair autocorrelations using the known observation count and requiring two known pairs at every tested lag.

Compilation flags:
`static`

Template:
`seasonal_autocorrelation_test(Series,Frequency,Statistic,Seasonal)`
Mode and number of proofs:
`seasonal_autocorrelation_test(+list,+positive_integer,-number,-boolean)` - `one_or_error`

Exceptions:
The series or frequency is unbound:
`instantiation_error`
A series value is not numeric:
`type_error(number,Value)`
The series is not a list:
`type_error(list,Series)`
The series is empty:

```
domain_error(non_empty_series,Series)
```

The frequency is not an integer:

```
type_error(integer,Frequency)
```

The frequency is not positive:

```
domain_error(positive_integer,Frequency)
```

Seasonality test arithmetic fails:

```
evaluation_error(Error)
```

---

classical_seasonal_adjustment/5

Deseasonalizes known values using complete centered windows and normalized phase factors, preserving missing observations as unbound variables.

Compilation flags:

```
static
```

Template:

```
classical_seasonal_adjustment(Series,Frequency,Method,AdjustedSeries,Factors)
```

Mode and number of proofs:

```
classical_seasonal_adjustment(+list,+positive_integer,+atom,-list,-list(number))
- one_or_error
```

Exceptions:

The series, frequency, or method is unbound:

```
instantiation_error
```

A value is not numeric:

```
type_error(number,Value)
```

The series is not a list:

```
type_error(list,Series)
```

The series is empty:

```
domain_error(non_empty_series,Series)
```

The frequency is not an integer:

```
type_error(integer,Frequency)
```

The frequency is not positive:

```
domain_error(positive_integer,Frequency)
```

The frequency is less than two:

```
domain_error(seasonal_frequency,Frequency)
```

The series has fewer than two cycles:

```
domain_error(series_length,Series)
```

The method is invalid:

```
domain_error(seasonal_adjustment_method,Method)
```

A phase has no valid centered-window deviation:

```
domain_error(insufficient_seasonal_phase_observations,Phase)
```

Multiplicative data or factors are not positive:

```
domain_error(positive_number,Value)
```

Seasonal adjustment arithmetic fails:

```
evaluation_error(Error)
```

restore_seasonality/5

Adds or multiplies a seasonal cycle, advancing phase through missing positions without instantiating them.

Compilation flags:

```
static
```

Template:

```
restore_seasonality(Method,Factors,StartPhase,Values,RestoredValues)
```

Mode and number of proofs:

```
restore_seasonality(+atom,+list(number),+positive_integer,+list,-list) -
one_or_error
```

Exceptions:

The method, phase, factor, or values list is unbound:

```
instantiation_error
```

A factor or value is not numeric:

```
type_error(number,Value)
```

Factors or values are not lists:

```
type_error(list,List)
```

The factors are empty:

```
domain_error(non_empty_series,Factors)
```

The method is invalid:

```
domain_error(seasonal_adjustment_method,Method)
```

The phase is not an integer:

```
type_error(integer,StartPhase)
```

The phase is not positive:

```
domain_error(positive_integer,StartPhase)
```

The phase exceeds the cycle length:

```
domain_error(seasonal_phase,StartPhase)
```

A multiplicative factor is not positive:

```
domain_error(positive_number,Value)
```

Restoration arithmetic fails:

```
evaluation_error(Error)
```

Private predicates

sorted_observations/5

Validates sorted indices without binding them while collecting values and counting observations.

Compilation flags:

```
static
```

Template:

```
sorted_observations(Pairs,Dataset,ExpectedIndex,Length,Series)
```

Mode and number of proofs:

```
sorted_observations(@list(pair),+object_identifier,+positive_integer,
-non_negative_integer,-list) - one_or_error
```

Exceptions:

An observation index is a variable:

```
instantiation_error
```

The observation indices are not a gap-free 1-based integer sequence:

```
domain_error(series_index_sequence,Dataset)
```

Index arithmetic raises an evaluation error:

```
evaluation_error(Error)
```

---

normalize_missing_values/4

Copies known numbers and replaces unbound inputs with a fresh shared variable.

Compilation flags:

```
static
```

Template:

```
normalize_missing_values(Series,Missing,Context,Normalized)
```

Mode and number of proofs:

```
normalize_missing_values(+list,-term,+term,-list) - one_or_error
```

Exceptions:

A known observation is not numeric:

```
type_error(number,Value)
```

---

indexed_known_values/5

Extracts known observations while retaining elapsed positions.

Compilation flags:

```
static
```

Template:

```
indexed_known_values(Series,Index,Context,Indices,Values)
```

Mode and number of proofs:

```
indexed_known_values(+list,+positive_integer,+term,-list,-list) - one_or_error
```

Exceptions:

A known value is not numeric:

```
type_error(number,Value)
```

Index arithmetic fails:

```
evaluation_error(Error)
```

---

check_numeric_residuals/2

Checks residual numbers without completing lists or binding entries.

Compilation flags:

```
static
```

Template:

```
check_numeric_residuals(Residuals,Context)
```

Mode and number of proofs:

```
check_numeric_residuals(+list,+term) - one_or_error
```

Exceptions:

A residual is unbound:

```
instantiation_error
```

A residual is not numeric:

```
type_error(number,Value)
```

---

aligned_residual_fits/5

Consumes residuals only at known positions after the initialization anchor, failing on a count mismatch.

Compilation flags:

```
static
```

Template:

```
aligned_residual_fits(Series,Residuals,AnchorSeen,Context,Values)
```

Mode and number of proofs:

```
aligned_residual_fits(+list,+list(number),+boolean,+term,-list) -
zero_or_one_or_error
```

Exceptions:

A known observation is not numeric:

```
type_error(number,Value)
```

Fit reconstruction arithmetic fails:

```
evaluation_error(Error)
```

---

valid_residual_positions/3

Checks original residual positions in strict chronological order within the elapsed length.

Compilation flags:

`static`

Template:

`valid_residual_positions(Indices,Previous,Length)`

Mode and number of proofs:

`valid_residual_positions(+list(integer),+integer,+positive_integer)` - `zero_or_one_or_error`

Exceptions:

Index comparison fails:

`evaluation_error(Error)`

---

seasonal_centered_values/5

Centers validated observations and accumulates squared deviations.

Compilation flags:

`static`

Template:

`seasonal_centered_values(Series,Mean,Centered,Variance0,Variance)`

Mode and number of proofs:

`seasonal_centered_values(+list(number),+number,-list(number),+number,-number)` - `one_or_error`

Exceptions:

Centering arithmetic fails:

`evaluation_error(Error)`

---

seasonal_lag_scores/7

Accumulates earlier squared autocorrelations and the seasonal-lag score.

Compilation flags:

`static`

Template:

`seasonal_lag_scores(Lag,Frequency,Centered,Variance,Squares0,Squares,Last)`

Mode and number of proofs:

`seasonal_lag_scores(+positive_integer,+positive_integer,+list(number),+number,+number,-number,-number)` - `one_or_error`

Exceptions:

Autocorrelation arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_covariance/4

Accumulates products of aligned centered observations.

Compilation flags:

```
static
```

Template:

```
seasonal_covariance(Suffix,Series,Covariance0,Covariance)
```

Mode and number of proofs:

```
seasonal_covariance(+list(number),+list(number),+number,-number) - one_or_error
```

Exceptions:

Covariance arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_check_method/1

Checks the seasonal adjustment method without binding it.

Compilation flags:

```
static
```

Template:

```
seasonal_check_method(Method)
```

Mode and number of proofs:

```
seasonal_check_method(@term) - one_or_error
```

Exceptions:

The method is unbound:

```
instantiation_error
```

The method is invalid:

```
domain_error(seasonal_adjustment_method,Method)
```

---

seasonal_positive_values/1

Requires strictly positive validated numeric values.

Compilation flags:
`static`

Template:
`seasonal_positive_values(Values)`
Mode and number of proofs:
`seasonal_positive_values(+list(number))` - `one_or_error`

Exceptions:
A value is not positive:
`domain_error(positive_number,Value)`
Numeric comparison fails:
`evaluation_error(Error)`

---

seasonal_window_means/5

Computes successive moving averages with a rolling sum.

Compilation flags:
`static`

Template:
`seasonal_window_means(Entering,Leaving,Frequency,Sum,Means)`
Mode and number of proofs:
`seasonal_window_means(+list(number),+list(number),+positive_integer,+number,-list(number))` - `one_or_error`

Exceptions:
Moving-average arithmetic fails:
`evaluation_error(Error)`

---

seasonal_center_even/2

Centers even-period moving averages using adjacent means.

Compilation flags:
`static`

Template:
`seasonal_center_even(Means,Centered)`
Mode and number of proofs:

```
seasonal_center_even(+list(number),-list(number)) - one_or_error
```

Exceptions:

Centering arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_deviations/4

Computes interior differences or ratios against centered trend estimates.

Compilation flags:

```
static
```

Template:

```
seasonal_deviations(Trends,Values,Method,Deviations)
```

Mode and number of proofs:

```
seasonal_deviations(+list(number),+list(number),+atom,-list(number)) -
one_or_error
```

Exceptions:

A multiplicative trend is not positive:

```
domain_error(positive_number,Value)
```

Detrending arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_fold_cycles/3

Accumulates complete and partial cycles into phase buckets.

Compilation flags:

```
static
```

Template:

```
seasonal_fold_cycles(Values,Buckets0,Buckets)
```

Mode and number of proofs:

```
seasonal_fold_cycles(+list,+list(compound),-list(compound)) - one_or_error
```

Exceptions:

Phase accumulation fails:

```
evaluation_error(Error)
```

---

seasonal_bucket_means/2

Computes phase means from nonempty phase totals.

Compilation flags:
`static`

Template:
`seasonal_bucket_means(Buckets,Means)`
Mode and number of proofs:
`seasonal_bucket_means(+list(compound),-list(number))` - `one_or_error`

Exceptions:
Phase-mean arithmetic fails:
`evaluation_error(Error)`

---

seasonal_normalize/4

Normalizes phase factors to zero or unit mean.

Compilation flags:
`static`

Template:
`seasonal_normalize(Values,Method,Mean,Factors)`
Mode and number of proofs:
`seasonal_normalize(+list(number),+atom,+number,-list(number))` - `one_or_error`

Exceptions:
A multiplicative factor is not positive:
`domain_error(positive_number,Value)`
Normalization arithmetic fails:
`evaluation_error(Error)`

---

seasonal_inverse_factors/3

Negates additive factors or reciprocates positive multiplicative factors.

Compilation flags:
`static`

Template:
`seasonal_inverse_factors(Factors,Method,Inverses)`
Mode and number of proofs:
`seasonal_inverse_factors(+list(number),+atom,-list(number))` - `one_or_error`

Exceptions:

Factor inversion fails:

`evaluation_error(Error)`

---

seasonal_restore_values/5

Restores validated values while cycling through phase factors.

Compilation flags:

`static`

Template:

`seasonal_restore_values(Values,Method,Factors,Cycle,Restored)`

Mode and number of proofs:

`seasonal_restore_values(+list,+atom,+list(number),+list(number),-list)` - `one_or_error`

Exceptions:

Restoration arithmetic fails:

`evaluation_error(Error)`

---

seasonal_complete_autocorrelation_test/4

Computes the original complete-data seasonality statistic for validated inputs.

Compilation flags:

`static`

Template:

`seasonal_complete_autocorrelation_test(Series,Frequency,Statistic,Seasonal)`

Mode and number of proofs:

`seasonal_complete_autocorrelation_test(+list(number),+positive_integer,-number,-boolean)` - `one_or_error`

Exceptions:

Autocorrelation arithmetic fails:

`evaluation_error(Error)`

---

classical_complete_seasonal_adjustment/5

Computes classical seasonal factors for validated complete data.

Compilation flags:

```
static
```

Template:

```
classical_complete_seasonal_adjustment(Series,Frequency,Method,Adjusted,Factors)
```

Mode and number of proofs:

```
classical_complete_seasonal_adjustment(+list(number),+positive_integer,+atom,
-list(number),-list(number)) - one_or_error
```

Exceptions:

Multiplicative data, trends, or factors are not positive:

```
domain_error(positive_number,Value)
```

Seasonal arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_gap_centered/4

Centers known values without removing gaps.

Compilation flags:

```
static
```

Template:

```
seasonal_gap_centered(Series,Mean,Centered,Variance)
```

Mode and number of proofs:

```
seasonal_gap_centered(+list,+number,-list,-number) - one_or_error
```

Exceptions:

Centering arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_gap_lags/7

Accumulates original-lag scores, failing when fewer than two pairs are available.

Compilation flags:

```
static
```

Template:

```
seasonal_gap_lags(Lag,Frequency,Centered,Variance,Squares0,Squares,Last)
```

Mode and number of proofs:

```
seasonal_gap_lags(+positive_integer,+positive_integer,+list,+number,+number,
-number,-number) - zero_or_one_or_error
```

Exceptions:

Autocorrelation arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_gap_covariance/4

Sums centered products and counts pairs with both positions known.

Compilation flags:

```
static
```

Template:

```
seasonal_gap_covariance(Suffix,Series,Covariance,Pairs)
```

Mode and number of proofs:

```
seasonal_gap_covariance(+list,+list,-number,-non_negative_integer) - one_or_error
```

Exceptions:

Covariance arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_gap_windows/5

Computes moving averages with rolling sums and missing counts, marking incomplete windows.

Compilation flags:

```
static
```

Template:

```
seasonal_gap_windows(Entering,Leaving,Frequency,Window,Means)
```

Mode and number of proofs:

```
seasonal_gap_windows(+list,+list,+positive_integer,+compound,-list) - one_or_error
```

Exceptions:

Moving-average arithmetic fails:

```
evaluation_error(Error)
```

---

seasonal_gap_even/2

Centers adjacent complete windows, requiring the full even-period support.

Compilation flags:
```
static
```

Template:
```
seasonal_gap_even(Means,Trends)
```
Mode and number of proofs:
```
seasonal_gap_even(+list,-list) - one_or_error
```

Exceptions:
Centering arithmetic fails:
```
evaluation_error(Error)
```

---

seasonal_gap_deviations/4

Computes only known deviations with complete trend support, retaining phase positions.

Compilation flags:
```
static
```

Template:
```
seasonal_gap_deviations(Trends,Values,Method,Deviations)
```
Mode and number of proofs:
```
seasonal_gap_deviations(+list,+list,+atom,-list) - one_or_error
```

Exceptions:
A multiplicative trend is not positive:
```
domain_error(positive_number,Value)
```
Detrending arithmetic fails:
```
evaluation_error(Error)
```

---

seasonal_accumulate_cycle/4

Advances a phase bucket for every position, skipping missing contributions.

Compilation flags:
```
static
```

Template:
```
seasonal_accumulate_cycle(Values,Buckets,Updated,Rest)
```
Mode and number of proofs:

```
seasonal_accumulate_cycle(+list,+list(compound),-list(compound),-list) -
one_or_error
```

Exceptions:

Phase accumulation fails:

```
evaluation_error(Error)
```

---

seasonal_check_buckets/2

Reports the lowest absolute phase lacking an estimable seasonal deviation.

Compilation flags:

```
static
```

Template:

```
seasonal_check_buckets(Buckets,Phase)
```

Mode and number of proofs:

```
seasonal_check_buckets(+list(compound),+positive_integer) - one_or_error
```

Exceptions:

A phase has no valid deviation:

```
domain_error(insufficient_seasonal_phase_observations,Phase)
```

Phase arithmetic fails:

```
evaluation_error(Error)
```

Operators

(none)

protocol

1.323.2 forecaster_protocol

Protocol for time series forecasting models.

Availability:

- *Operators*

Public predicates

learn/3

Learns a forecasting model from the given time series dataset object using the specified options.

Compilation flags:
`static`

Template:
`learn(Dataset,Forecaster,Options)`
Mode and number of proofs:
`learn(+object_identifier,-compound,+list(compound))` - `one_or_error`

Exceptions:
`Dataset` is a variable:
`instantiation_error`
`Dataset` is neither a variable nor a valid object identifier:
`type_error(object_identifier,Dataset)`
`Dataset` is a valid object identifier but not an existing object:
`existence_error(object,Dataset)`
`Options` is a variable:
`instantiation_error`

`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:
`type_error(compound,Option)`
An element `Option` of the list `Options` is a compound term but not a valid option:
`domain_error(option,Option)`

---

learn/2

Learns a forecasting model from the given time series dataset object using default options.

Compilation flags:
`static`

Template:
`learn(Dataset,Forecaster)`
Mode and number of proofs:
`learn(+object_identifier,-compound)` - `one_or_error`

Exceptions:
`Dataset` is a variable:
`instantiation_error`
`Dataset` is neither a variable nor a valid object identifier:
`type_error(object_identifier,Dataset)`
`Dataset` is a valid object identifier but not an existing object:
`existence_error(object,Dataset)`

---

forecast/3

Forecasts the next `Horizon` values beyond the training series using the learned forecasting model. A zero horizon returns an empty list.

Compilation flags:
`static`

Template:
`forecast(Forecaster,Horizon,Forecasts)`
Mode and number of proofs:
`forecast(+compound,+non_negative_integer,-list(number))` - `one_or_error`

Exceptions:
`Forecaster` is a variable:
`instantiation_error`

`Forecaster` is not a valid forecaster:
`domain_error(forecaster,Forecaster)`
`Horizon` is a variable:
`instantiation_error`
`Horizon` is neither a variable nor an integer:
`type_error(integer,Horizon)`
`Horizon` is an integer but is negative:
`domain_error(non_negative_integer,Horizon)`

---

check_forecaster/1

Checks that a learned forecaster term is structurally valid for the receiving implementation. Throws an exception when the term is not a valid forecaster representation.

Compilation flags:
`static`

Template:
`check_forecaster(Forecaster)`
Mode and number of proofs:
`check_forecaster(@compound)` - `one_or_error`

Exceptions:
`Forecaster` is a variable:
`instantiation_error`
`Forecaster` is neither a variable nor a valid forecaster:
`domain_error(forecaster,Forecaster)`

---

valid_forecaster/1

True when a learned forecaster term is structurally valid for the receiving implementation. Succeeds iff `check_forecaster/1` succeeds without throwing an exception.

Compilation flags:
`static`

Template:
`valid_forecaster(Forecaster)`
Mode and number of proofs:
`valid_forecaster(@compound)` - `zero_or_one`

---

diagnostics/2

Returns diagnostics metadata for a learned forecaster.

Compilation flags:
```
static
```

Template:
```
diagnostics(Forecaster,Diagnostics)
```
Mode and number of proofs:
```
diagnostics(+compound,-list(compound)) - one
```

---

diagnostic/2

Enumerates individual diagnostics metadata terms for a learned forecaster.

Compilation flags:
```
static
```

Template:
```
diagnostic(Forecaster,Diagnostic)
```
Mode and number of proofs:
```
diagnostic(+compound,?compound) - zero_or_more
```

---

forecaster_options/2

Returns the effective training options recorded in a learned forecaster diagnostics metadata.

Compilation flags:
```
static
```

Template:
```
forecaster_options(Forecaster,Options)
```
Mode and number of proofs:
```
forecaster_options(+compound,-list(compound)) - one
```

---

export_to_clauses/4

Converts a forecaster into a list of predicate clauses. `Functor` is the functor for the generated predicate clauses. When exporting a serialized forecaster term, a noun such as `forecaster` or `model` is usually clearer than a verb such as `forecast`.

Compilation flags:

`static`

Template:

`export_to_clauses(Dataset,Forecaster,Functor,Clauses)`

Mode and number of proofs:

`export_to_clauses(+object_identifier,+compound,+atom,-list(clause))` - `one_or_error`

Exceptions:

`Forecaster` or `Functor` is a variable:

`instantiation_error`

`Forecaster` is not a valid baseline forecaster:

`domain_error(forecaster,Forecaster)`

`Functor` is neither a variable nor an atom:

`type_error(atom,Functor)`

---

export_to_file/4

Exports a forecaster to a file. `Functor` is the functor for the generated predicate clauses. When exporting a serialized forecaster term, a noun such as `forecaster` or `model` is usually clearer than a verb such as `forecast`.

Compilation flags:

`static`

Template:

`export_to_file(Dataset,Forecaster,Functor,File)`

Mode and number of proofs:

`export_to_file(+object_identifier,+compound,+atom,+atom)` - `one_or_error`

Exceptions:

`Forecaster`, `Functor`, or `File`:

`instantiation_error`

`Forecaster` is not a valid forecaster:

`domain_error(forecaster,Forecaster)`

`Functor` is neither a variable nor an atom:

`type_error(atom,Functor)`

`File` is not a valid file specification:

`type_error(source_sink,File)`

The output location does not exist:

`existence_error(source_sink,File)`

The output file cannot be opened:

`permission_error(open,source_sink,File)`

The output stream cannot be written to:
`permission_error(output,stream,Stream)`

`print_forecaster/1`

Prints a forecaster to the current output stream in a human-readable format.

Compilation flags:
`static`

Template:
`print_forecaster(Forecaster)`

Mode and number of proofs:
`print_forecaster(+compound)` - `one_or_error`

Exceptions:
`Forecaster` is a variable:
`instantiation_error`
`Forecaster` is not a valid baseline forecaster:
`domain_error(forecaster,Forecaster)`
The current stream cannot be written to:
`permission_error(output,stream,Stream)`

time_series_dataset_protocol

protocol

1.323.3 time_series_dataset_protocol

Protocol for datasets used with time series forecasting algorithms.

Availability:
`logtalk_load(time_series_protocols(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-09-27

Compilation flags:
`static`

Dependencies:
(none)

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *observation/2*
  - *series_length/1*
  - *frequency/1*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

observation/2

Enumerates by backtracking the time-ordered observations. `Index` is the 1-based position of the observation in the series and `Value` is its numeric value.

Compilation flags:
`static`

Template:
`observation(Index,Value)`
Mode and number of proofs:
`observation(-integer,-number)` - `zero_or_more`

series_length/1

Returns the number of observations in the series. The declared length must match the number of observations enumerated by `observation/2`.

Compilation flags:
`static`

Template:
`series_length(Length)`
Mode and number of proofs:
`series_length(-positive_integer)` - `one`

---

frequency/1

Returns the positive number of observations per seasonal cycle (e.g. 12 for monthly data with yearly seasonality). Fails when the series has no declared seasonal period.

Compilation flags:
`static`

Template:
`frequency(Frequency)`
Mode and number of proofs:
`frequency(-positive_integer)` - `zero_or_one`

Protected predicates

(none)

Private predicates

(none)

Operators

1.324 time_series_regression

object

1.324.1 time_series_regression

Autoregressive (AR) time series forecaster fitted by least squares, with optional intercept, optional differencing (ARI models), automatic order selection using information criteria, and support for missing observations represented as unbound variables.

Availability:

```
logtalk_load(time_series_regression(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-10-14

Compilation flags:

```
static, context_switching_calls
```

Imports:

```
public forecaster_common
```

Uses:

format
integer
linear_algebra
list
type
univariate_distributions(Random)

Remarks:

(none)

Inherited public predicates:

- *Public predicates*
  - *update/3*
  - *forecast_interval/5*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

update/3

Returns a new forecaster after appending one observation. Observation may be left an unbound variable to represent a missing observation; see update/4.

Compilation flags:

static

Template:

update(Forecaster,Observation,UpdatedForecaster)

Mode and number of proofs:

update(+compound,@number,-compound) - one_or_error

Exceptions:

Forecaster is a variable:

instantiation_error

Forecaster is neither a variable nor a valid forecaster:

domain_error(forecaster,Forecaster)

Observation is neither a variable nor a number:

type_error(number,Observation)

---

forecast_interval/5

Computes analytic prediction interval bounds for the next Horizon forecasts of a learned forecaster, assuming independent, identically distributed, zero-mean Gaussian innovations and treating the fitted coefficients as known. The h-step forecast error variance is the residual variance times the sum of the squared psi weights psi(0)..psi(h-1) of the (integrated) model, and the bounds are the point forecast plus or minus the standard normal quantile for the requested confidence times the forecast error standard deviation. The residual variance is the sum of squared errors divided by the residual degrees of freedom (the number of scored observations minus the design matrix rank). A zero horizon returns two empty lists.

Compilation flags:

static

Template:

forecast_interval(Forecaster,Horizon,Lower,Upper,Options)

Mode and number of proofs:

forecast_interval(+compound,+non_negative_integer,-list(number),-list(number),
+list(compound)) - one_or_error

Exceptions:

Forecaster is a variable:

instantiation_error

Forecaster is neither a variable nor a valid forecaster:

domain_error(forecaster,Forecaster)

Horizon is a variable:

instantiation_error

Horizon is neither a variable nor an integer:

`type_error(integer,Horizon)`
`Horizon` is an integer but is negative:
`domain_error(non_negative_integer,Horizon)`
`Options` is a variable or a partial list:
`instantiation_error`
`Options` is neither a variable nor a list:
`type_error(list,Options)`
An option is a variable or has an unbound argument:
`instantiation_error`
An option is neither a variable nor a compound term:
`type_error(compound,Option)`
An option is a compound term but is not a valid interval option:
`domain_error(option,Option)`
`Horizon` is positive and the forecaster has no residual degrees of freedom (an exactly determined fit):
`domain_error(residual_degrees_of_freedom,Forecaster)`

1.325 timeout

object

1.325.1 `timeout`

Predicates for calling goal with a time limit.

Availability:
`logtalk_load(timeout(loader))`

Author: Paulo Moura
Version: 0:11:0
Date: 2026-10-28

Compilation flags:

```
static, context_switching_calls
```

Dependencies:
(none)

Remarks:

- Supported backend Prolog systems: B-Prolog, ECLiPSe, SICStus Prolog, Shumway Prolog, SWI-Prolog, Trealla Prolog, XSB, XVM, and YAP.

Inherited public predicates:
(none)

- *Public predicates*
  - *call_with_timeout/2*
  - *call_with_timeout/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

call_with_timeout/2

Calls a goal deterministically with the given time limit (expressed in seconds). Note that the goal may fail or throw an error before exhausting the time limit.

Compilation flags:
```
static
```

Template:
```
call_with_timeout(Goal,Timeout)
```
Meta-predicate template:
```
call_with_timeout(0,*)
```
Mode and number of proofs:
```
call_with_timeout(+callable,+positive_number) - zero_or_one
```

Exceptions:
Goal does not complete in the allowed time:
```
timeout(Goal)
```

`call_with_timeout/3`

Calls a goal deterministically with the given time limit (expressed in seconds) returning a reified result: `true`, `fail`, `timeout`, or `error(Error)`.

Compilation flags:
`static`

Template:
`call_with_timeout(Goal,Timeout,Result)`
Meta-predicate template:
`call_with_timeout(0,*,*)`
Mode and number of proofs:
`call_with_timeout(+callable,+positive_number,--atom)` - `one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)

1.326 tle_orbits

object

1.326.1 `tle_orbits`

Parser for Two-Line Element sets with an approximate portable propagator featuring automatic branching between near-earth and deep-space variants, a legacy two-body fallback model, and ground-track sampling.

Availability:
`logtalk_load(tle_orbits(loader))`

Author: Paulo Moura
Version: 1:2:1
Date: 2026-08-02

- *Operators*

Public predicates

parse/2

Parses one or more TLE records from a source specification into canonical `tle(...)` terms. Supported source specifications are `atom(Atom)`, `chars(List)`, `codes(List)`, `stream(Stream)`, and `file(Path)`.

Compilation flags:
`static`

Template:
`parse(Source,TLEs)`

Mode and number of proofs:
`parse(++compound,--list(compound))` - `one_or_error`

Exceptions:
`Source` is a variable or contains a variable source argument:
`instantiation_error`
`Source` is neither a variable nor a valid source specification:
`domain_error(tle_source,Source)`
The parsed non-blank lines cannot be grouped into valid TLE records:
`domain_error(tle_records,Lines)`

parse_lines/4

Parses a single TLE record given an optional name atom or the atom `none` plus the two raw TLE lines.

Compilation flags:
`static`

Template:
`parse_lines(Name,Line1,Line2,TLE)`
Mode and number of proofs:
`parse_lines(++nonvar,++atom,++atom,--compound)` - `one_or_error`

Exceptions:
`Name` is a variable:
`instantiation_error`
`Name` is neither the atom `none` nor an atom name:
`domain_error(tle_name,Name)`
`Line1` is a variable:
`instantiation_error`
`Line1` is neither a variable nor an atom:
`domain_error(tle_line,Line1)`
`Line2` is a variable:
`instantiation_error`
`Line2` is neither a variable nor an atom:
`domain_error(tle_line,Line2)`
The given name and lines do not form a valid TLE record because of invalid syntax, checksum, field encoding, or orbital element ranges:
`domain_error(tle_lines,[Name,Line1,Line2])`

propagate/3

Propagates a parsed TLE using the default `approximate` model and returns a `geographic(Latitude,Longitude,Height)` coordinate. Supported time specifications are `date_time(Year,Month,Day,Hours,Minutes,Seconds)`, `julian_date(JulianDate)`, and `offset_seconds(SecondsSinceEpoch)`.

Compilation flags:
`static`

Template:
`propagate(TLE,Time,Coordinate)`
Mode and number of proofs:
`propagate(++compound,++nonvar,--compound)` - `one_or_error`

Exceptions:
`Time` is not one of the supported time specifications with the required numeric components:

domain_error(tle_time,Time)

---

propagate/4

Propagates a parsed TLE using the default approximate model and returns coordinates in the requested frame. Supported frames are eci returning eci(X,Y,Z), ecef returning ecef(X,Y,Z), and wgs84_3d returning geographic(Latitude, Longitude,Height).

Compilation flags:

static

Template:

propagate(TLE,Time,Frame,Coordinate)

Mode and number of proofs:

propagate(++compound,++nonvar,++atom,--compound) - one_or_error

Exceptions:

Frame is not one of the supported reference frame identifiers:

domain_error(tle_reference_frame,Frame)

Time is not one of the supported time specifications with the required numeric components:

domain_error(tle_time,Time)

---

propagate/5

Propagates a parsed TLE using the requested propagation model and returns coordinates in the requested frame. Supported models are approximate for automatic near-earth versus deep-space dispatch, approximate_near_earth for the low-period approximate branch with J2 secular and short-period corrections plus low-order B* drag handling, approximate_deep_space for the dedicated deep-space approximate branch with resonance-aware long-period corrections, and two_body for the legacy Keplerian approximation.

Compilation flags:

static

Template:

propagate(TLE,Time,Frame,Model,Coordinate)

Mode and number of proofs:

propagate(++compound,++nonvar,++atom,++atom,--compound) - one_or_error

Exceptions:

Frame is not one of the supported reference frame identifiers:

domain_error(tle_reference_frame,Frame)

Model is not one of the supported propagation model identifiers:

domain_error(tle_propagation_model,Model)

Time is not one of the supported time specifications with the required numeric components:

domain_error(tle_time,Time)

---

propagate_state/4

Propagates a parsed TLE using the default `approximate` model and returns `state(Position,Velocity)` in the requested frame. Velocity is derived directly from the propagated orbital elements in ECI and analytically transformed to the requested frame. Supported frames are `eci` returning `state(eci(X,Y,Z), eci(VX,VY,VZ))`, `ecef` returning `state(ecef(X,Y,Z), ecef(VX,VY,VZ))`, and `wgs84_3d` returning `state(geographic(Latitude,Longitude,Height), enu(East,North,Up))`.

Compilation flags:

`static`

Template:

`propagate_state(TLE,Time,Frame,State)`

Mode and number of proofs:

`propagate_state(++compound,++nonvar,++atom,--compound)` - `one_or_error`

Exceptions:

`Frame` is not one of the supported reference frame identifiers:

`domain_error(tle_reference_frame,Frame)`

`Time` is not one of the supported time specifications with the required numeric components:

`domain_error(tle_time,Time)`

---

propagate_state/5

Propagates a parsed TLE using the requested propagation model and returns `state(Position,Velocity)` in the requested frame. Velocity is derived directly from the propagated orbital elements in ECI and analytically transformed to the requested frame. Supported models are `approximate`, `approximate_near_earth`, `approximate_deep_space`, and `two_body`.

Compilation flags:

`static`

Template:

`propagate_state(TLE,Time,Frame,Model,State)`

Mode and number of proofs:

`propagate_state(++compound,++nonvar,++atom,++atom,--compound)` - `one_or_error`

Exceptions:

`Frame` is not one of the supported reference frame identifiers:

`domain_error(tle_reference_frame,Frame)`

`Model` is not one of the supported propagation model identifiers:

`domain_error(tle_propagation_model,Model)`

`Time` is not one of the supported time specifications with the required numeric components:

`domain_error(tle_time,Time)`

---

ground_track/5

Samples the propagated sub-satellite ground track between two UTC `date_time/6` instants separated by a positive step size in seconds using the default `approximate` model, returning `sample(DateTime, geographic(Latitude,Longitude,Height))` terms.

Compilation flags:

`static`

Template:

`ground_track(TLE,StartDateTime,EndDateTime,StepSeconds,Samples)`

Mode and number of proofs:

`ground_track(++compound,++compound,++compound,++number,--list(compound))` - `one_or_error`

Exceptions:

`StartDateTime`, `EndDateTime`, or `StepSeconds` do not define a valid ground-track sampling interval for the default model:

`domain_error(tle_ground_track,[StartDateTime,EndDateTime,StepSeconds,approximate])`

---

ground_track/6

Samples the propagated sub-satellite ground track between two UTC `date_time/6` instants separated by a positive step size in seconds using the requested propagation model. Supported models are `approximate`, `approximate_near_earth`, `approximate_deep_space`, and `two_body`.

Compilation flags:

`static`

Template:

`ground_track(TLE,StartDateTime,EndDateTime,StepSeconds,Model,Samples)`

Mode and number of proofs:

`ground_track(++compound,++compound,++compound,++number,++atom,--list(compound))` - `one_or_error`

Exceptions:

`Model` is not one of the supported propagation model identifiers:

`domain_error(tle_propagation_model,Model)`

`StartDateTime`, `EndDateTime`, or `StepSeconds` do not define a valid ground-track sampling interval for the requested model:

`domain_error(tle_ground_track,[StartDateTime,EndDateTime,StepSeconds,Model])`

Public predicates

split_sentences/2

Splits text into sentences using the default options.

Compilation flags:
`static`

Template:
`split_sentences(Text,Sentences)`

Mode and number of proofs:
`split_sentences(+text,-list(text))` - `one_or_error`

Exceptions:
The `Representation` parameter is a variable:
`instantiation_error`
The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:
`domain_error(text_representation,Representation)`
The `Language` parameter is a variable:
`instantiation_error`
The `Language` parameter neither a variable nor an object identifier:
`type_error(object_identifier,Language)`
The `Language` parameter is an object identifier but not an object conforming to `tokenizer_language_protocol`:
`domain_error(tokenizer_language_protocol,Language)`
`Text` is not a ground term:
`instantiation_error`
The `Representation` parameter is `atom` but `Text` is not an atom:
`type_error(atom,Text)`
The `Representation` parameter is `chars` but `Text` is not a list of characters:
`type_error(chars,Text)`
The `Representation` parameter is `codes` but `Text` is not a list of character codes:
`type_error(codes,Text)`

split_sentences/3

Splits text into sentences using the given tokenization options.

Compilation flags:

`static`

Template:

`split_sentences(Text,Sentences,Options)`

Mode and number of proofs:

`split_sentences(+text,-list(text),+list(compound))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Language` parameter is a variable:

`instantiation_error`

The `Language` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Language)`

The `Language` parameter is an object identifier but not an object conforming to `tokenizer_language_protocol`:

`domain_error(tokenizer_language_protocol,Language)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

    type_error(codes,Text)
Options is a variable:
    instantiation_error
Options is neither a variable nor a list:
    type_error(list,Options)
An element Option of the list Options is a variable:
    instantiation_error
An element Option of the list Options is neither a variable nor a compound term:
    type_error(compound,Option)
An element Option of the list Options is a compound term but not a valid option:
    domain_error(option,Option)

---

tokenize_sentences/2

Splits text into sentences and tokenizes each sentence using the default options.

Compilation flags:
    static

Template:
    tokenize_sentences(Text,TokenizedSentences)
Mode and number of proofs:
    tokenize_sentences(+text,-list(list(text))) - one_or_error

Exceptions:
The Representation parameter is a variable:
    instantiation_error
The Representation parameter is neither a variable nor atom, chars, or codes:
    domain_error(text_representation,Representation)
The Language parameter is a variable:

`instantiation_error`

The `Language` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Language)`

The `Language` parameter is an object identifier but not an object conforming to `tokenizer_language_protocol`:

`domain_error(tokenizer_language_protocol,Language)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

`tokenize_sentences/3`

Splits text into sentences and tokenizes each sentence using the given options.

Compilation flags:

`static`

Template:

`tokenize_sentences(Text,TokenizedSentences,Options)`

Mode and number of proofs:

`tokenize_sentences(+text,-list(list(text)),+list(compound))` - `one_or_error`

Exceptions:

The `Representation` parameter is a variable:

`instantiation_error`

The `Representation` parameter is neither a variable nor `atom`, `chars`, or `codes`:

`domain_error(text_representation,Representation)`

The `Language` parameter is a variable:

`instantiation_error`

The `Language` parameter neither a variable nor an object identifier:

`type_error(object_identifier,Language)`

The `Language` parameter is an object identifier but not an object conforming to `tokenizer_language_protocol`:

`domain_error(tokenizer_language_protocol,Language)`

`Text` is not a ground term:

`instantiation_error`

The `Representation` parameter is `atom` but `Text` is not an atom:

`type_error(atom,Text)`

The `Representation` parameter is `chars` but `Text` is not a list of characters:

`type_error(chars,Text)`

The `Representation` parameter is `codes` but `Text` is not a list of character codes:

`type_error(codes,Text)`

`Options` is a variable:

`instantiation_error`

`Options` is neither a variable nor a list:
`type_error(list,Options)`
An element `Option` of the list `Options` is a variable:
`instantiation_error`
An element `Option` of the list `Options` is neither a variable nor a compound term:

Public predicates

(no local declarations; see entity ancestors if any)

Protected predicates

`abbreviation/1`

Enumerates canonical lowercase abbreviations, including their periods.

Compilation flags:
`static`

Template:
`abbreviation(Abbreviation)`
Mode and number of proofs:
`abbreviation(?atom)` - `zero_or_more`

`non_terminal_abbreviation/1`

Enumerates abbreviations that do not terminate a sentence when followed by another token.

Compilation flags:
`static`

Template:
`non_terminal_abbreviation(Abbreviation)`

Mode and number of proofs:

```
non_terminal_abbreviation(?atom) - zero_or_more
```

---

internal_apostrophe/1

Enumerates apostrophe character codes accepted inside words.

Compilation flags:

```
static
```

Template:

```
internal_apostrophe(Code)
```

Mode and number of proofs:

```
internal_apostrophe(?character_code) - zero_or_more
```

---

internal_hyphen/1

Enumerates hyphen character codes accepted inside words.

Compilation flags:

Public predicates

parse/2

Parses TOML content read from the given source (`file(Path)`, `stream(Stream)`, `codes(Codes)`, `chars(Chars)`, or `atom(Atom)`) into a ground term representing the parsed TOML document.

Compilation flags:
`static`

Template:
`parse(Source,TOML)`
Mode and number of proofs:
`parse(++compound,--ground)` - `zero_or_one`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid source:
`domain_error(toml_source,Source)`

---

generate/2

Generates TOML output using the representation specified in the first argument (`file(Path)`, `stream(Stream)`, `codes(Codes)`, `chars(Chars)`, or `atom(Atom)`) from the ground TOML term in the second argument.

Compilation flags:
`static`

Template:
`generate(Sink,TOML)`
Mode and number of proofs:
`generate(++compound,+ground)` - `one_or_error`

Exceptions:
`Sink` is a variable:
`instantiation_error`
`TOML` is a variable:
`instantiation_error`
`TOML` is not a valid TOML term:
`domain_error(toml_term,TOML)`
`Sink` cannot be generated:

Dependencies:
(none)

Remarks:

- Targets and options: Implementing objects should enumerate supported targets using `diagnostic_target/1` and predicates taking an `Options` argument must accept `explanations(Boolean)`.
- Tool metadata predicate: Tool metadata is exposed using `diagnostics_tool/5`.
- Rule descriptor predicate: Rule descriptors are exposed using `diagnostic_rule/5` and collected in stable order using `diagnostic_rules/1`.
- Diagnostic and preflight terms: Findings and analysis prerequisites are represented using `diagnostic/8` and `preflight_issue/7` terms.
- Summary term: Summaries are represented using `diagnostics_summary/5` terms with supporting breakdown and count terms.

Inherited public predicates:

Public predicates

diagnostics_tool/5

Returns tool metadata.

Compilation flags:
`static`

Template:
`diagnostics_tool(Id,Name,Version,InformationURI,Properties)`
Mode and number of proofs:
`diagnostics_tool(?atom,?atom,?atom,?atom,?list(compound))` - `zero_or_one`

---

diagnostic_target/1

Enumerates supported diagnostics target patterns.

Compilation flags:
`static`

Template:
`diagnostic_target(Target)`
Mode and number of proofs:
`diagnostic_target(?nonvar)` - `zero_or_more`

---

diagnostic_rule/5

Enumerates diagnostic rule descriptors.

Compilation flags:
`static`

Template:
`diagnostic_rule(RuleId,ShortDescription,FullDescription,DefaultSeverity,`
`Properties)`
Mode and number of proofs:
`diagnostic_rule(?atom,?atom,?atom,?atom,?list(compound))` - `zero_or_more`

---

diagnostic_rules/1

Returns all supported diagnostic rule descriptors in a stable order.

Compilation flags:
`static`

Template:
`diagnostic_rules(Rules)`
Mode and number of proofs:
`diagnostic_rules(-list(compound))` - `one`

---

diagnostic/3

Enumerates, by backtracking, diagnostics for a target using the given options. Diagnostics are returned using terms of the form `diagnostic(RuleId, Severity, Confidence, Message, Context, File, Lines, Properties)`. All implementations must accept the common option `explanations(Boolean)`.

Compilation flags:
`static`

Template:
`diagnostic(Target,Diagnostic,Options)`
Mode and number of proofs:
`diagnostic(+nonvar,-compound,+list(compound))` - `zero_or_more`

---

diagnostic/2

Enumerates, by backtracking, diagnostics for a target using default options. Diagnostics are returned using terms of the form `diagnostic(RuleId, Severity, Confidence, Message, Context, File, Lines, Properties)`.

Compilation flags:
`static`

Template:
`diagnostic(Target,Diagnostic)`
Mode and number of proofs:
`diagnostic(+nonvar,-compound)` - `zero_or_more`

---

diagnostics/3

Returns an ordered set of diagnostics for a target using the given options. Diagnostics are returned using terms of the form `diagnostic(RuleId, Severity, Confidence, Message, Context, File, Lines, Properties)`. All implementations must accept the common option `explanations(Boolean)`.

Compilation flags:
`static`

Template:
`diagnostics(Target,Diagnostics,Options)`
Mode and number of proofs:
`diagnostics(+nonvar,-list(compound),+list(compound))` - `one`

---

diagnostics/2

Returns an ordered set of diagnostics for a target using default options. Diagnostics are returned using terms of the form `diagnostic(RuleId, Severity, Confidence, Message, Context, File, Lines, Properties)`.

Compilation flags:
`static`

Template:
`diagnostics(Target,Diagnostics)`
Mode and number of proofs:
`diagnostics(+nonvar,-list(compound))` - `one`

---

diagnostics_summary/3

Returns a machine-readable summary for a target using the given options. The summary counts diagnostics only and does not include preflight issues. All implementations must accept the common option `explanations(Boolean)`.

Compilation flags:
`static`

Template:
`diagnostics_summary(Target,Summary,Options)`
Mode and number of proofs:
`diagnostics_summary(+nonvar,-compound,+list(compound))` - `one`

---

diagnostics_summary/2

Returns a machine-readable summary for a target using default options. The summary counts diagnostics only and does not include preflight issues.

Compilation flags:

```
static
```

Template:

```
diagnostics_summary(Target,Summary)
```

Mode and number of proofs:

```
diagnostics_summary(+nonvar,-compound) - one
```

---

diagnostics_preflight/3

Returns an ordered set of machine-readable preflight issues for a target using the given options. Preflight issues are returned using terms of the form `preflight_issue(Id, Severity, Message, Context, File, Lines, Properties)`. All implementations must accept the common option `explanations(Boolean)`.

Compilation flags:

```
static
```

Template:

```
diagnostics_preflight(Target,Issues,Options)
```

Mode and number of proofs:

```
diagnostics_preflight(+nonvar,-list(compound),+list(compound)) - one
```

---

diagnostics_preflight/2

Returns an ordered set of machine-readable preflight issues for a target using default options. Preflight issues are returned using terms of the form `preflight_issue(Id, Severity, Message, Context, File, Lines, Properties)`.

Compilation flags:

```
static
```

Template:

```
diagnostics_preflight(Target,Issues)
```

Mode and number of proofs:

```
diagnostics_preflight(+nonvar,-list(compound)) - one
```

Public predicates

parse/2

Parses the TOON contents read from the given source (`codes(List)`, `stream(Stream)`, `file(Path)`, `chars(List)`, or `atom(Atom)`) into a term. Throws an error if the TOON contents cannot be parsed.

Compilation flags:
`static`

Template:
`parse(Source,Term)`
Mode and number of proofs:
`parse(++compound,--term)` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid source:
`domain_error(toon_source,Source)`

---

generate/2

Generates the content using the representation specified in the first argument (`codes(List)`, `stream(Stream)`, `file(Path)`, `chars(List)`, or `atom(Atom)`) for the term in the second argument. Throws an error if this term cannot be processed.

Compilation flags:
`static`

Template:
`generate(Sink,Term)`
Mode and number of proofs:
`generate(+compound,++term)` - `one_or_error`

Exceptions:
`Sink` is a variable:
`instantiation_error`
`Sink` is neither a variable nor a valid sink:
`domain_error(toon_sink,Sink)`

Public predicates

chr_is/2

Runs a goal against the entity CHR program and returns the resulting constraint store as a conjunction.

Compilation flags:

```
static
```

Template:

```
chr_is(Result,Goal)
```

Mode and number of proofs:

```
chr_is(?nonvar,+callable) - zero_or_one
```

chr_trace/0

Enables the CHR interactive trace debugger. Similar to the trace/0 standard predicate.

Compilation flags:
`static`

Mode and number of proofs:
`chr_trace` - `one`

---

chr_notrace/0

Disables the CHR interactive trace debugger. Similar to the notrace/0 standard predicate.

Compilation flags:
`static`

Mode and number of proofs:
`chr_notrace` - `one`

---

chr_spy/1

Sets a spy point on the activation of constraints matching the given pattern.

Compilation flags:
`static`

Template:
`chr_spy(Pattern)`
Mode and number of proofs:
`chr_spy(@callable)` - `one`

---

chr_nospy/0

Disables all spy points.

Compilation flags:
`static`

Mode and number of proofs:
`chr_nospy` - `one`

---

chr_no_spy/1

Not yet implemented; disables the spy point on constraints matching the given pattern.

Compilation flags:
`static`

Template:
`chr_no_spy(Pattern)`
Mode and number of proofs:
`chr_no_spy(@callable)` - `zero`

---

chr_option/2

Sets a debugger or compiler option. See the file documentation for the supported options and their values.

Compilation flags:
`static`

Template:
`chr_option(Option,Value)`
Mode and number of proofs:
`chr_option(+atom,+atom)` - `zero_or_one`

Protected predicates

current_prog/1

Compiled CHR program generated from the entity chr_constraint, handler, and rules terms.

Compilation flags:
`static`

Template:
`current_prog(Program)`
Mode and number of proofs:
`current_prog(?callable)` - `zero_or_one`

---

chr_option_print_trace/0

True when trace printing is enabled.

Compilation flags:
`dynamic`

Mode and number of proofs:
`chr_option_print_trace` - `zero_or_one`

---

chr_option_trace_interactive/0

True when interactive tracing is enabled.

Compilation flags:
`dynamic`

Mode and number of proofs:
`chr_option_trace_interactive` - `zero_or_one`

---

chr_option_optimization_level/1

Current compiler optimization level.

Compilation flags:
`dynamic`

Template:
`chr_option_optimization_level(Level)`
Mode and number of proofs:
`chr_option_optimization_level(?integer)` - `zero_or_one`

---

chr_option_show_stack/0

True when the execution stack is shown while tracing.

Compilation flags:
`dynamic`

Mode and number of proofs:
`chr_option_show_stack` - `zero_or_one`

---

chr_option_show_store/0

True when the constraint store is shown while tracing.

Compilation flags:
dynamic

Mode and number of proofs:
chr_option_show_store - zero_or_one

---

chr_option_show_history/0

True when the propagation history is shown while tracing.

Compilation flags:
dynamic

Mode and number of proofs:
chr_option_show_history - zero_or_one

---

chr_option_show_id/0

True when the current constraint identifier is shown while tracing.

Compilation flags:
dynamic

Mode and number of proofs:
chr_option_show_id - zero_or_one

---

chr_option_allow_deep_guards/0

True when CHR constraints are allowed in rule guards or if-conditions.

Compilation flags:
dynamic

Mode and number of proofs:
chr_option_allow_deep_guards - zero_or_one

---

chr_next_state/1

Stack length recorded to detect when the next debugger step is reached.

Compilation flags:
`dynamic`

Template:
`chr_next_state(Length)`
Mode and number of proofs:
`chr_next_state(?integer)` - `zero_or_one`

---

chr_spy_point/1

Asserted clause matching constraints on which a spy point is set.

Compilation flags:
`dynamic`

Template:
`chr_spy_point(Constraint)`
Mode and number of proofs:
`chr_spy_point(@callable)` - `zero_or_more`

Private predicates

chr_rule_/1

Asserted CHR rule term collected during term-expansion, consumed when compiling the entity program.

Compilation flags:
`dynamic`

Template:
`chr_rule_(Rule)`
Mode and number of proofs:
`chr_rule_(?callable)` - `zero_or_more`

Operators

(none)

1.332 tries

object

1.332.1 `trie(Representation)`

- `Representation` - String representation. Valid values are `atom`, `codes`, and `chars`.

Persistent trie predicates supporting different string representations.

Availability:
`logtalk_load(tries(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-05

Compilation flags:
`static, context_switching_calls`

Uses:
list
pairs
string(Representation)

Remarks:

Public predicates

new/1

Creates an empty trie.

Compilation flags:
```
static
```

Template:
```
new(Trie)
```
Mode and number of proofs:
```
new(-trie) - one
```

---

as_trie/2

Converts a list of string-value pairs to a trie. When a string occurs multiple times, the last value is retained.

Compilation flags:
```
static
```

Template:
```
as_trie(Pairs,Trie)
```
Mode and number of proofs:
```
as_trie(@list(pairs),-trie) - one
```

---

as_list/2

Converts a trie to a lexicographically ordered list of string-value pairs.

Compilation flags:
```
static
```

Template:
```
as_list(Trie,Pairs)
```
Mode and number of proofs:
```
as_list(@trie,-list(pairs)) - one
```

---

as_list/3

Returns a lexicographically ordered list of all string-value pairs whose strings start with the given prefix. Fails if no string starts with the prefix.

Compilation flags:
```
static
```

Template:
```
as_list(Trie,Prefix,Pairs)
```
Mode and number of proofs:
```
as_list(@trie,+text,-list(pairs)) - zero_or_one
```

---

strings/2

Returns all strings in a trie in lexicographic order.

Compilation flags:
```
static
```

Template:
```
strings(Trie,Strings)
```
Mode and number of proofs:
```
strings(@trie,-list(text)) - one
```

---

strings/3

Returns all strings that start with the given prefix in lexicographic order. Fails if no string starts with the prefix.

Compilation flags:

```
static
```

Template:

```
strings(Trie,Prefix,Strings)
```

Mode and number of proofs:

```
strings(@trie,+text,-list(text)) - zero_or_one
```

---

values/2

Returns all values in lexicographic order of their associated strings.

Compilation flags:

```
static
```

Template:

```
values(Trie,Values)
```

Mode and number of proofs:

```
values(@trie,-list) - one
```

---

values/3

Returns all values associated with strings that start with the given prefix, in lexicographic order of the strings. Fails if no string starts with the prefix.

Compilation flags:

```
static
```

Template:

```
values(Trie,Prefix,Values)
```

Mode and number of proofs:

```
values(@trie,+text,-list) - zero_or_one
```

---

empty/1

True iff the trie is empty.

Compilation flags:
```
static
```

Template:
```
empty(Trie)
```
Mode and number of proofs:
```
empty(@trie) - zero_or_one
```

---

insert/4

Inserts a string-value pair into a trie, returning the updated trie. When the string already exists, its associated value is updated.

Compilation flags:
```
static
```

Template:
```
insert(OldTrie,String,Value,NewTrie)
```
Mode and number of proofs:
```
insert(+trie,+text,@term,-trie) - one
```

---

lookup/3

Looks up a matching string-value pair. With an unbound string, enumerates all pairs in lexicographic order.

Compilation flags:
```
static
```

Template:
```
lookup(String,Value,Trie)
```
Mode and number of proofs:
```
lookup(+text,?term,@trie) - zero_or_one
lookup(-text,?term,@trie) - zero_or_more
```

---

update/4

Updates the value associated with a string, returning the updated trie. Fails if the string is not stored.

Compilation flags:

```
static
```

Template:

```
update(OldTrie,String,NewValue,NewTrie)
```

Mode and number of proofs:

```
update(+trie,+text,+term,-trie) - zero_or_one
```

---

update/5

Updates the value associated with a string, returning the updated trie. Fails if the string is not stored or its value does not unify with the expected old value.

Compilation flags:

```
static
```

Template:

```
update(OldTrie,String,OldValue,NewValue,NewTrie)
```

Mode and number of proofs:

```
update(+trie,+text,?term,+term,-trie) - zero_or_one
```

---

delete/4

Deletes a matching string-value pair, returning the updated trie. Descendant strings are preserved.

Compilation flags:

```
static
```

Template:

```
delete(OldTrie,String,Value,NewTrie)
```

Mode and number of proofs:

```
delete(+trie,+text,?term,-trie) - zero_or_one
```

---

lookup_prefix/4

Enumerates all string-value pairs whose strings start with the given prefix, in lexicographic order.

Compilation flags:
`static`

Template:
`lookup_prefix(Prefix,String,Value,Trie)`
Mode and number of proofs:
`lookup_prefix(+text,-text,?term,@trie)` - `zero_or_more`

---

prefixes/3

Returns all stored string-value pairs whose strings are prefixes of the query, ordered from shortest to longest.

Compilation flags:
`static`

Template:
`prefixes(Trie,Query,Pairs)`
Mode and number of proofs:
`prefixes(@trie,+text,-list(pairs))` - `one`

---

longest_prefix/4

Returns the longest stored string that is a prefix of the query and its associated value. Fails if no stored string is a prefix.

Compilation flags:
`static`

Template:
`longest_prefix(Trie,Query,Prefix,Value)`
Mode and number of proofs:
`longest_prefix(@trie,+text,-text,-term)` - `zero_or_one`

---

delete_prefix/3

Deletes all string-value pairs whose strings start with the given prefix, returning the updated trie. Fails if no string starts with the prefix.

Compilation flags:
`static`

Template:
`delete_prefix(OldTrie,Prefix,NewTrie)`
Mode and number of proofs:
`delete_prefix(+trie,+text,-trie)` - `zero_or_one`

---

size/2

Number of string-value pairs stored in a trie.

Compilation flags:
`static`

Template:
`size(Trie,Size)`
Mode and number of proofs:
`size(@trie,?integer)` - `one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Public predicates

learn/3

Learns a truncated singular value decomposition reducer from the given dataset object using the specified options.

Compilation flags:

```
static
```

Template:

```
learn(Dataset,DimensionReducer,Options)
```

Mode and number of proofs:

```
learn(+object_identifier,-compound,+list(compound)) - one
```

Protected predicates

Public predicates

read_file/3

Reads a TSV file saving the data as clauses for the specified object predicate. Fails if the file cannot be parsed.

Compilation flags:
`static`

Template:
`read_file(File,Object,Predicate)`

Mode and number of proofs:
`read_file(+atom,+object_identifier,+predicate_indicator)` - `zero_or_one`

Exceptions:
`File` is a variable:
`instantiation_error`
`File` is neither a variable nor an atom:
`type_error(atom,File)`
`File` is an atom but not an existing file:
`existence_error(file,File)`
`File` is an existing file but cannot be opened for reading:
`permission_error(open,source_sink,File)`

`Object` is a variable:
`instantiation_error`
`Object` is neither a variable nor an object identifier:
`type_error(object_identifier,Object)`
`Object` is a valid object identifier but not an existing object:
`existence_error(object,Object)`
`Predicate` is a variable:
`instantiation_error`
`Predicate` is neither a variable nor a predicate indicator:
`type_error(predicate_indicator,Predicate)`
`Predicate` is a valid predicate indicator but not an existing public predicate:
`existence_error(predicate,Predicate)`

`read_stream/3`

Reads a TSV stream saving the data as clauses for the specified object predicate. Fails if the stream cannot be parsed.

Compilation flags:
`static`

Template:
`read_stream(Stream,Object,Predicate)`
Mode and number of proofs:
`read_stream(+stream_or_alias,+object_identifier,+predicate_indicator)` - `zero_or_one`

Exceptions:
`Stream` is a variable:
`instantiation_error`
`Stream` is neither a variable nor a stream-term or alias:
`domain_error(stream_or_alias,Stream)`
`Stream` is not an open stream:
`existence_error(stream,Stream)`
`Stream` is an output stream:
`permission_error(input,stream,Stream)`
`Stream` is a binary stream:
`permission_error(input,binary_stream,Stream)`
`Object` is a variable:
`instantiation_error`
`Object` is neither a variable nor an object identifier:
`type_error(object_identifier,Object)`
`Object` is a valid object identifier but not an existing object:
`existence_error(object,Object)`
`Predicate` is a variable:
`instantiation_error`
`Predicate` is neither a variable nor a predicate indicator:
`type_error(predicate_indicator,Predicate)`

`Predicate` is a valid predicate indicator but not an existing public predicate:
`existence_error(predicate,Predicate)`

---

read_file/2

Reads a TSV file returning the data as a list of rows, each row a list of fields. Fails if the file cannot be parsed.

Compilation flags:
`static`

Template:
`read_file(File,Rows)`
Mode and number of proofs:
`read_file(+atom,-list(list))` - `zero_or_one`

Exceptions:
`File` is a variable:
`instantiation_error`
`File` is neither a variable nor an atom:
`type_error(atom,File)`
`File` is an atom but not an existing file:
`existence_error(file,File)`
`File` is an existing file but cannot be opened for reading:
`permission_error(open,source_sink,File)`

---

read_stream/2

Reads a TSV stream returning the data as a list of rows, each row a list of fields. Fails if the stream cannot be parsed.

Compilation flags:
`static`

Template:
`read_stream(Stream,Rows)`
Mode and number of proofs:
`read_stream(+stream_or_alias,-list(list))` - `zero_or_one`

Exceptions:
`Stream` is a variable:
`instantiation_error`
`Stream` is neither a variable nor a stream-term or alias:
`domain_error(stream_or_alias,Stream)`
`Stream` is not an open stream:
`existence_error(stream,Stream)`

`Stream` is an output stream:
```
permission_error(input,stream,Stream)
```
`Stream` is a binary stream:
```
permission_error(input,binary_stream,Stream)
```

`read_file_by_line/3`

Reads a TSV file saving the data as clauses for the specified object predicate. The file is read line by line. Fails if the file cannot be parsed.

Compilation flags:
```
static
```

Template:
```
read_file_by_line(File,Object,Predicate)
```
Mode and number of proofs:
```
read_file_by_line(+atom,+object_identifier,+predicate_indicator) - zero_or_one
```

Exceptions:
`File` is a variable:
```
instantiation_error
```
`File` is neither a variable nor an atom:
```
type_error(atom,File)
```
`File` is an atom but not an existing file:
```
existence_error(file,File)
```
`File` is an existing file but cannot be opened for reading:
```
permission_error(open,source_sink,File)
```
`Object` is a variable:
```
instantiation_error
```
`Object` is neither a variable nor an object identifier:
```
type_error(object_identifier,Object)
```
`Object` is a valid object identifier but not an existing object:
```
existence_error(object,Object)
```
`Predicate` is a variable:
```
instantiation_error
```
`Predicate` is neither a variable nor a predicate indicator:
```
type_error(predicate_indicator,Predicate)
```
`Predicate` is a valid predicate indicator but not an existing public predicate:
```
existence_error(predicate,Predicate)
```

---

read_stream_by_line/3

Reads a TSV stream saving the data as clauses for the specified object predicate. The stream is read line by line. Fails if the stream cannot be parsed.

Compilation flags:

`static`

Template:

`read_stream_by_line(Stream,Object,Predicate)`

Mode and number of proofs:

`read_stream_by_line(+stream_or_alias,+object_identifier,+predicate_indicator)` - `zero_or_one`

Exceptions:

`Stream` is a variable:

`instantiation_error`

`Stream` is neither a variable nor a stream-term or alias:

`domain_error(stream_or_alias,Stream)`

`Stream` is not an open stream:

`existence_error(stream,Stream)`

`Stream` is an output stream:

`permission_error(input,stream,Stream)`

`Stream` is a binary stream:

`permission_error(input,binary_stream,Stream)`

`Object` is a variable:

`instantiation_error`

`Object` is neither a variable nor an object identifier:

`type_error(object_identifier,Object)`

`Object` is a valid object identifier but not an existing object:

`existence_error(object,Object)`

`Predicate` is a variable:

`instantiation_error`

`Predicate` is neither a variable nor a predicate indicator:

`type_error(predicate_indicator,Predicate)`

`Predicate` is a valid predicate indicator but not an existing public predicate:

`existence_error(predicate,Predicate)`

---

read_file_by_line/2

Reads a TSV file returning the data as a list of rows, each row a list of fields. The file is read line by line. Fails if the file cannot be parsed.

Compilation flags:

`static`

Template:

`read_file_by_line(File,Rows)`

Mode and number of proofs:

`read_file_by_line(+atom,-list(list))` - `zero_or_one`

Exceptions:

`File` is a variable:

`instantiation_error`

`File` is neither a variable nor an atom:

`type_error(atom,File)`

`File` is an atom but not an existing file:

`existence_error(file,File)`

`File` is an existing file but cannot be opened for reading:

`permission_error(open,source_sink,File)`

`read_stream_by_line/2`

Reads a TSV stream returning the data as a list of rows, each row a list of fields. The stream is read line by line. Fails if the stream cannot be parsed.

Compilation flags:

`static`

Template:

`read_stream_by_line(Stream,Rows)`

Mode and number of proofs:

`read_stream_by_line(+stream_or_alias,-list(list))` - `zero_or_one`

Exceptions:

`Stream` is a variable:

`instantiation_error`

`Stream` is neither a variable nor a stream-term or alias:

`domain_error(stream_or_alias,Stream)`

`Stream` is not an open stream:

`existence_error(stream,Stream)`

`Stream` is an output stream:

`permission_error(input,stream,Stream)`

`Stream` is a binary stream:

`permission_error(input,binary_stream,Stream)`

---

write_file/3

Writes a TSV file with the data represented by the solutions to the specified object predicate.

Compilation flags:
`static`

Template:
`write_file(File,Object,Predicate)`
Mode and number of proofs:
`write_file(+atom,+object_identifier,+predicate_indicator)` - `one`

Exceptions:
`File` is a variable:
`instantiation_error`
`File` is neither a variable nor an atom:
`type_error(atom,File)`
`File` is an atom but cannot be opened for writing:
`permission_error(open,source_sink,File)`
`Object` is a variable:
`instantiation_error`
`Object` is neither a variable nor an object identifier:
`type_error(object_identifier,Object)`
`Object` is a valid object identifier but not an existing object:
`existence_error(object,Object)`
`Predicate` is a variable:
`instantiation_error`
`Predicate` is neither a variable nor a predicate indicator:
`type_error(predicate_indicator,Predicate)`
`Predicate` is a valid predicate indicator but not an existing public predicate:
`existence_error(predicate,Predicate)`

---

write_stream/3

Writes a TSV stream with the data represented by the solutions to the specified object predicate.

Compilation flags:
`static`

Template:
`write_stream(Stream,Object,Predicate)`
Mode and number of proofs:
`write_stream(+stream_or_alias,+object_identifier,+predicate_indicator)` - `one`

Exceptions:
`Stream` is a variable:
`instantiation_error`

`Stream` is neither a variable nor a stream-term or alias:
`domain_error(stream_or_alias,Stream)`
`Stream` is not an open stream:
`existence_error(stream,Stream)`
`Stream` is an input stream:
`permission_error(output,stream,Stream)`
`Stream` is a binary stream:
`permission_error(output,binary_stream,Stream)`
`Object` is a variable:
`instantiation_error`
`Object` is neither a variable nor an object identifier:
`type_error(object_identifier,Object)`
`Object` is a valid object identifier but not an existing object:
`existence_error(object,Object)`
`Predicate` is a variable:
`instantiation_error`
`Predicate` is neither a variable nor a predicate indicator:
`type_error(predicate_indicator,Predicate)`
`Predicate` is a valid predicate indicator but not an existing public predicate:
`existence_error(predicate,Predicate)`

Public predicates

generate/1

Generates a random TypeID with an empty type prefix. The UUID suffix is a version 7 UUID.

Compilation flags:
`static`

Template:
`generate(TypeID)`
Mode and number of proofs:
`generate(--text) - one`

---

generate/2

Generates a random TypeID with the given type prefix. The UUID suffix is a version 7 UUID. Fails if the prefix is not valid per the TypeID specification.

Compilation flags:
`static`

Template:
`generate(Prefix,TypeID)`
Mode and number of proofs:
`generate(+text,--text) - zero_or_one`

generate/3

Generates a random TypeID with the given type prefix. The UUID suffix is a version 7 UUID computed using the given local UTC offset (`Z` or `+HH:MM`/`-HH:MM`) to convert the backend local time to UTC. Fails if the prefix is not valid per the TypeID specification.

Compilation flags:
`static`

Template:
`generate(Prefix,Offset,TypeID)`
Mode and number of proofs:
`generate(+text,+atom,--text)` - `zero_or_one`

---

from_uuid/3

Returns the TypeID for the given type prefix and UUID. The UUID is not required to be a version 7 UUID, allowing encoding of other UUID versions at the user discretion. Fails if the prefix is not valid per the TypeID specification or if the UUID cannot be parsed.

Compilation flags:
`static`

Template:
`from_uuid(Prefix,UUID,TypeID)`
Mode and number of proofs:
`from_uuid(+text,+text,--text)` - `zero_or_one`

---

to_uuid/2

Returns the UUID encoded in the suffix of the given TypeID. Fails if the TypeID is not valid per the TypeID specification.

Compilation flags:
`static`

Template:
`to_uuid(TypeID,UUID)`
Mode and number of proofs:
`to_uuid(+text,--text)` - `zero_or_one`

---

prefix/2

Returns the type prefix of the given TypeID. Fails if the TypeID is not valid per the TypeID specification.

Compilation flags:

```
static
```

Template:

```
prefix(TypeID,Prefix)
```

Mode and number of proofs:

```
prefix(+text,--text) - zero_or_one
```

---

suffix/2

Returns the base32 encoded UUID suffix of the given TypeID. Fails if the TypeID is not valid per the TypeID specification.

Compilation flags:

```
static
```

Template:

```
suffix(TypeID,Suffix)
```

Mode and number of proofs:

```
suffix(+text,--text) - zero_or_one
```

---

decompose/3

Decomposes a TypeID into its type prefix and its base32 encoded UUID suffix. Fails if the TypeID is not valid per the TypeID specification.

Compilation flags:

```
static
```

Template:

```
decompose(TypeID,Prefix,Suffix)
```

Mode and number of proofs:

```
decompose(+text,--text,--text) - zero_or_one
```

---

compose/3

Composes a TypeID from a type prefix and a base32 encoded UUID suffix. Fails if the prefix or the suffix are not valid per the TypeID specification.

Compilation flags:
`static`

Template:
`compose(Prefix,Suffix,TypeID)`
Mode and number of proofs:
`compose(+text,+text,--text)` - `zero_or_one`

---

valid/1

Succeeds if the given TypeID is valid per the TypeID specification.

Compilation flags:
`static`

Template:
`valid(TypeID)`
Mode and number of proofs:
`valid(+text)` - `zero_or_one`

---

valid_prefix/1

Succeeds if the given type prefix is valid per the TypeID specification.

Compilation flags:
`static`

Template:
`valid_prefix(Prefix)`
Mode and number of proofs:
`valid_prefix(+text)` - `zero_or_one`

---

valid_suffix/1

Succeeds if the given base32 encoded UUID suffix is valid per the TypeID specification.

Compilation flags:
```
static
```

Template:
```
valid_suffix(Suffix)
```
Mode and number of proofs:
```
valid_suffix(+text) - zero_or_one
```

  - *split/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

replace_sub_atom/4

Replaces all occurrences of `Old` by `New` in `Input` returning `Output`. Returns `Input` if `Old` is the empty atom. Fails when `Output` does not unify with the resulting atom.

Compilation flags:

```
static
```

Template:

```
replace_sub_atom(Old,New,Input,Output)
```

Mode and number of proofs:

```
replace_sub_atom(+atom,+atom,+atom,?atom) - zero_or_one
```

---

split/3

Splits an atom at a given delimiter into a list of sub-atoms.

Compilation flags:

```
static
```

Template:

```
split(Atom,Delimiter,SubAtoms)
```

Mode and number of proofs:

```
split(+atom,+atom,-list(atom)) - one
```

Public predicates

is_ascii/1

True if the argument is an ASCII character.

Compilation flags:
`static`

Template:
`is_ascii(Char)`
Mode and number of proofs:
`is_ascii(+char)` - `zero_or_one`

---

is_alphanumeric/1

True if the argument is an alphanumeric character.

Compilation flags:
`static`

Template:
`is_alphanumeric(Char)`
Mode and number of proofs:
`is_alphanumeric(+char)` - `zero_or_one`

---

is_alpha/1

True if the argument is a letter or an underscore.

Compilation flags:
`static`

Template:
`is_alpha(Char)`
Mode and number of proofs:
`is_alpha(+char)` - `zero_or_one`

---

is_letter/1

True if the argument is a letter.

Compilation flags:
`static`

Template:
`is_letter(Char)`
Mode and number of proofs:
`is_letter(+char)` - `zero_or_one`

---

is_bin_digit/1

True if the argument is a binary digit.

Compilation flags:
`static`

Template:
`is_bin_digit(Char)`
Mode and number of proofs:
`is_bin_digit(+char)` - `zero_or_one`

---

is_octal_digit/1

True if the argument is an octal digit.

Compilation flags:
`static`

Template:
`is_octal_digit(Char)`
Mode and number of proofs:
`is_octal_digit(+char)` - `zero_or_one`

---

is_dec_digit/1

True if the argument is a decimal digit.

Compilation flags:
`static`

Template:
`is_dec_digit(Char)`
Mode and number of proofs:
`is_dec_digit(+char)` - `zero_or_one`

---

is_hex_digit/1

True if the argument is an hexadecimal digit.

Compilation flags:
`static`

Template:
`is_hex_digit(Char)`
Mode and number of proofs:
`is_hex_digit(+char)` - `zero_or_one`

---

is_lower_case/1

True if the argument is a lower case letter.

Compilation flags:
`static`

Template:
`is_lower_case(Char)`
Mode and number of proofs:
`is_lower_case(+char)` - `zero_or_one`

---

is_upper_case/1

True if the argument is a upper case letter.

Compilation flags:
`static`

Template:
`is_upper_case(Char)`
Mode and number of proofs:
`is_upper_case(+char)` - `zero_or_one`

---

is_vowel/1

True if the argument is a vowel.

Compilation flags:
`static`

Template:
`is_vowel(Char)`
Mode and number of proofs:
`is_vowel(+char)` - `zero_or_one`

---

is_white_space/1

True if the argument is a white space character (a space or a tab) inside a line of characters.

Compilation flags:
`static`

Template:
`is_white_space(Char)`
Mode and number of proofs:
`is_white_space(+char)` - `zero_or_one`

---

is_layout/1

True if the argument is a layout character.

Compilation flags:
`static`

Template:
`is_layout(Char)`
Mode and number of proofs:
`is_layout(+char)` - `zero_or_one`

---

is_quote/1

True if the argument is a quote character.

Compilation flags:
`static`

Template:
`is_quote(Char)`
Mode and number of proofs:
`is_quote(+char)` - `zero_or_one`

---

is_punctuation/1

True if the argument is a sentence punctuation character.

Compilation flags:
`static`

Template:
`is_punctuation(Char)`
Mode and number of proofs:
`is_punctuation(+char)` - `zero_or_one`

---

is_period/1

True if the argument is a character that ends a sentence.

Compilation flags:
`static`

Template:
`is_period(Char)`
Mode and number of proofs:
`is_period(+char)` - `zero_or_one`

---

is_control/1

True if the argument is an ASCII control character.

Compilation flags:
`static`

Template:
`is_control(Char)`
Mode and number of proofs:
`is_control(+char)` - `zero_or_one`

---

is_newline/1

True if the argument is the ASCII newline character.

Compilation flags:
`static`

Template:
`is_newline(Char)`
Mode and number of proofs:
`is_newline(+char)` - `zero_or_one`

---

is_end_of_line/1

True if the argument is the ASCII end-of-line character (either a carriage return or a line feed).

Compilation flags:
`static`

Template:
`is_end_of_line(Char)`
Mode and number of proofs:
`is_end_of_line(+char)` - `zero_or_one`

---

parenthesis/2

Recognizes and converts between open and close parenthesis.

Compilation flags:
`static`

Template:
`parenthesis(Char1,Char2)`
Mode and number of proofs:
`parenthesis(?char,?char)` - `zero_or_more`
`parenthesis(+char,?char)` - `zero_or_one`
`parenthesis(?char,+char)` - `zero_or_one`

`lower_upper/2`

Recognizes and converts between lower and upper case letters.

Compilation flags:
`static`

Template:
`lower_upper(Char1,Char2)`
Mode and number of proofs:
`lower_upper(?char,?char)` - `zero_or_more`
`lower_upper(+char,?char)` - `zero_or_one`
`lower_upper(?char,+char)` - `zero_or_one`

Public predicates

between/4

Enumerates by backtracking a sequence of `N` equally spaced floats in the interval `[Lower,Upper]`. Assumes `N > 0` and `Lower =< Upper`; fails otherwise.

Compilation flags:

```
static
```

Template:

```
between(Lower,Upper,N,Float)
```

Mode and number of proofs:

```
between(+float,+float,+positive_integer,-float) - zero_or_more
```

---

sequence/4

Generates a list with the sequence of `N` equally spaced floats in the interval `[Lower,Upper]`. Assumes `N > 0` and `Lower =< Upper`; fails otherwise.

Compilation flags:

```
static
```

Template:

```
sequence(Lower,Upper,N,List)
```

Mode and number of proofs:

```
sequence(+float,+float,+positive_integer,-list(float)) - zero_or_one
```

---

sequence/5

Generates a list with the sequence of `Step` spaced floats in the interval `[Lower,Upper]`. Also returns the length of the list. Assumes `Lower =< Upper`; fails otherwise.

Compilation flags:

```
static
```

Template:

```
sequence(Lower,Upper,Step,List,Length)
```

Mode and number of proofs:

```
sequence(+float,+float,+float,-list(float),-positive_integer) - zero_or_one
```

  - *succ/2*
  - *sequence/3*
  - *sequence/4*
  - *power_sequence/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

between/3

Returns integers in the interval defined by the two first arguments.

Compilation flags:

```
static
```

Template:

```
between(Lower,Upper,Integer)
```

Mode and number of proofs:

```
between(+integer,+integer,+integer) - zero_or_one
between(+integer,+integer,-integer) - zero_or_more
```

---

plus/3

Reversible integer sum. At least two of the arguments must be instantiated to integers.

Compilation flags:

```
static
```

Template:

```
plus(I,J,Sum)
```

Mode and number of proofs:

```
plus(+integer,+integer,?integer) - zero_or_one
plus(+integer,?integer,+integer) - zero_or_one
plus(?integer,+integer,+integer) - zero_or_one
```

---

succ/2

Successor of a natural number. At least one of the arguments must be instantiated to a natural number.

Compilation flags:

```
static
```

Template:

```
succ(I,J)
```

Mode and number of proofs:

```
succ(+integer,?integer) - zero_or_one
succ(?integer,+integer) - zero_or_one
```

---

sequence/3

Generates a list with the sequence of all integers in the interval `[Lower,Upper]`. Assumes `Lower =< Upper` and fails otherwise.

Compilation flags:
`static`

Template:
`sequence(Lower,Upper,List)`
Mode and number of proofs:
`sequence(+integer,+integer,-list(integer))` - `zero_or_one`

---

sequence/4

Generates a list with the sequence of integers in the interval `[Lower,Upper]` by `Step`. Assumes `Lower =< Upper, Step >= 1` and fails otherwise.

Compilation flags:
`static`

Template:
`sequence(Lower,Upper,Step,List)`
Mode and number of proofs:
`sequence(+integer,+integer,+integer,-list(integer))` - `zero_or_one`

---

power_sequence/4

Generates a list of exponentiation results given `[Lower,Upper]` sequence of exponents and `Base`. Assumes `Lower =< Upper` and `Base > 1` and fails otherwise.

Compilation flags:
`static`

Template:
`power_sequence(Lower,Upper,Base,List)`
Mode and number of proofs:
`power_sequence(+integer,+integer,+integer,-list(integer))` - `zero_or_one`

Public predicates

append/2

Appends all lists in a list of lists.

Compilation flags:
    `static`

Template:
    `append(Lists,Concatenation)`
Mode and number of proofs:
    `append(+list(list),?list)` - `zero_or_one`

---

append/3

Appends two lists.

Compilation flags:
`static`

Template:
`append(List1,List2,List)`
Mode and number of proofs:
`append(?list,?list,?list)` - `zero_or_more`

---

delete/3

Deletes from a list all occurrences of an element returning the list of remaining elements. Uses `==/2` for element comparison.

Compilation flags:
`static`

Template:
`delete(List,Element,Remaining)`
Mode and number of proofs:
`delete(@list,@term,?list)` - `one`

---

delete_matches/3

Deletes all matching elements from a list, returning the list of remaining elements. Uses `=/2` for element comparison.

Compilation flags:
`static`

Template:
`delete_matches(List,Element,Remaining)`
Mode and number of proofs:
`delete_matches(@list,@term,?list)` - `one`

---

empty/1

True if the argument is an empty list.

Compilation flags:
`static`

Template:
`empty(List)`
Mode and number of proofs:
`empty(@list)` - `zero_or_one`

---

flatten/2

Flattens a list of lists into a list.

Compilation flags:
`static`

Template:
`flatten(List,Flatted)`
Mode and number of proofs:
`flatten(+list,-list)` - `one`

---

hamming_distance/3

Calculates the Hamming distance between two lists (using equality to compare list elements). Fails if the two lists are not of the same length.

Compilation flags:
`static`

Template:
`hamming_distance(List1,List2,Distance)`
Mode and number of proofs:
`hamming_distance(+list,+list,-integer)` - `zero_or_one`

---

keysort/2

Sorts a list of key-value pairs in ascending order.

Compilation flags:
`static`

Template:
`keysort(List,Sorted)`
Mode and number of proofs:
`keysort(+list(pair),-list(pair))` - `one`

---

last/2

List last element (if it exists).

Compilation flags:
`static`

Template:
`last(List,Last)`
Mode and number of proofs:
`last(?list,?term)` - `zero_or_more`

---

length/2

List length.

Compilation flags:
`static`

Template:
`length(List,Length)`
Mode and number of proofs:
`length(?list,?integer)` - `zero_or_more`

---

max/2

Determines the list maximum value using standard order. Fails if the list is empty.

Compilation flags:
```
static
```

Template:
```
max(List,Maximum)
```
Mode and number of proofs:
```
max(+list,-term) - zero_or_one
```

---

member/2

Element is a list member.

Compilation flags:
```
static
```

Template:
```
member(Element,List)
```
Mode and number of proofs:
```
member(?term,?list) - zero_or_more
```

---

memberchk/2

Checks if a term is a member of a list.

Compilation flags:
```
static
```

Template:
```
memberchk(Element,List)
```
Mode and number of proofs:
```
memberchk(?term,?list) - zero_or_one
```

---

min/2

Determines the minimum value in a list using standard order. Fails if the list is empty.

Compilation flags:
```
static
```

Template:
```
min(List,Minimum)
```
Mode and number of proofs:
```
min(+list,-term) - zero_or_one
```

---

msort/2

Sorts a list in ascending order (duplicated elements are not removed).

Compilation flags:
```
static
```

Template:
```
msort(List,Sorted)
```
Mode and number of proofs:
```
msort(+list,-list) - one
```

---

msort/3

Sorts a list using a user-specified comparison predicate modeled on the standard `compare/3` predicate (duplicated elements are not removed).

Compilation flags:
```
static
```

Template:
```
msort(Closure,List,Sorted)
```
Meta-predicate template:
```
msort(3,*,*)
```
Mode and number of proofs:
```
msort(+callable,+list,-list) - one
```

---

nextto/3

`X` and `Y` are consecutive elements in List.

Compilation flags:
`static`

Template:
`nextto(X,Y,List)`
Mode and number of proofs:
`nextto(?term,?term,?list)` - `zero_or_more`

---

nth0/3

Nth element of a list (counting from zero).

Compilation flags:
`static`

Template:
`nth0(Nth,List,Element)`
Mode and number of proofs:
`nth0(?integer,?list,?term)` - `zero_or_more`

---

nth0/4

Nth element of a list (counting from zero). `Rest` is a list of all the other elements. Can be used to either select the nth element of `List` or to insert an element before the nth element in `Rest`.

Compilation flags:
`static`

Template:
`nth0(Nth,List,Element,Rest)`
Mode and number of proofs:
`nth0(?integer,?list,?term,?list)` - `zero_or_more`

---

nth1/3

Nth element of a list (counting from one).

Compilation flags:
`static`

Template:
`nth1(Nth,List,Element)`
Mode and number of proofs:
`nth1(?integer,?list,?term)` - `zero_or_more`

---

nth1/4

Nth element of a list (counting from one). `Rest` is a list of all the other elements. Can be used to either select the nth element of `List` or to insert an element before the nth element in `Rest`.

Compilation flags:
`static`

Template:
`nth1(Nth,List,Element,Rest)`
Mode and number of proofs:
`nth1(?integer,?list,?term,?list)` - `zero_or_more`

---

sequential_occurrences/2

Counts the number of sequential occurrences of each `List` element, unifying `Occurrences` with a list of `Element-Count` pairs. Uses term equality for element comparison.

Compilation flags:
`static`

Template:
`sequential_occurrences(List,Occurrences)`
Mode and number of proofs:
`sequential_occurrences(@list,-list(pair(term,positive_integer)))` - `one`

---

sequential_occurrences/3

Counts the number of sequential occurrences of each `List` element, unifying `Occurrences` with a list of `Element-Count` pairs. Uses `Closure` for element comparison.

Compilation flags:
`static`

Template:
`sequential_occurrences(List,Closure,Occurrences)`
Mode and number of proofs:
`sequential_occurrences(@list,@callable,-list(pair(term,positive_integer)))` - `one`

---

occurrences/2

Counts the number of occurrences of each `List` element, unifying `Occurrences` with a sorted list of `Element-Count` pairs. Uses term equality for element comparison.

Compilation flags:
`static`

Template:
`occurrences(List,Occurrences)`
Mode and number of proofs:
`occurrences(@list,-list(pair(term,positive_integer)))` - `one`

---

occurrences/3

Counts the number of occurrences of each `List` element, unifying `Occurrences` with a sorted list of `Element-Count` pairs. Uses `Closure` for element comparison.

Compilation flags:
`static`

Template:
`occurrences(List,Closure,Occurrences)`
Meta-predicate template:
`occurrences(*,2,*)`
Mode and number of proofs:
`occurrences(@list,@callable,-list(pair(term,positive_integer)))` - `one`

---

partition/5

Partitions a list in lists with values less, equal, and greater than a given value (using standard order).

Compilation flags:
`static`

Template:
`partition(List,Value,Less,Equal,Greater)`
Mode and number of proofs:
`partition(+list,+number,-list,-list,-list)` - `one`

---

permutation/2

The two lists are a permutation of the same list.

Compilation flags:
`static`

Template:
`permutation(List,Permutation)`
Mode and number of proofs:
`permutation(?list,?list)` - `zero_or_more`

---

prefix/2

`Prefix` is a prefix of `List`.

Compilation flags:
`static`

Template:
`prefix(Prefix,List)`
Mode and number of proofs:
`prefix(?list,+list)` - `zero_or_more`

---

prefix/3

`Prefix` is a prefix of length `Length` of `List`.

Compilation flags:
`static`

Template:
`prefix(Prefix,Length,List)`
Mode and number of proofs:
`prefix(?list,+integer,+list)` - `zero_or_one`
`prefix(?list,-integer,+list)` - `zero_or_more`

---

proper_prefix/2

`Prefix` is a proper prefix of `List`.

Compilation flags:
`static`

Template:
`proper_prefix(Prefix,List)`
Mode and number of proofs:
`proper_prefix(?list,+list)` - `zero_or_more`

---

proper_prefix/3

`Prefix` is a proper prefix of length `Length` of `List`.

Compilation flags:
`static`

Template:
`proper_prefix(Prefix,Length,List)`
Mode and number of proofs:
`proper_prefix(?list,+integer,+list)` - `zero_or_one`
`proper_prefix(?list,-integer,+list)` - `zero_or_more`

---

remove_duplicates/2

Removes duplicated list elements using equality (==/2) for comparison and keeping the left-most element when repeated.

Compilation flags:
```
static
```

Template:
```
remove_duplicates(List,Set)
```
Mode and number of proofs:
```
remove_duplicates(+list,-list) - one
```

---

reverse/2

Reverses a list.

Compilation flags:
```
static
```

Template:
```
reverse(List,Reversed)
```
Mode and number of proofs:
```
reverse(+list,?list) - zero_or_one
reverse(?list,+list) - zero_or_one
reverse(-list,-list) - one_or_more
```

---

same_length/2

The two lists have the same length.

Compilation flags:
```
static
```

Template:
```
same_length(List1,List2)
```
Mode and number of proofs:
```
same_length(+list,?list) - zero_or_one
same_length(?list,+list) - zero_or_one
same_length(-list,-list) - one_or_more
```

---

same_length/3

The two lists have the same length.

Compilation flags:
```
static
```

Template:
```
same_length(List1,List2,Length)
```
Mode and number of proofs:
```
same_length(+list,?list,?integer) - zero_or_one
same_length(?list,+list,?integer) - zero_or_one
same_length(-list,-list,-integer) - one_or_more
```

---

select/3

Selects an element from a list, returning the list of remaining elements.

Compilation flags:
```
static
```

Template:
```
select(Element,List,Remaining)
```
Mode and number of proofs:
```
select(?term,?list,?list) - zero_or_more
```

---

selectchk/3

Checks that an element can be selected from a list, returning the list of remaining elements.

Compilation flags:
```
static
```

Template:
```
selectchk(Element,List,Remaining)
```
Mode and number of proofs:
```
selectchk(?term,?list,?list) - zero_or_one
```

---

select/4

Selects an element from a list, replacing it by a new element and returning the resulting list.

Compilation flags:
`static`

Template:
`select(Old,OldList,New,NewList)`
Mode and number of proofs:
`select(?term,?list,?term,?list)` - `zero_or_more`

---

selectchk/4

Checks that an element from a list can be replaced by a new element, returning the resulting list.

Compilation flags:
`static`

Template:
`selectchk(Old,OldList,New,NewList)`
Mode and number of proofs:
`selectchk(?term,?list,?term,?list)` - `zero_or_one`

---

sort/2

Sorts a list in ascending order (duplicated elements are removed).

Compilation flags:
`static`

Template:
`sort(List,Sorted)`
Mode and number of proofs:
`sort(+list,-list)` - `one`

---

sort/3

Sorts a list using a user-specified comparison predicate modeled on the standard `compare/3` predicate (duplicated elements are removed).

Compilation flags:
`static`

Template:
`sort(Closure,List,Sorted)`
Meta-predicate template:
`sort(3,*,*)`
Mode and number of proofs:
`sort(+callable,+list,-list)` - `one`

---

sort/4

Sorts a list using the given key and order. Uses the standard term comparison operators for the order. The key selects the argument in each element in the list to use for comparisons. A key value of zero uses the whole element for comparisons.

Compilation flags:
`static`

Template:
`sort(Key,Order,List,Sorted)`
Mode and number of proofs:
`sort(+non_negative_integer,+atom,+list,-list)` - `one`

Remarks:

- Removing duplicates: Use one of the `@<` or `@>` orders.
- Keeping duplicates: Use one of the `@=<` or `@>=` orders.
- Sorting in ascending order: Use one of the `@<` or `@=<` orders.
- Sorting in descending order: Use one of the `@>` or `@>=` orders.

---

split/4

Splits a list into sublists of a given length. Also returns a list with the remaining elements. Fails if the length is zero or negative.

Compilation flags:
`static`

Template:
`split(List,Length,Sublists,Remaining)`
Mode and number of proofs:
`split(+list,+integer,-list(list),-list)` - `zero_or_one`

---

sublist/2

The first list is a sublist of the second.

Compilation flags:
`static`

Template:
`sublist(Sublist,List)`
Mode and number of proofs:
`sublist(?list,+list)` - `zero_or_more`

---

subsequence/3

`List` is an interleaving of `Subsequence` and `Remaining`. Element order is preserved.

Compilation flags:
`static`

Template:
`subsequence(List,Subsequence,Remaining)`
Mode and number of proofs:
`subsequence(?list,?list,?list)` - `zero_or_more`

---

subsequence/4

Generates subsequences of a given length from a list. Also returns the remaining elements. Element order is preserved.

Compilation flags:
`static`

Template:
`subsequence(List,Length,Subsequence,Remaining)`
Mode and number of proofs:
`subsequence(+list,+integer,?list,?list)` - `zero_or_more`

---

substitute/4

Substitutes all occurrences of `Old` in `List` by `New`, returning `NewList`. Uses term equality for element comparison.

Compilation flags:
`static`

Template:
`substitute(Old,List,New,NewList)`
Mode and number of proofs:
`substitute(@term,@list,@term,-list)` - `one`

---

subtract/3

Removes all elements in the second list from the first list, returning the list of remaining elements.

Compilation flags:
`static`

Template:
`subtract(List,Elements,Remaining)`
Mode and number of proofs:
`subtract(+list,+list,-list)` - `one`

---

suffix/2

Suffix is a suffix of List.

Compilation flags:
`static`

Template:
`suffix(Suffix,List)`
Mode and number of proofs:
`suffix(?list,+list)` - `zero_or_more`

---

suffix/3

`Suffix` is a suffix of length `Length` of `List`.

Compilation flags:
`static`

Template:
`suffix(Suffix,Length,List)`
Mode and number of proofs:
`suffix(?list,+integer,+list)` - `zero_or_one`
`suffix(?list,-integer,+list)` - `zero_or_more`

---

proper_suffix/2

`Suffix` is a proper suffix of `List`.

Compilation flags:
`static`

Template:
`proper_suffix(Suffix,List)`
Mode and number of proofs:
`proper_suffix(?list,+list)` - `zero_or_more`

---

proper_suffix/3

`Suffix` is a proper suffix of length `Length` of `List`.

Compilation flags:
`static`

Template:
`proper_suffix(Suffix,Length,List)`
Mode and number of proofs:
`proper_suffix(?list,+integer,+list)` - `zero_or_one`
`proper_suffix(?list,-integer,+list)` - `zero_or_more`

---

take/3

Takes the first N elements of a list. Fails if the list have fewer than N elements.

Compilation flags:
`static`

Template:
`take(N,List,Elements)`
Mode and number of proofs:
`take(+integer,+list,-list)` - `zero_or_one`

---

take/4

Takes the first N elements of a list (i.e., splits a list after its first N elements). Fails if the list have fewer than N elements.

Compilation flags:
`static`

Template:
`take(N,List,Prefix,Suffix)`
Mode and number of proofs:
`take(+integer,+list,-list,-list)` - `zero_or_one`

---

drop/3

Drops the first N elements of a list. Fails if the list have fewer than N elements.

Compilation flags:
`static`

Template:
`drop(N,List,Remaining)`
Mode and number of proofs:
`drop(+integer,+list,-list)` - `zero_or_one`

Public predicates

factorial/2

Computes the factorial of a non-negative integer.

Compilation flags:
`static`

Template:
`factorial(N,Factorial)`

Mode and number of proofs:
`factorial(+non_negative_integer,-non_negative_integer)` - `one`

---

fibonacci/2

Computes the Fibonacci number of a non-negative integer.

Compilation flags:
`static`

Template:
`fibonacci(N,Fibonacci)`

Mode and number of proofs:
`fibonacci(+non_negative_integer,-non_negative_integer)` - `one`

---

lucas/2

Computes the Lucas number of a non-negative integer.

Compilation flags:
`static`

Template:
`lucas(N,Lucas)`
Mode and number of proofs:
`lucas(+non_negative_integer,-non_negative_integer)` - `one`

---

falling_factorial/3

Computes the falling factorial. `N` must be greater than or equal to `K` (fails otherwise).

Compilation flags:
`static`

Template:
`falling_factorial(N,K,FallingFactorial)`
Mode and number of proofs:
`falling_factorial(+non_negative_integer,+non_negative_integer,`
`-non_negative_integer)` - `zero_or_one`

---

rising_factorial/3

Computes the rising factorial.

Compilation flags:
`static`

Template:
`rising_factorial(N,K,RisingFactorial)`
Mode and number of proofs:
`rising_factorial(+non_negative_integer,+non_negative_integer,`
`-non_negative_integer)` - `one`

---

catalan/2

Computes the Catalan number of a non-negative integer.

Compilation flags:
```
static
```

Template:
```
catalan(N,Catalan)
```
Mode and number of proofs:
```
catalan(+non_negative_integer,-non_negative_integer) - one
```

---

subfactorial/2

Computes the subfactorial of a non-negative integer.

Compilation flags:
```
static
```

Template:
```
subfactorial(N,Subfactorial)
```
Mode and number of proofs:
```
subfactorial(+non_negative_integer,-non_negative_integer) - one
```

---

bell/2

Computes the Bell number of a non-negative integer.

Compilation flags:
```
static
```

Template:
```
bell(N,Bell)
```
Mode and number of proofs:
```
bell(+non_negative_integer,-non_negative_integer) - one
```

---

stirling_first/3

Computes the unsigned Stirling number of the first kind. N must be greater than or equal to K (fails otherwise).

Compilation flags:
static

Template:
stirling_first(N,K,Stirling)
Mode and number of proofs:
stirling_first(+non_negative_integer,+non_negative_integer,-non_negative_integer) - zero_or_one

---

stirling_second/3

Computes the Stirling number of the second kind. N must be greater than or equal to K (fails otherwise).

Compilation flags:
static

Template:
stirling_second(N,K,Stirling)
Mode and number of proofs:
stirling_second(+non_negative_integer,+non_negative_integer,
-non_negative_integer) - zero_or_one

---

partition_number/2

Computes the partition number of a non-negative integer.

Compilation flags:
static

Template:
partition_number(N,PartitionNumber)
Mode and number of proofs:
partition_number(+non_negative_integer,-non_negative_integer) - one

---

binomial/3

Computes the binomial coefficient. `N` must be greater than or equal to `K` (fails otherwise).

Compilation flags:
`static`

Template:
`binomial(N,K,Binomial)`
Mode and number of proofs:
`binomial(+non_negative_integer,+non_negative_integer,-non_negative_integer)` - `zero_or_one`

---

multinomial/2

Computes the multinomial coefficient for a list of non-negative integers.

Compilation flags:
`static`

Template:
`multinomial(Integers,Multinomial)`
Mode and number of proofs:
`multinomial(+list(non_negative_integer),-non_negative_integer)` - `one`

  - *=~= / 2*
- *Protected predicates*
- *Private predicates*
- *Operators*
  - *op(700,xfx,=~=)*

Public predicates

approximately_equal/2

Compares two numbers for approximate equality given the `epsilon` arithmetic constant value using the de facto standard formula `abs(Number1 - Number2) =< max(abs(Number1), abs(Number2)) * epsilon`. No type-checking.

Compilation flags:
`static`

Template:
`approximately_equal(Number1,Number2)`
Mode and number of proofs:
`approximately_equal(+number,+number)` - `zero_or_one`

approximately_equal/3

Compares two numbers for approximate equality given a user-defined epsilon value using the de facto standard formula `abs(Number1 - Number2) =< max(abs(Number1), abs(Number2)) * Epsilon`. No type-checking.

Compilation flags:

```
static
```

Template:

```
approximately_equal(Number1,Number2,Epsilon)
```

Mode and number of proofs:

```
approximately_equal(+number,+number,+number) - zero_or_one
```

Remarks:

- Epsilon range: Epsilon should be the `epsilon` arithmetic constant value or a small multiple of it. Only use a larger value if a greater error is expected.
- Comparison with essential equality: For the same epsilon value, approximate equality is weaker requirement than essential equality.

---

essentially_equal/3

Compares two numbers for essential equality given an epsilon value using the de facto standard formula abs(Number1 - Number2) =< min(abs(Number1), abs(Number2)) * Epsilon. No type-checking.

Compilation flags:

```
static
```

Template:

```
essentially_equal(Number1,Number2,Epsilon)
```

Mode and number of proofs:

```
essentially_equal(+number,+number,+number) - zero_or_one
```

Remarks:

- Comparison with approximate equality: For the same epsilon value, essential equality is a stronger requirement than approximate equality.

---

tolerance_equal/4

Compares two numbers for close equality given relative and absolute tolerances using the de facto standard formula abs(Number1 - Number2) =< max(RelativeTolerance * max(abs(Number1), abs(Number2)), AbsoluteTolerance). No type-checking.

Compilation flags:

```
static
```

Template:

```
tolerance_equal(Number1,Number2,RelativeTolerance,AbsoluteTolerance)
```

Mode and number of proofs:

`tolerance_equal(+number,+number,+number,+number)` - `zero_or_one`

`=~= / 2`

Compares two floats (or lists of floats) for approximate equality using 100*epsilon for the absolute error and, if that fails, 99.999% accuracy for the relative error. Note that these precision values may not be adequate for all cases. No type-checking.

Compilation flags:

`static`

Template:

`=~=(Float1,Float2)`

Mode and number of proofs:

`=~=(+number,+number)` - `zero_or_one`

`=~=(+list(number),+list(number))` - `zero_or_one`

Public predicates

min/2

Determines the minimum value in a list using arithmetic order. Fails if the list is empty.

Compilation flags:
`static`

Template:
`min(List,Minimum)`

Mode and number of proofs:
`min(+list(number),-number)` - `zero_or_one`

---

max/2

Determines the list maximum value using arithmetic order. Fails if the list is empty.

Compilation flags:
`static`

Template:
`max(List,Maximum)`

Mode and number of proofs:
`max(+list(number),-number)` - `zero_or_one`

---

min_max/3

Determines the minimum and maximum values in a list using arithmetic order. Fails if the list is empty.

Compilation flags:
`static`

Template:
`min_max(List,Minimum,Maximum)`
Mode and number of proofs:
`min_max(+list(number),-number,-number)` - `zero_or_one`

---

product/2

Calculates the product of all list numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`product(List,Product)`
Mode and number of proofs:
`product(+list(number),-number)` - `zero_or_one`

---

sum/2

Calculates the sum of all list numbers. Returns the integer zero if the list is empty.

Compilation flags:
`static`

Template:
`sum(List,Sum)`
Mode and number of proofs:
`sum(+list(number),-number)` - `one`

---

average/2

Calculates the average (i.e., arithmetic mean) of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`average(List,Average)`
Mode and number of proofs:
`average(+list(number),-float)` - `zero_or_one`

---

median/2

Calculates the median of a list of numbers. Fails if the list is empty.

Compilation flags:
`static`

Template:
`median(List,Median)`
Mode and number of proofs:
`median(+list(number),-float)` - `zero_or_one`

---

modes/2

Returns the list of modes of a list of numbers in ascending order. Fails if the list is empty.

Compilation flags:
`static`

Template:
`modes(List,Modes)`
Mode and number of proofs:
`modes(+list(number),-list(number))` - `zero_or_one`

---

euclidean_norm/2

Calculates the Euclidean norm of a list of numbers. Fails if the list is empty.

Compilation flags:
```
static
```

Template:
```
euclidean_norm(List,Norm)
```
Mode and number of proofs:
```
euclidean_norm(+list(number),-float) - zero_or_one
```

---

chebyshev_norm/2

Calculates the Chebyshev norm of a list of numbers. Fails if the list is empty.

Compilation flags:
```
static
```

Template:
```
chebyshev_norm(List,Norm)
```
Mode and number of proofs:
```
chebyshev_norm(+list(integer),-integer) - zero_or_one
chebyshev_norm(+list(float),-float) - zero_or_one
```

---

manhattan_norm/2

Calculates the Manhattan norm of a list of numbers. Fails if the list is empty.

Compilation flags:
```
static
```

Template:
```
manhattan_norm(List,Norm)
```
Mode and number of proofs:
```
manhattan_norm(+list(integer),-integer) - zero_or_one
manhattan_norm(+list(float),-float) - zero_or_one
```

---

euclidean_distance/3

Calculates the Euclidean distance between two lists of numbers. Fails if the two lists are empty or not of the same length.

Compilation flags:

```
static
```

Template:

```
euclidean_distance(List1,List2,Distance)
```

Mode and number of proofs:

```
euclidean_distance(+list(number),+list(number),-float) - zero_or_one
```

---

chebyshev_distance/3

Calculates the Chebyshev distance between two lists of numbers. Fails if the two lists are empty or not of the same length.

Compilation flags:

```
static
```

Template:

```
chebyshev_distance(List1,List2,Distance)
```

Mode and number of proofs:

```
chebyshev_distance(+list(integer),+list(integer),-integer) - zero_or_one
chebyshev_distance(+list(float),+list(float),-float) - zero_or_one
```

---

manhattan_distance/3

Calculates the Manhattan distance between two lists of numbers. Fails if the two lists are empty or not of the same length.

Compilation flags:

```
static
```

Template:

```
manhattan_distance(List1,List2,Distance)
```

Mode and number of proofs:

```
manhattan_distance(+list(integer),+list(integer),-integer) - zero_or_one
manhattan_distance(+list(float),+list(float),-float) - zero_or_one
```

---

minkowski_distance/4

Calculates the Minkowski distance between two lists of numbers given a positive power. Fails if the two lists are empty or not of the same length.

Compilation flags:

```
static
```

Template:

```
minkowski_distance(List1,List2,Power,Distance)
```

Mode and number of proofs:

```
minkowski_distance(+list(number),+list(number),+number,-float) - zero_or_one
```

---

scalar_product/3

Calculates the scalar product of two lists of numbers. Fails if the two lists are empty or not of the same length.

Compilation flags:

```
static
```

Template:

```
scalar_product(List1,List2,Product)
```

Mode and number of proofs:

```
scalar_product(+list(integer),+list(integer),-integer) - zero_or_one
scalar_product(+list(float),+list(float),-float) - zero_or_one
```

---

normalize_range/2

Normalizes a list of numbers into the `[0.0,1.0]` range. Caller must handle arithmetic exceptions if the input list if not normalizable.

Compilation flags:

```
static
```

Template:

```
normalize_range(List,NormalizedList)
```

Mode and number of proofs:

```
normalize_range(+list(number),-list(float)) - one
```

---

normalize_range/4

Normalizes a list of numbers into the given range. Caller must handle arithmetic exceptions if the input list if not normalizable.

Compilation flags:

```
static
```

Template:

```
normalize_range(List,Minimum,Maximum,NormalizedList)
```

Mode and number of proofs:

```
normalize_range(+list(number),+number,+number,-list(float)) - one
```

---

normalize_unit/2

Normalizes a list of numbers returning its unit vector (i.e., a list with Euclidean norm equal to one). Caller must handle arithmetic exceptions if the input list if not normalizable.

Compilation flags:

```
static
```

Template:

```
normalize_unit(List,NormalizedList)
```

Mode and number of proofs:

```
normalize_unit(+list(number),-list(float)) - one
```

---

normalize_scalar/2

Normalizes a list of numbers such that the sum of all numbers is equal to one. Caller must handle arithmetic exceptions if the input list if not normalizable.

Compilation flags:

```
static
```

Template:

```
normalize_scalar(List,NormalizedList)
```

Mode and number of proofs:

```
normalize_scalar(+list(number),-list(float)) - one
```

---

rescale/3

Rescales all numbers in a list by the given factor.

Compilation flags:
```
static
```

Template:
```
rescale(List,Factor,RescaledList)
```
Mode and number of proofs:
```
rescale(+list(integer),+integer,-list(integer)) - one
rescale(+list(number),+float,-list(float)) - one
```

---

least_common_multiple/2

Computes the least common multiple of a list of two or more positive integers. Fails if the list is empty or contains a single element. Fails also if any of the elements is zero. May require backend support for unbound integer arithmetic.

Compilation flags:
```
static
```

Template:
```
least_common_multiple(Integers,LeastCommonMultiple)
```
Mode and number of proofs:
```
least_common_multiple(+list(positive_integer),-positive_integer) - zero_or_one
```

---

softmax/2

Computes the softmax of a list of floats, returning a probability distribution. The implementation is numerically stable.

Compilation flags:
```
static
```

Template:
```
softmax(Floats,Softmax)
```
Mode and number of proofs:
```
softmax(+list(float),-list(float)) - one
```

---

softmax/3

Computes the softmax of a list of floats with the given temperature, returning a probability distribution. The implementation is numerically stable.

Compilation flags:

```
static
```

Template:

```
softmax(Floats,Temperature,Softmax)
```

Mode and number of proofs:

```
softmax(+list(float),+positive_float,-list(float)) - one
```

Remarks:

- `Temperature > 1.0`: Makes the distribution more uniform.
- `Temperature < 1.0`: Makes the distribution more concentrated on the largest values.
- `Temperature = 1.0`: Standard softmax behavior.

---

linear_regression/4

Computes the simple linear regression for the given lists of X and Y coordinates, returning the slope and the intercept. Fails if the lists have less than two elements, are not of the same length, or if all X values are the same.

Compilation flags:

```
static
```

Template:

```
linear_regression(Xs,Ys,Slope,Intercept)
```

Mode and number of proofs:

```
linear_regression(+list(number),+list(number),-float,-float) - zero_or_one
```

- *Operators*

Public predicates

keys_values/3

Converts between a list of pairs and lists of keys and values. When converting to pairs, this predicate fails if the list of keys and the list of values have different lengths.

Compilation flags:

```
static
```

Template:

```
keys_values(Pairs,Keys,Values)
```

Mode and number of proofs:

```
keys_values(+list(pair),-list,-list) - one
keys_values(-list(pair),+list,+list) - zero_or_one
```

---

keys/2

Returns a list of keys from a list of pairs.

Compilation flags:

```
static
```

Template:

```
keys(Pairs,Keys)
```

Mode and number of proofs:

```
keys(+list(pair),-list) - one
```

---

key/2

Enumerates by backtracking all keys from a list of pairs.

Compilation flags:

```
static
```

Template:

```
key(Pairs,Key)
```

Mode and number of proofs:

```
key(+list(pair),-term) - zero_or_more
```

---

values/2

Returns a list of values from a list of pairs.

Compilation flags:
```
static
```

Template:
```
values(Pairs,Values)
```
Mode and number of proofs:
```
values(+list(pair),-list) - one
```

---

value/3

Returns a value addressed by the given path (a key or a list of keys in the case of nested list of pairs). Fails if path does not exist.

Compilation flags:
```
static
```

Template:
```
value(Pairs,Path,Value)
```
Mode and number of proofs:
```
value(+list(pair),+term,-term) - zero_or_one
value(+list(pair),+list,-term) - zero_or_one
```

---

transpose/2

Transposes a list of pairs by swapping each pair key and value. The relative order of the list elements is kept.

Compilation flags:
```
static
```

Template:
```
transpose(Pairs,TransposedPairs)
```
Mode and number of proofs:
```
transpose(+list(pair),-list(pair)) - one
```

---

group_sorted_by_key/2

Groups pairs by key by sorting them and then constructing new pairs by grouping all values for a given key in a list. Keys are compared using equality. Relative order of values per key is kept. Resulting list of pairs is sorted by key.

Compilation flags:

```
static
```

Template:

```
group_sorted_by_key(Pairs,Groups)
```

Mode and number of proofs:

```
group_sorted_by_key(+list(pair),-list(pair)) - one
```

---

group_consecutive_by_key/2

Groups pairs by constructing new pairs by grouping all values for consecutive key in a list. Keys are compared using equality. The relative order of the values for the same key is kept.

Compilation flags:

```
static
```

Template:

```
group_consecutive_by_key(Pairs,Groups)
```

Mode and number of proofs:

```
group_consecutive_by_key(+list(pair),-list(pair)) - one
```

---

group_by_key/2

Same as the `group_sorted_by_key/2` predicate. Deprecated.

Compilation flags:

```
static
```

Template:

```
group_by_key(Pairs,Groups)
```

Mode and number of proofs:

```
group_by_key(+list(pair),-list(pair)) - one
```

`map/3`

Maps a list into pairs using a closure that applies to each list element to compute its key.

Compilation flags:
`static`

Template:
`map(Closure,List,Pairs)`
Meta-predicate template:
`map(2,*,*)`
Mode and number of proofs:
`map(@callable,+list,-list(pair))` - `one`

Public predicates

depth/2

True if the depth of `Term` is `Depth`. The depth of atomic terms is zero; the depth of a compound term is one plus the maximum depth of its sub-terms.

Compilation flags:
`static`

Template:
`depth(Term,Depth)`

Mode and number of proofs:
`depth(@term,?integer)` - `zero_or_one`

---

ground/1

True if the argument is ground. Deprecated. Use the `ground/1` standard predicate instead.

Compilation flags:
`static`

Template:
`ground(Term)`

Mode and number of proofs:

```
ground(@term) - zero_or_one
```

---

new/1

Creates a new term instance (if meaningful).

Compilation flags:

```
static
```

Template:

```
new(Term)
```

Mode and number of proofs:

```
new(-nonvar) - zero_or_one
```

---

occurs/2

True if the variable occurs in the term.

Compilation flags:

```
static
```

Template:

```
occurs(Variable,Term)
```

Mode and number of proofs:

```
occurs(@var,@term) - zero_or_one
```

---

subsumes/2

The first term subsumes the second term. Deprecated. Use the `subsumes_term/2` standard predicate instead.

Compilation flags:

```
static
```

Template:

```
subsumes(General,Specific)
```

Mode and number of proofs:

```
subsumes(@term,@term) - zero_or_one
```

---

subterm/2

The first term is a subterm of the second term.

Compilation flags:
`static`

Template:
`subterm(Subterm,Term)`
Mode and number of proofs:
`subterm(?term,+term)` - `zero_or_more`

---

valid/1

Term is valid.

Compilation flags:
`static`

Template:
`valid(Term)`
Mode and number of proofs:
`valid(@nonvar)` - `zero_or_one`

---

check/1

Checks if a term is valid. Throws an exception if the term is not valid.

Compilation flags:
`static`

Template:
`check(Term)`
Mode and number of proofs:
`check(@nonvar)` - `one`

---

variant/2

Each term is a variant of the other (i.e., they are structurally equivalent).

Compilation flags:
```
static
```

Template:
```
variant(Term1,Term2)
```
Mode and number of proofs:
```
variant(@term,@term) - zero_or_one
```

---

variables/2

Returns a list of all term variables (ordered as found when doing a depth-first, left-to-right traversal of `Term`). Deprecated. Use the standard `term_variables/2` predicate instead.

Compilation flags:
```
static
```

Template:
```
variables(Term,List)
```
Mode and number of proofs:
```
variables(@term,-list) - one
```

---

singletons/2

Returns a list of all term singleton variables (ordered as found when doing a depth-first, left-to-right traversal of `Term`).

Compilation flags:
```
static
```

Template:
```
singletons(Term,Singletons)
```
Mode and number of proofs:
```
singletons(@term,-list) - one
```

---

numbervars/3

Grounds a term by replacing all variables with `'$VAR'(N)` terms with `N` starting at `From`. The `Next` argument is unified with the next value for `N` after binding all variables.

Compilation flags:

`static`

Template:

`numbervars(Term,From,Next)`

Mode and number of proofs:

`numbervars(?term,+integer,?integer)` - `zero_or_one`

---

numbervars/1

Grounds a term by replacing all variables with `'$VAR'(N)` terms with `N` starting at `0`.

Compilation flags:

`static`

Template:

`numbervars(Term)`

Mode and number of proofs:

`numbervars(?term)` - `zero_or_one`

---

varnumbers/3

Replaces all `'$VAR'(N)` sub-terms in a term with fresh variables for all values of `N` grater or equal to `From`. Variables in `Term` are shared with `Copy`.

Compilation flags:

`static`

Template:

`varnumbers(Term,From,Copy)`

Mode and number of proofs:

`varnumbers(@term,+integer,?term)` - `zero_or_one`

---

varnumbers/2

Replaces all '$VAR'(N) sub-terms in a term with fresh variables for all values of N grater or equal to 0. Variables in Term are shared with Copy.

Compilation flags:
```
static
```

Template:
```
varnumbers(Term,Copy)
```
Mode and number of proofs:
```
varnumbers(@term,?term) - zero_or_one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

term

object

1.339.21 type

Type checking predicates. User extensible. New types can be defined by adding clauses for the type/1 and check/2 multifile predicates.

Availability:
```
logtalk_load(types(loader))
```

Author: Paulo Moura
Version: 2:9:2
Date: 2026-10-29

Compilation flags:
```
static, context_switching_calls, complements(restrict)
```

Uses:
list

Remarks:

- Logtalk specific types: `entity`, `object`, `protocol`, `category`, `entity_identifier`, `object_identifier`, `protocol_identifier`, `category_identifier`, `event`, `predicate`.
- Prolog module related types (when the backend compiler supports modules): `module`, `module_identifier`, `qualified_callable`.
- Prolog base types: `term`, `var`, `nonvar`, `atomic`, `atom`, `number`, `integer`, `float`, `compound`, `callable`, `ground`.
- Atom derived types: `non_quoted_atom`, `non_empty_atom`, `boolean`, `character`, `in_character`, `char`, `operator_specifier`, `hex_char`.
- Atom derived parametric types: `atom(CharSet)`, `atom(CharSet,Length)`, `non_empty_atom(CharSet)`, `character(CharSet)`, `in_character(CharSet)`, `char(CharSet)`.
- Number derived types: `positive_number`, `negative_number`, `non_positive_number`, `non_negative_number`.
- Float derived types: `positive_float`, `negative_float`, `non_positive_float`, `non_negative_float`, `probability`, `open_probability`.
- Integer derived types: `positive_integer`, `negative_integer`, `non_positive_integer`, `non_negative_integer`, `byte`, `in_byte`, `character_code`, `in_character_code`, `code`, `operator_priority`, `hex_code`.
- Integer derived parametric types: `character_code(CharSet)`, `in_character_code(CharSet)`, `code(CharSet)`.
- List types (compound derived types): `list`, `non_empty_list`, `partial_list`, `list_or_partial_list`, `list(Type)`, `list(Type,Length)`, `list(Type,Min,Max)`, `list(Type,Length,Min,Max)`, `non_empty_list(Type)`, `codes`, `codes(CharSet)`, `chars`, `chars(CharSet)`.
- Difference list types (compound derived types): `difference_list`, `difference_list(Type)`.
- Other compound derived types: `compound(Name,Types)`, `predicate_indicator`, `non_terminal_indicator`, `predicate_or_non_terminal_indicator`, `clause`, `grammar_rule`, `pair`, `pair(KeyType,ValueType)`, `cyclic`, `acyclic`.
- Stream types: `stream`, `stream_or_alias`, `stream(Property)`, `stream_or_alias(Property)`.
- Other types: `text`, `text(CharSet)`, `Object::Closure`, `between(Type,Lower,Upper)`, `property(Type,LambdaExpression)`, `one_of(Type,Set)`, `var_or(Type)`, `ground(Type)`, `types(Types)`, `constrain(Type,Closure)`, `type`.
- Type `predicate` notes: This type is used to check for an object public predicate specified as `Object::Functor/Arity`.
- Type `boolean` notes: The two value of this type are the atoms `true` and `false`.
- Stream types notes: In the case of the `stream(Property)` and `stream_or_alias(Property)` types, Property must be a valid stream property.
- Type `order` notes: The three possible values of this type are the single character atoms `<`, `=`, and `>`.
- Type `character_code` notes: This type takes into account Unicode support by the backend compiler. When Unicode is supported, it distinguishes between BMP and full support. When Unicode is not supported, it assumes a byte representation for characters.
- Types `text` and `text(CharSet)` notes: These types allow text to be represented using atoms, character lists, or character code lists.
- Type `Object::Closure` notes: Allows calling a public object predicate for type-checking. The predicate should provide `valid/2` predicate semantics and assume called with a bound argument. The `Closure` closure is extended with a single argument, the value to be checked.
- Type `compound(Name,Types)` notes: This type verifies that a compound term have the given `Name` and its arguments conform to `Types`.
- Type `between(Type, Lower, Upper)` notes: The type argument allows distinguishing between numbers and other types. It also allows choosing between mixed integer/float comparisons and strict float or integer comparisons. The term is type-checked before testing for interval membership.
- Type `property(Type, Lambda)` notes: Verifies that `Term` satisfies a property described using a lambda expression of the form `[Parameter]>>Goal`. The lambda expression is applied in the context of `user`. The term is type-checked before calling the goal.
- Type `one_of(Type, Set)` notes: For checking if a given term is an element of a set. The set is represented using a list. The term is type-checked before testing for set membership.

- Type `var_or(Type)` notes: Allows checking if a term is either a variable or a valid value of the given type.
- Type `ground(Type)` notes: Allows checking if a term is ground and a valid value of the given type.
- Type `types(Types)` notes: Allows checking if a term is a valid value for one of the types in a list of types.
- Type `constrain(Type,Closure)` notes: Allows checking if a term is a valid value for the given type and satisfies the given closure.
- Type `type` notes: Allows checking if a term is a valid type.
- Type `qualified_callable` notes: Allows checking if a term is a possibly module-qualified callable term. When the term is qualified, it also checks that the qualification modules are type correct. When the term is not qualified, its semantics are the same as the callable type.
- Design choices: The main predicates are `valid/2` and `check/3`. These are defined using the predicate `check/2`. Defining clauses for `check/2` instead of `valid/2` gives the user full control of exception terms without requiring an additional predicate.
- Error context: The built-in execution-context method `context/1` can be used to provide the calling context for errors when using the predicate `check/3`.
- Registering new types: New types can be registered by defining clauses for the `type/1` and `check/2` multifile predicates. Clauses for both predicates must have a bound first argument to avoid introducing spurious choice-points when type-checking terms.
- Meta-types: Meta-types are types that have one or more sub-type arguments. E.g. `var_or(Type)`. The sub-types of a meta-type can be enumerated by defining a clause for the `meta_type/3` multifile predicate.
- Character sets: When testing character or character code based terms (e.g., atom), it is possible to choose a character set (`ascii_identifier`, `ascii_printable`, `ascii_full`, `hexadecimal`, `byte`, `unicode_bmp`, or `unicode_full`) using the parameterizable types.
- Caveats: The type argument (and any type parameterization) to the predicates is not type-checked (or checked for consistency) for performance reasons.
- Unicode limitations: Currently, correct character/code type-checking is only ensured for SWI-Prolog and XVM as other backends do not provide support for querying a Unicode code point category.
- Random seed: When setting the random generator seed using the `set_seed/1` predicate inherited from the `arbitrary` category, the seed must be a valid value for the portable random generator provided by the `random` library.

Inherited public predicates:

arbitrary/1 arbitrary/2 edge_case/2 get_seed/1 max_size/1 mutation/3 set_seed/1 shrink/3 shrink_sequence/3 shrinker/1

- *Public predicates*
  - *type/1*
  - *meta_type/3*
  - *valid/2*
  - *check/3*
  - *check/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

type/1

Table of defined types. A new type can be registered by defining a clause for this predicate and adding a clause for the check/2 multifile predicate.

Compilation flags:

```
static, multifile
```

Template:

```
type(Type)
```

Mode and number of proofs:

```
type(?callable) - zero_or_more
```

---

meta_type/3

Table of defined meta-types. A registered type that is a meta-type can be described by defining a clause for this predicate to enumerate its sub-types and optional values in case of a single sub-type.

Compilation flags:

```
static, multifile
```

Template:

```
meta_type(MetaType,SubTypes,Values)
```

Mode and number of proofs:

```
meta_type(?callable,-list,-list) - zero_or_more
```

---

valid/2

True if the given term is of the specified type. Fails otherwise.

Compilation flags:

```
static
```

Template:

```
valid(Type,Term)
```

Mode and number of proofs:

```
valid(@callable,@term) - zero_or_one
```

---

check/3

True if the given term is of the specified type. Throws an error otherwise using the format `error(Error, Context)`. For the possible values of `Error` see the `check/2` predicate.

Compilation flags:

`static`

Template:

`check(Type,Term,Context)`

Mode and number of proofs:

`check(@callable,@term,@term)` - `one_or_error`

---

check/2

True if the given term is of the specified type. Throws an error otherwise. A new type can be added by defining a clause for this predicate and registering it by adding a clause for the `type/1` multifile predicate.

Compilation flags:

`static, multifile`

Template:

`check(Type,Term)`

Meta-predicate template:

`check(::,*)`

Mode and number of proofs:

`check(@callable,@term)` - `one_or_error`

Exceptions:

`Term` is not bound as required:

`instantiation_error`

`Term` is bound but not of the specified type:

`type_error(Type,Term)`

`Term` is the of the correct type but not in the specified domain:

`domain_error(Domain,Term)`

`Term` is the of the correct type and domain but the resource it represents does not exist:

`existence_error(Type,Term)`

Public predicates

append/3

Appends two lists.

Compilation flags:

```
static
```

Template:

```
append(List1,List2,List)
```

Mode and number of proofs:

```
append(?list,?list,?list) - zero_or_more
```

delete/3

Deletes from a list all occurrences of an element returning the list of remaining elements.

Compilation flags:
```
static
```

Template:
```
delete(List,Element,Remaining)
```
Mode and number of proofs:
```
delete(@list,@term,?list) - one
```

---

empty/1

True if the argument is an empty list.

Compilation flags:
```
static
```

Template:
```
empty(List)
```
Mode and number of proofs:
```
empty(@list) - zero_or_one
```

---

flatten/2

Flattens a list of lists into a list.

Compilation flags:
```
static
```

Template:
```
flatten(List,Flatted)
```
Mode and number of proofs:
```
flatten(@list,-list) - one
```

---

last/2

List last element (if it exists).

Compilation flags:
`static`

Template:
`last(List,Last)`
Mode and number of proofs:
`last(@list,@var)` - `zero_or_one`

---

length/2

List length.

Compilation flags:
`static`

Template:
`length(List,Length)`
Mode and number of proofs:
`length(@list,?integer)` - `zero_or_one`

---

memberchk/2

Checks if a variable is a member of a list.

Compilation flags:
`static`

Template:
`memberchk(Element,List)`
Mode and number of proofs:
`memberchk(@var,@list)` - `zero_or_one`

---

nextto/3

X and Y are consecutive elements in List.

Compilation flags:

```
static
```

Template:

```
nextto(X,Y,List)
```

Mode and number of proofs:

```
nextto(@var,@var,?list) - zero_or_more
```

---

nth0/3

Nth element of a list (counting from zero).

Compilation flags:

```
static
```

Template:

```
nth0(Nth,List,Element)
```

Mode and number of proofs:

```
nth0(?integer,+list,@var) - zero_or_more
```

---

nth0/4

Nth element of a list (counting from zero). Rest is a list of all the other elements. Can be used to either select the nth element of List or to insert an element before the nth element in Rest.

Compilation flags:

```
static
```

Template:

```
nth0(Nth,List,Element,Rest)
```

Mode and number of proofs:

```
nth0(?integer,+list,@var,?list) - zero_or_more
```

---

nth1/3

Nth element of a list (counting from one).

Compilation flags:
`static`

Template:
`nth1(Nth,List,Element)`
Mode and number of proofs:
`nth1(?integer,+list,@var)` - `zero_or_more`

---

nth1/4

Nth element of a list (counting from zero). `Rest` is a list of all the other elements. Can be used to either select the nth element of `List` or to insert an element before the nth element in `Rest`.

Compilation flags:
`static`

Template:
`nth1(Nth,List,Element,Rest)`
Mode and number of proofs:
`nth1(?integer,+list,@var,?list)` - `zero_or_more`

---

permutation/2

The two lists are a permutation of the same list.

Compilation flags:
`static`

Template:
`permutation(List,Permutation)`
Mode and number of proofs:
`permutation(@list,@list)` - `zero_or_one`

---

prefix/2

`Prefix` is a prefix of `List`.

Compilation flags:
`static`

Template:
`prefix(Prefix,List)`
Mode and number of proofs:
`prefix(?list,@list)` - `zero_or_more`

---

remove_duplicates/2

Removes duplicated variables and keeping the left-most variable when repeated.

Compilation flags:
`static`

Template:
`remove_duplicates(List,Set)`
Mode and number of proofs:
`remove_duplicates(+list,-list)` - `one`

---

reverse/2

Reverses a list.

Compilation flags:
`static`

Template:
`reverse(List,Reversed)`
Mode and number of proofs:
`reverse(@list,?list)` - `zero_or_one`
`reverse(?list,@list)` - `zero_or_one`
`reverse(-list,-list)` - `one_or_more`

---

same_length/2

The two lists have the same length.

Compilation flags:
```
static
```

Template:
```
same_length(List1,List2)
```
Mode and number of proofs:
```
same_length(@list,?list) - zero_or_one
same_length(?list,@list) - zero_or_one
same_length(-list,-list) - one_or_more
```

---

select/3

Selects an element from a list, returning the list of remaining elements.

Compilation flags:
```
static
```

Template:
```
select(Element,List,Remaining)
```
Mode and number of proofs:
```
select(@var,?list,?list) - zero_or_more
```

---

sublist/2

The first list is a sublist of the second.

Compilation flags:
```
static
```

Template:
```
sublist(Sublist,List)
```
Mode and number of proofs:
```
sublist(?list,@list) - zero_or_more
```

---

subtract/3

Removes all elements in the second list from the first list, returning the list of remaining elements.

Compilation flags:
`static`

Template:
`subtract(List,Elements,Remaining)`
Mode and number of proofs:
`subtract(@list,@list,-list)` - `one`

---

suffix/2

`Suffix` is a suffix of `List`.

Compilation flags:
`static`

Template:
`suffix(Suffix,List)`
Mode and number of proofs:
`suffix(?list,@list)` - `zero_or_more`

---

valid/1

Term is a valid list of variables.

Compilation flags:
`static`

Template:
`valid(Term)`
Mode and number of proofs:
`valid(@nonvar)` - `zero_or_one`

`check/1`

Checks if a term is a valid list of variables. Throws an exception if the term is not valid.

Compilation flags:
`static`

Template:
`check(Term)`
Mode and number of proofs:
`check(@nonvar)` - `one`

Public predicates

load/1

Loads a TZif source given as `file(Path, ZoneId)`, `files(Root, Paths)`, `directory(Root)`, `stream(Stream, ZoneId)`, `bytes(Bytes, ZoneId)`, or `snapshot(File)` and caches the resulting per-zone `tzif(...)` terms, replacing cached entries with matching zone identifiers. For `directory(Root)` sources, regular files whose relative paths are not recognized zone identifiers are ignored, allowing system zoneinfo trees that contain metadata files such as `leapseconds`. Zone identifiers are validated against bundled IANA TZDB 2026a canonical names plus backward-compatible aliases.

Compilation flags:

`static`

Template:

`load(Source)`

Mode and number of proofs:

`load(+compound)` - `zero_or_one`

---

load/2

Loads a TZif source given as `file(Path, ZoneId)`, `files(Root, Paths)`, `directory(Root)`, `stream(Stream, ZoneId)`, `bytes(Bytes, ZoneId)`, or `snapshot(File)` into a list of per-zone `tzif(...)` compound terms without caching them. For `directory(Root)` sources, regular files whose relative paths are not recognized zone identifiers are ignored, allowing system zoneinfo trees that contain metadata files such as `leapseconds`. Zone identifiers are validated against bundled IANA TZDB 2026a canonical names plus backward-compatible aliases.

Compilation flags:

`static`

Template:

`load(Source,TZifs)`

Mode and number of proofs:

`load(+compound,-list(compound))` - `zero_or_one`

---

cache/1

Caches one or more loaded per-zone `tzif(...)` compound terms, replacing cached entries with matching zone identifiers.

Compilation flags:
`static`

Template:
`cache(TZifs)`
Mode and number of proofs:
`cache(+list(compound))` - `one`

---

save/2

Saves a list of per-zone `tzif(...)` terms to a plain Prolog snapshot file, writing one serialized term per line.

Compilation flags:
`static`

Template:
`save(TZifs,File)`
Mode and number of proofs:
`save(+list(compound),+atom)` - `one`

---

save/1

Saves all cached `tzif(...)` terms to a plain Prolog snapshot file.

Compilation flags:
`static`

Template:
`save(File)`
Mode and number of proofs:
`save(+atom)` - `one_or_error`

Exceptions:
No TZif terms are cached:
`existence_error(tzif_cache,tzif)`
`File` is a variable:
`instantiation_error`
`File` is neither a variable nor a valid file name atom:
`domain_error(file_name,File)`

---

clear_cache/0

Clears all cached TZif terms.

Compilation flags:
`static`

Mode and number of proofs:
`clear_cache` - `one`

---

cache_source/1

Enumerates the source terms recorded in the cached TZif terms.

Compilation flags:
`static`

Template:
`cache_source(Source)`
Mode and number of proofs:
`cache_source(-compound)` - `zero_or_more`

---

cached_tzif/1

Enumerates the cached per-zone `tzif(...)` terms.

Compilation flags:
`static`

Template:
`cached_tzif(TZif)`
Mode and number of proofs:
`cached_tzif(-compound)` - `zero_or_more`

---

zone/3

Returns the loaded zone identifier and its nested parsed zone-data term from a per-zone `tzif(...)` term.

Compilation flags:
`static`

Template:

```
zone(TZif,Zone,ZoneData)
```

Mode and number of proofs:

```
zone(+compound,?atom,-compound) - zero_or_one
```

---

zones/2

Returns the list of zone identifiers loaded in a list of per-zone `tzif(...)` terms.

Compilation flags:

```
static
```

Template:

```
zones(TZifs,Zones)
```

Mode and number of proofs:

```
zones(+list(compound),-list(atom)) - one
```

---

zones/1

Returns the list of zone identifiers loaded in the cached `tzif(...)` terms.

Compilation flags:

```
static
```

Template:

```
zones(Zones)
```

Mode and number of proofs:

```
zones(-list(atom)) - one_or_error
```

Exceptions:

No TZif terms are cached:

```
existence_error(tzif_cache,tzif)
```

---

time_type/4

Returns the applicable local time type for a loaded zone and a UTC instant given either as Unix seconds or as a `date_time/6` term.

Compilation flags:

```
static
```

Template:

```
time_type(TZif,Zone,UTC,TimeType)
```

Mode and number of proofs:
`time_type(+compound,+atom,+types([integer,compound]),-compound)` - `zero_or_one`

---

time_type/3

Returns the applicable local time type for a zone in the cached TZif terms.

Compilation flags:
`static`

Template:
`time_type(Zone,UTC,TimeType)`
Mode and number of proofs:
`time_type(+atom,+types([integer,compound]),-compound)` - `one_or_error`

Exceptions:
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

time_type/2

Cached single-zone convenience variant of `time_type/3` using the cached TZif terms; requires exactly one cached zone.

Compilation flags:
`static`

Template:
`time_type(UTC,TimeType)`
Mode and number of proofs:
`time_type(+types([integer,compound]),-compound)` - `one_or_error`

Exceptions:
No TZif terms are cached:
`existence_error(tzif_cache,tzif)`
The cached TZif terms do not contain exactly one zone:
`domain_error(single_zone_tzif_cache,TZifs)`

---

offset/4

Returns the UTC offset in seconds for a loaded zone and a UTC instant.

Compilation flags:
`static`

Template:
`offset(TZif,Zone,UTC,OffsetSeconds)`
Mode and number of proofs:
`offset(+compound,+atom,+types([integer,compound]),-integer)` - `zero_or_one`

---

offset/3

Returns the UTC offset in seconds for a zone in the cached TZif terms.

Compilation flags:
`static`

Template:
`offset(Zone,UTC,OffsetSeconds)`
Mode and number of proofs:
`offset(+atom,+types([integer,compound]),-integer)` - `one_or_error`

Exceptions:
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

offset/2

Cached single-zone convenience variant of `offset/3` using the cached TZif terms; requires exactly one cached zone.

Compilation flags:
`static`

Template:
`offset(UTC,OffsetSeconds)`
Mode and number of proofs:
`offset(+types([integer,compound]),-integer)` - `one_or_error`

Exceptions:
The cached TZif terms do not contain exactly one zone:
`domain_error(single_zone_tzif_cache,TZifs)`

---

daylight_saving_time/4

Returns `true` or `false` according to whether daylight saving time is active for a loaded zone and a UTC instant.

Compilation flags:
`static`

Template:
`daylight_saving_time(TZif,Zone,UTC,IsDST)`
Mode and number of proofs:
`daylight_saving_time(+compound,+atom,+types([integer,compound]),-atom)` - `zero_or_one`

---

daylight_saving_time/3

Returns daylight-saving information for a zone in the cached TZif terms.

Compilation flags:
`static`

Template:
`daylight_saving_time(Zone,UTC,IsDST)`
Mode and number of proofs:
`daylight_saving_time(+atom,+types([integer,compound]),-atom)` - `one_or_error`

Exceptions:
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

daylight_saving_time/2

Cached single-zone convenience variant of `daylight_saving_time/3` using the cached TZif terms; requires exactly one cached zone.

Compilation flags:
`static`

Template:
`daylight_saving_time(UTC,IsDST)`
Mode and number of proofs:
`daylight_saving_time(+types([integer,compound]),-atom)` - `one_or_error`

Exceptions:
The cached TZif terms do not contain exactly one zone:
`domain_error(single_zone_tzif_cache,TZifs)`

---

abbreviation/4

Returns the time-zone abbreviation for a loaded zone and a UTC instant.

Compilation flags:
`static`

Template:
`abbreviation(TZif,Zone,UTC,Abbreviation)`
Mode and number of proofs:
`abbreviation(+compound,+atom,+types([integer,compound]),-atom)` - `zero_or_one`

---

abbreviation/3

Returns the time-zone abbreviation for a zone in the cached TZif terms.

Compilation flags:
`static`

Template:
`abbreviation(Zone,UTC,Abbreviation)`
Mode and number of proofs:
`abbreviation(+atom,+types([integer,compound]),-atom)` - `one_or_error`

Exceptions:
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

abbreviation/2

Cached single-zone convenience variant of `abbreviation/3` using the cached TZif terms; requires exactly one cached zone.

Compilation flags:
`static`

Template:
`abbreviation(UTC,Abbreviation)`
Mode and number of proofs:
`abbreviation(+types([integer,compound]),-atom)` - `one_or_error`

Exceptions:
The cached TZif terms do not contain exactly one zone:
`domain_error(single_zone_tzif_cache,TZifs)`

---

local_time_type/4

Returns the applicable local time type for a loaded zone and a local civil time given as a `date_time/6` term. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:
`static`

Template:
`local_time_type(TZif,Zone,LocalDateTime,TimeType)`
Mode and number of proofs:
`local_time_type(+compound,+atom,+compound,-compound)` - `zero_or_one`

---

local_time_type/3

Returns the applicable local time type for a zone in the cached TZif terms. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:
`static`

Template:
`local_time_type(Zone,LocalDateTime,TimeType)`
Mode and number of proofs:
`local_time_type(+atom,+compound,-compound)` - `one_or_error`

Exceptions:
`LocalDateTime` is a variable:
`instantiation_error`
`LocalDateTime` is neither a variable nor a valid `date_time/6` term:
`type_error(date_time,LocalDateTime)`
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

local_time_type/2

Cached single-zone convenience variant of strict local civil-time lookup; requires exactly one cached zone and fails unless the local civil time has a unique interpretation.

Compilation flags:
`static`

Template:
`local_time_type(LocalDateTime,TimeType)`
Mode and number of proofs:

`local_time_type(+compound,-compound)` - `one_or_error`

Exceptions:

`LocalDateTime` is a variable:

`instantiation_error`

`LocalDateTime` is neither a variable nor a valid `date_time/6` term:

`type_error(date_time,LocalDateTime)`

No TZif terms are cached:

`existence_error(tzif_cache,tzif)`

The cached TZif terms do not contain exactly one zone:

`domain_error(single_zone_tzif_cache,TZifs)`

`local_time_type_with_resolution/5`

Returns the applicable local time type for a loaded zone and a local civil time using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:

`static`

Template:

`local_time_type_with_resolution(TZif,Zone,LocalDateTime,ResolutionMode,TimeType)`

Mode and number of proofs:

`local_time_type_with_resolution(+compound,+atom,+compound,+atom,-compound)` - `zero_or_more`

`local_time_type_with_resolution/4`

Returns the applicable local time type for a zone in the cached TZif terms using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:

`static`

Template:

`local_time_type_with_resolution(Zone,LocalDateTime,ResolutionMode,TimeType)`

Mode and number of proofs:

`local_time_type_with_resolution(+atom,+compound,+atom,-compound)` - `zero_or_more`

---

local_time_type_with_resolution/3

Cached single-zone convenience variant of local civil-time lookup using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order). Requires exactly one cached zone.

Compilation flags:

`static`

Template:

`local_time_type_with_resolution(LocalDateTime,ResolutionMode,TimeType)`

Mode and number of proofs:

`local_time_type_with_resolution(+compound,+atom,-compound)` - `zero_or_more`

---

local_offset/4

Returns the UTC offset in seconds for a loaded zone and a local civil time. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:

`static`

Template:

`local_offset(TZif,Zone,LocalDateTime,OffsetSeconds)`

Mode and number of proofs:

`local_offset(+compound,+atom,+compound,-integer)` - `zero_or_one`

---

local_offset/3

Returns the UTC offset in seconds for a zone in the cached TZif terms. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:

`static`

Template:

`local_offset(Zone,LocalDateTime,OffsetSeconds)`

Mode and number of proofs:

`local_offset(+atom,+compound,-integer)` - `one_or_error`

Exceptions:

`Zone` is not present in the cached TZif terms:

`existence_error(time_zone,Zone)`

---

local_offset/2

Cached single-zone convenience variant of strict local civil-time offset lookup.

Compilation flags:

```
static
```

Template:

```
local_offset(LocalDateTime,OffsetSeconds)
```

Mode and number of proofs:

```
local_offset(+compound,-integer) - one_or_error
```

Exceptions:

The cached TZif terms do not contain exactly one zone:

```
domain_error(single_zone_tzif_cache,TZifs)
```

---

local_offset_with_resolution/5

Returns the UTC offset in seconds for a loaded zone and a local civil time using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:

```
static
```

Template:

```
local_offset_with_resolution(TZif,Zone,LocalDateTime,ResolutionMode,
OffsetSeconds)
```

Mode and number of proofs:

```
local_offset_with_resolution(+compound,+atom,+compound,+atom,-integer) -
zero_or_more
```

---

local_offset_with_resolution/4

Returns the UTC offset in seconds for a zone in the cached TZif terms using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:

```
static
```

Template:

```
local_offset_with_resolution(Zone,LocalDateTime,ResolutionMode,OffsetSeconds)
```

Mode and number of proofs:

```
local_offset_with_resolution(+atom,+compound,+atom,-integer) - zero_or_more
```

---

local_offset_with_resolution/3

Cached single-zone convenience variant of local civil-time offset lookup using the explicit resolution mode; requires exactly one cached zone.

Compilation flags:
`static`

Template:
`local_offset_with_resolution(LocalDateTime,ResolutionMode,OffsetSeconds)`
Mode and number of proofs:
`local_offset_with_resolution(+compound,+atom,-integer)` - `zero_or_more`

---

local_daylight_saving_time/4

Returns daylight-saving information for a loaded zone and a local civil time. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:
`static`

Template:
`local_daylight_saving_time(TZif,Zone,LocalDateTime,IsDST)`
Mode and number of proofs:
`local_daylight_saving_time(+compound,+atom,+compound,-atom)` - `zero_or_one`

---

local_daylight_saving_time/3

Returns daylight-saving information for a zone in the cached TZif terms. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:
`static`

Template:
`local_daylight_saving_time(Zone,LocalDateTime,IsDST)`
Mode and number of proofs:
`local_daylight_saving_time(+atom,+compound,-atom)` - `one_or_error`

Exceptions:
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

local_daylight_saving_time/2

Cached single-zone convenience variant of strict local daylight-saving lookup.

Compilation flags:

```
static
```

Template:

```
local_daylight_saving_time(LocalDateTime,IsDST)
```

Mode and number of proofs:

```
local_daylight_saving_time(+compound,-atom) - one_or_error
```

Exceptions:

The cached TZif terms do not contain exactly one zone:

```
domain_error(single_zone_tzif_cache,TZifs)
```

---

local_daylight_saving_time_with_resolution/5

Returns daylight-saving information for a loaded zone and a local civil time using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:

```
static
```

Template:

```
local_daylight_saving_time_with_resolution(TZif,Zone,LocalDateTime,
ResolutionMode,IsDST)
```

Mode and number of proofs:

```
local_daylight_saving_time_with_resolution(+compound,+atom,+compound,+atom,-atom)
- zero_or_more
```

---

local_daylight_saving_time_with_resolution/4

Returns daylight-saving information for a zone in the cached TZif terms using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:

```
static
```

Template:

```
local_daylight_saving_time_with_resolution(Zone,LocalDateTime,ResolutionMode,
IsDST)
```

Mode and number of proofs:

```
local_daylight_saving_time_with_resolution(+atom,+compound,+atom,-atom) -
zero_or_more
```

---

local_daylight_saving_time_with_resolution/3

Cached single-zone convenience variant of local civil-time daylight-saving lookup using the explicit resolution mode; requires exactly one cached zone.

Compilation flags:

```
static
```

Template:

```
local_daylight_saving_time_with_resolution(LocalDateTime,ResolutionMode,IsDST)
```

Mode and number of proofs:

```
local_daylight_saving_time_with_resolution(+compound,+atom,-atom) - zero_or_more
```

---

local_abbreviation/4

Returns the time-zone abbreviation for a loaded zone and a local civil time. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:

```
static
```

Template:

```
local_abbreviation(TZif,Zone,LocalDateTime,Abbreviation)
```

Mode and number of proofs:

```
local_abbreviation(+compound,+atom,+compound,-atom) - zero_or_one
```

---

local_abbreviation/3

Returns the time-zone abbreviation for a zone in the cached TZif terms. This strict variant fails unless the local civil time has a unique interpretation.

Compilation flags:

```
static
```

Template:

```
local_abbreviation(Zone,LocalDateTime,Abbreviation)
```

Mode and number of proofs:

```
local_abbreviation(+atom,+compound,-atom) - one_or_error
```

Exceptions:

`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

local_abbreviation/2

Cached single-zone convenience variant of strict local abbreviation lookup.

Compilation flags:
`static`

Template:
`local_abbreviation(LocalDateTime,Abbreviation)`
Mode and number of proofs:
`local_abbreviation(+compound,-atom)` - `one_or_error`

Exceptions:
The cached TZif terms do not contain exactly one zone:
`domain_error(single_zone_tzif_cache,TZifs)`

---

local_abbreviation_with_resolution/5

Returns the time-zone abbreviation for a loaded zone and a local civil time using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:
`static`

Template:
`local_abbreviation_with_resolution(TZif,Zone,LocalDateTime,ResolutionMode,Abbreviation)`
Mode and number of proofs:
`local_abbreviation_with_resolution(+compound,+atom,+compound,+atom,-atom)` - `zero_or_more`

---

local_abbreviation_with_resolution/4

Returns the time-zone abbreviation for a zone in the cached TZif terms using the explicit resolution mode: `strict` (fail unless exactly one interpretation exists), `first` (prefer the earliest valid interpretation), `second` (prefer the latest valid interpretation), and `all` (enumerate all valid interpretations in chronological order).

Compilation flags:
`static`

Template:
`local_abbreviation_with_resolution(Zone,LocalDateTime,ResolutionMode,Abbreviation)`
Mode and number of proofs:
`local_abbreviation_with_resolution(+atom,+compound,+atom,-atom)` - `zero_or_more`

---

local_abbreviation_with_resolution/3

Cached single-zone convenience variant of local civil-time abbreviation lookup using the explicit resolution mode; requires exactly one cached zone.

Compilation flags:
`static`

Template:
`local_abbreviation_with_resolution(LocalDateTime,ResolutionMode,Abbreviation)`
Mode and number of proofs:
`local_abbreviation_with_resolution(+compound,+atom,-atom)` - `zero_or_more`

---

local_time_type_reified/4

Returns a reified local civil-time lookup result for a loaded zone as one of `unique(TimeType)`, `ambiguous(TimeTypes)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_time_type_reified(TZif,Zone,LocalDateTime,Result)`
Mode and number of proofs:
`local_time_type_reified(+compound,+atom,+compound,-compound)` - `one`

---

local_time_type_reified/3

Returns a reified local civil-time lookup result for a zone in the cached TZif terms as one of `unique(TimeType)`, `ambiguous(TimeTypes)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_time_type_reified(Zone,LocalDateTime,Result)`
Mode and number of proofs:

`local_time_type_reified(+atom,+compound,-compound)` - `one_or_error`

Exceptions:

`LocalDateTime` is a variable:

`instantiation_error`

`LocalDateTime` is neither a variable nor a valid `date_time/6` term:

`type_error(date_time,LocalDateTime)`

`Zone` is not present in the cached TZif terms:

`existence_error(time_zone,Zone)`

`local_time_type_reified/2`

Cached single-zone convenience variant of reified local civil-time lookup; returns `unique(TimeType)`, `ambiguous(TimeTypes)`, or `nonexistent`.

Compilation flags:

`static`

Template:

`local_time_type_reified(LocalDateTime,Result)`

Mode and number of proofs:

`local_time_type_reified(+compound,-compound)` - `one_or_error`

Exceptions:

`LocalDateTime` is a variable:

`instantiation_error`

`LocalDateTime` is neither a variable nor a valid `date_time/6` term:

`type_error(date_time,LocalDateTime)`

No TZif terms are cached:

`existence_error(tzif_cache,tzif)`

The cached TZif terms do not contain exactly one zone:

`domain_error(single_zone_tzif_cache,TZifs)`

`local_offset_reified/4`

Returns a reified local offset lookup result for a loaded zone as one of `unique(OffsetSeconds)`, `ambiguous(OffsetSecondsList)`, or `nonexistent`.

Compilation flags:

`static`

Template:

`local_offset_reified(TZif,Zone,LocalDateTime,Result)`

Mode and number of proofs:

`local_offset_reified(+compound,+atom,+compound,-compound)` - `one`

---

local_offset_reified/3

Returns a reified local offset lookup result for a zone in the cached TZif terms as one of `unique(OffsetSeconds)`, `ambiguous(OffsetSecondsList)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_offset_reified(Zone,LocalDateTime,Result)`
Mode and number of proofs:
`local_offset_reified(+atom,+compound,-compound)` - `one_or_error`

Exceptions:
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

local_offset_reified/2

Cached single-zone convenience variant of reified local offset lookup; returns `unique(OffsetSeconds)`, `ambiguous(OffsetSecondsList)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_offset_reified(LocalDateTime,Result)`
Mode and number of proofs:
`local_offset_reified(+compound,-compound)` - `one_or_error`

Exceptions:
The cached TZif terms do not contain exactly one zone:
`domain_error(single_zone_tzif_cache,TZifs)`

---

local_daylight_saving_time_reified/4

Returns a reified local daylight-saving lookup result for a loaded zone as one of `unique(IsDST)`, `ambiguous(IsDSTList)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_daylight_saving_time_reified(TZif,Zone,LocalDateTime,Result)`
Mode and number of proofs:

`local_daylight_saving_time_reified(+compound,+atom,+compound,-compound)` - `one`

`local_daylight_saving_time_reified/3`

Returns a reified local daylight-saving lookup result for a zone in the cached TZif terms as one of `unique(IsDST)`, `ambiguous(IsDSTList)`, or `nonexistent`.

Compilation flags:

`static`

Template:

`local_daylight_saving_time_reified(Zone,LocalDateTime,Result)`

Mode and number of proofs:

`local_daylight_saving_time_reified(+atom,+compound,-compound)` - `one_or_error`

Exceptions:

`Zone` is not present in the cached TZif terms:

`existence_error(time_zone,Zone)`

`local_daylight_saving_time_reified/2`

Cached single-zone convenience variant of reified local daylight-saving lookup; returns `unique(IsDST)`, `ambiguous(IsDSTList)`, or `nonexistent`.

Compilation flags:

`static`

Template:

`local_daylight_saving_time_reified(LocalDateTime,Result)`

Mode and number of proofs:

`local_daylight_saving_time_reified(+compound,-compound)` - `one_or_error`

Exceptions:

The cached TZif terms do not contain exactly one zone:

`domain_error(single_zone_tzif_cache,TZifs)`

---

local_abbreviation_reified/4

Returns a reified local abbreviation lookup result for a loaded zone as one of `unique(Abbreviation)`, `ambiguous(Abbreviations)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_abbreviation_reified(TZif,Zone,LocalDateTime,Result)`
Mode and number of proofs:
`local_abbreviation_reified(+compound,+atom,+compound,-compound)` - `one`

---

local_abbreviation_reified/3

Returns a reified local abbreviation lookup result for a zone in the cached TZif terms as one of `unique(Abbreviation)`, `ambiguous(Abbreviations)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_abbreviation_reified(Zone,LocalDateTime,Result)`
Mode and number of proofs:
`local_abbreviation_reified(+atom,+compound,-compound)` - `one_or_error`

Exceptions:
`Zone` is not present in the cached TZif terms:
`existence_error(time_zone,Zone)`

---

local_abbreviation_reified/2

Cached single-zone convenience variant of reified local abbreviation lookup; returns `unique(Abbreviation)`, `ambiguous(Abbreviations)`, or `nonexistent`.

Compilation flags:
`static`

Template:
`local_abbreviation_reified(LocalDateTime,Result)`
Mode and number of proofs:
`local_abbreviation_reified(+compound,-compound)` - `one_or_error`

Exceptions:
The cached TZif terms do not contain exactly one zone:

```
domain_error(single_zone_tzif_cache,TZifs)
```

Public predicates

tzdb_version/1

Bundled IANA TZDB release used to derive the zone-id table.

Compilation flags:
`static`

Template:
`tzdb_version(Version)`
Mode and number of proofs:
`tzdb_version(-atom)` - `one`

---

known_zone_id/1

True when the argument is a bundled canonical TZDB zone id or backward-compatible alias.

Compilation flags:
`static`

Template:
`known_zone_id(ZoneId)`
Mode and number of proofs:
`known_zone_id(+atom)` - `zero_or_one`

---

zone_id_kind/2

Classifies a bundled zone id as canonical or as a backward-compatible alias targeting another zone id.

Compilation flags:
`static`

Template:
`zone_id_kind(ZoneId,Kind)`
Mode and number of proofs:
`zone_id_kind(+atom,-compound)` - `zero_or_one`

Public predicates

generate/1

Generates a new ULID.

Compilation flags:
`static`

Template:
`generate(ULID)`
Mode and number of proofs:
`generate(--ulid)` - `one_or_error`

Exceptions:
The representation parameter is a variable:
`instantiation_error`
The representation parameter is not a variable but also neither `atom`, `chars`, nor `codes`:
`domain_error(ulid_representation,Representation)`

---

generate/2

Generates a new ULID from a timestamp (number of milliseconds since the Unix epoch: 00:00:00 UTC on January 1, 1970).

Compilation flags:
`static`

Template:
`generate(Milliseconds,ULID)`
Mode and number of proofs:
`generate(+integer,--ulid)` - `one_or_error`

Exceptions:

The representation parameter is a variable:

```
instantiation_error
```

The representation parameter is not a variable but also neither `atom`, `chars`, nor `codes`:

```
domain_error(ulid_representation,Representation)
```

`Milliseconds` is a variable:

```
instantiation_error
```

`Milliseconds` is neither a variable nor an integer:

```
type_error(integer,Milliseconds)
```

`Milliseconds` is outside the 48-bit range required by the ULID specification:

```
domain_error(ulid_timestamp,Milliseconds)
```

---

generate/8

Generates a new ULID from a timestamp discrete components.

Compilation flags:

```
static
```

Template:

```
generate(Year,Month,Day,Hours,Minutes,Seconds,Milliseconds,ULID)
```

Mode and number of proofs:

```
generate(+integer,+integer,+integer,+integer,+integer,+integer,+integer,--ulid) -
one_or_error
```

Exceptions:

The representation parameter is a variable:

```
instantiation_error
```

The representation parameter is not a variable but also neither `atom`, `chars`, nor `codes`:

```
domain_error(ulid_representation,Representation)
```

`Milliseconds` is a variable:

```
instantiation_error
```

`Milliseconds` is neither a variable nor an integer:

```
type_error(integer,Milliseconds)
```

`Milliseconds` is an integer but outside the 0..999 range:

```
domain_error(ulid_millisecond,Milliseconds)
```

The timestamp is outside the 48-bit range required by the ULID specification:

```
domain_error(ulid_timestamp,Timestamp)
```

---

timestamp/2

Returns the given ULID timestamp (number of milliseconds since the Unix epoch: 00:00:00 UTC on January 1, 1970).

Compilation flags:
`static`

Template:
`timestamp(ULID,Milliseconds)`
Mode and number of proofs:
`timestamp(++ulid,-integer)` - `one_or_error`

Exceptions:
The representation parameter is a variable:
`instantiation_error`
The representation parameter is not a variable but also neither `atom`, `chars`, nor `codes`:
`domain_error(ulid_representation,Representation)`
`ULID` is a variable:
`instantiation_error`
`ULID` is neither a variable nor an atom when using the `atom` representation:
`type_error(atom,ULID)`
`ULID` is neither a variable nor a list of characters when using the `chars` representation:
`type_error(chars,ULID)`
`ULID` is neither a variable nor a list of character codes when using the `codes` representation:
`type_error(codes,ULID)`
`ULID` is not a valid ULID:
`domain_error(ulid,ULID)`

---

timestamp/8

Decodes a ULID into its timestamp discrete components.

Compilation flags:
`static`

Template:
`timestamp(ULID,Year,Month,Day,Hours,Minutes,Seconds,Milliseconds)`
Mode and number of proofs:
`timestamp(++ulid,-integer,-integer,-integer,-integer,-integer,-integer,-integer)` - `one_or_error`

Exceptions:
The representation parameter is a variable:
`instantiation_error`
The representation parameter is not a variable but also neither `atom`, `chars`, nor `codes`:
`domain_error(ulid_representation,Representation)`
`ULID` is a variable:

`instantiation_error`

`ULID` is neither a variable nor an atom when using the `atom` representation:

`type_error(atom,ULID)`

`ULID` is neither a variable nor a list of characters when using the `chars` representation:

`type_error(chars,ULID)`

`ULID` is neither a variable nor a list of character codes when using the `codes` representation:

`type_error(codes,ULID)`

`ULID` is not a valid ULID:

`domain_error(ulid,ULID)`

category

1.341.4 `ulid_types`

ULID type definition.

Availability:

`logtalk_load(ulid(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2023-05-19

Compilation flags:

`static`

Provides:

type::type/1

type::check/2

Uses:

list

type

Remarks:

- Provided types: This category adds a `ulid(Representation)` type for type-checking when using the `ulid` library object. Valid representation values are `atom`, `chars`, and `codes`.

Private predicates

`graph_connected/2`

Checks fuzzy graph connectivity. Intended for use in testing.

Compilation flags:

`static`

Template:

`graph_connected(FuzzyGraph,SampleCount)`

Mode and number of proofs:

```
graph_connected(+list,+positive_integer) - zero_or_one
```

---

normalized_adjacency/5

Computes the normalized adjacency matrix for a starting vertex of zero and positive vertex degrees. Intended for use in testing.

Compilation flags:
```
static
```

Template:
```
normalized_adjacency(StartVertex,SampleCount,FuzzyGraph,Degrees,Matrix)
```
Mode and number of proofs:
```
normalized_adjacency(+integer,+positive_integer,+list,+list,-list) - zero_or_one
```

Operators

  - *union/4*
  - *union_all/3*
  - *find/4*
  - *find/5*
  - *disjoint_sets/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

new/2

Creates a new union-find data structure with a list of elements as keys.

Compilation flags:
`static`

Template:
`new(Elements,UnionFind)`
Mode and number of proofs:
`new(+list(element),?union_find)` - `zero_or_one`

---

make_set/3

Makes a new set by creating a new element with a unique key `Element`, a rank of `0`, and a parent pointer to itself. The parent pointer to itself indicates that the element is the representative member of its own set.

Compilation flags:
`static`

Template:
`make_set(UnionFind,Element,NewUnionFind)`
Mode and number of proofs:
`make_set(+union_find,+element,?union_find)` - `zero_or_one`

---

union/4

Merges the two trees, if distinct, that contain the given elements. The trees are joined by attaching the shorter tree (by rank) to the root of the taller tree. Fails if any of the elements is not found.

Compilation flags:

```
static
```

Template:

```
union(UnionFind,Element1,Element2,NewUnionFind)
```

Mode and number of proofs:

```
union(+union_find,+element,+element,?union_find) - zero_or_one
```

---

union_all/3

Merges the distinct trees for all the given elements returning the resulting union-find data structure. Fails if any of the elements is not found.

Compilation flags:

```
static
```

Template:

```
union_all(UnionFind,Elements,NewUnionFind)
```

Mode and number of proofs:

```
union_all(+union_find,+list(element),?union_find) - zero_or_one
```

---

find/4

Finds the root element of a set by following the chain of parent pointers from the given element. Root is the representative member of the set to which the element belongs, and may be element itself. Fails if the element is not found.

Compilation flags:

```
static
```

Template:

```
find(UnionFind,Element,Root,NewUnionFind)
```

Mode and number of proofs:

```
find(+union_find,+element,?element,?union_find) - zero_or_one
```

Remarks:

- Path compression: The structure of the tree containing the element is flattened by making every node point to the root whenever this predicate is used on it.

---

find/5

Same as the `find/4` predicate, but returning also the rank of the root. Fails if the element is not found.

Compilation flags:
`static`

Template:
`find(UnionFind,Element,Root,Rank,UnionFindOut)`
Mode and number of proofs:
`find(+union_find,+element,?element,?rank,?union_find)` - `zero_or_one`

Remarks:

- Path compression: The structure of the tree containing the element is flattened by making every node point to the root whenever this predicate is used on it.

---

disjoint_sets/2

Returns the list of disjoint sets in the given union-find data structure.

Compilation flags:
`static`

Template:
`disjoint_sets(UnionFind,Sets)`
Mode and number of proofs:
`disjoint_sets(+union_find,?sets)` - `zero_or_one`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)

1.344 univariate_distributions

object

1.344.1 `univariate_distributions(Random)`

- `Random` - An object implementing the `sampling_protocol` protocol.

Univariate probability distributions using an injected random source.

Availability:
`logtalk_load(univariate_distributions(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-08-12

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *univariate_distributions_protocol*
Uses:
type

Remarks:

- Normal cumulative distribution: Uses the Abramowitz and Stegun formula 26.2.17 approximation.
- Normal quantile: Uses the Peter J. Acklam rational approximation.

Inherited public predicates:
beta/3 beta_density/4 beta_distribution/4 beta_log_density/4 beta_quantile/4 beta_samples/4 chi_squared/2 chi_squared_density/3 chi_squared_distribution/3 chi_squared_log_density/3 chi_squared_quantile/3 chi_squared_samples/3 exponential/2 exponential_density/3 exponential_distribution/3 exponential_log_density/3 exponential_quantile/3 exponential_samples/3 fisher/3 fisher_density/4 fisher_distribution/4 fisher_log_density/4 fisher_quantile/4 fisher_samples/4 gamma/3 gamma_density/4 gamma_distribution/4 gamma_log_density/4 gamma_quantile/4 gamma_samples/4 normal/3 normal_density/4 normal_distribution/4 normal_log_density/4 normal_quantile/4 normal_samples/4 standard_normal/1 standard_normal_density/2 standard_normal_distribution/2 standard_normal_log_density/2 standard_normal_quantile/2 standard_normal_samples/2 standard_t/2 standard_t_density/3 standard_t_distribution/3 standard_t_log_density/3 standard_t_quantile/3 standard_t_samples/3 t/4 t_density/5 t_distribution/5 t_log_density/5 t_quantile/5 t_samples/5

Public predicates

standard_normal/1

Returns a standard normally distributed random value.

Compilation flags:
`static`

Template:
`standard_normal(Value)`
Mode and number of proofs:
`standard_normal(-float)` - `one`

---

standard_normal_samples/2

Returns the requested number of standard normally distributed random values.

Compilation flags:
`static`

Template:
`standard_normal_samples(Count,Samples)`
Mode and number of proofs:
`standard_normal_samples(+integer,-list(float))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`

---

normal/3

Returns a normally distributed random value with the given mean and standard deviation. A zero deviation returns the mean.

Compilation flags:

```
static
```

Template:

```
normal(Mean,Deviation,Value)
```

Mode and number of proofs:

```
normal(+float,+non_negative_float,-float) - one_or_error
```

Exceptions:

`Mean` is a variable:

```
instantiation_error
```

`Mean` is neither a variable nor a float:

```
type_error(float,Mean)
```

`Deviation` is a variable:

```
instantiation_error
```

`Deviation` is neither a variable nor a float:

```
type_error(float,Deviation)
```

`Deviation` is a negative float:

```
domain_error(non_negative_float,Deviation)
```

---

normal_samples/4

Returns the requested number of normally distributed random values with the given mean and standard deviation.

Compilation flags:

```
static
```

Template:

```
normal_samples(Count,Mean,Deviation,Samples)
```

Mode and number of proofs:

```
normal_samples(+integer,+float,+non_negative_float,-list(float)) - one_or_error
```

Exceptions:

`Count` is a variable:

```
instantiation_error
```

`Count` is neither a variable nor an integer:

```
type_error(integer,Count)
```

`Count` is an integer but not a non-negative integer:

```
domain_error(non_negative_integer,Count)
```

`Mean` is a variable:

```
instantiation_error
```

`Mean` is neither a variable nor a float:

```
type_error(float,Mean)
```

`Deviation` is a variable:
`instantiation_error`
`Deviation` is neither a variable nor a float:
`type_error(float,Deviation)`
`Deviation` is a negative float:
`domain_error(non_negative_float,Deviation)`

---

standard_normal_density/2

Computes the standard normal probability density at the given value.

Compilation flags:
`static`

Template:
`standard_normal_density(Value,Density)`
Mode and number of proofs:
`standard_normal_density(+number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`

---

standard_normal_log_density/2

Computes the standard normal log-density at the given value.

Compilation flags:
`static`

Template:
`standard_normal_log_density(Value,LogDensity)`
Mode and number of proofs:
`standard_normal_log_density(+number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`

---

standard_normal_distribution/2

Computes an approximation of the standard normal cumulative distribution at the given value.

Compilation flags:
`static`

Template:
`standard_normal_distribution(Value,Probability)`
Mode and number of proofs:
`standard_normal_distribution(+number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`

---

standard_normal_quantile/2

Computes an approximation of the standard normal quantile for a probability strictly between zero and one.

Compilation flags:
`static`

Template:
`standard_normal_quantile(Probability,Quantile)`
Mode and number of proofs:
`standard_normal_quantile(+open_probability,-float)` - `one_or_error`

Exceptions:
`Probability` is a variable:
`instantiation_error`
`Probability` is neither a variable nor a float:
`type_error(float,Probability)`
`Probability` is a float but not strictly between zero and one:
`domain_error(open_probability,Probability)`

---

normal_density/4

Computes the normal probability density at a value for the given mean and positive standard deviation.

Compilation flags:
`static`

Template:
`normal_density(Value,Mean,Deviation,Density)`
Mode and number of proofs:
`normal_density(+number,+number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Mean` is a variable:
`instantiation_error`
`Mean` is neither a variable nor a number:
`type_error(number,Mean)`
`Deviation` is a variable:
`instantiation_error`
`Deviation` is neither a variable nor a number:
`type_error(number,Deviation)`
`Deviation` is a number but not a positive number:
`domain_error(positive_number,Deviation)`

---

normal_log_density/4

Computes the normal log-density at a value for the given mean and positive standard deviation.

Compilation flags:
`static`

Template:
`normal_log_density(Value,Mean,Deviation,LogDensity)`
Mode and number of proofs:
`normal_log_density(+number,+number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Mean` is a variable:
`instantiation_error`

`Mean` is neither a variable nor a number:
`type_error(number,Mean)`
`Deviation` is a variable:
`instantiation_error`
`Deviation` is neither a variable nor a number:
`type_error(number,Deviation)`
`Deviation` is a number but not a positive number:
`domain_error(positive_number,Deviation)`

`normal_distribution/4`

Computes an approximation of the normal cumulative distribution at a value for the given mean and positive standard deviation.

Compilation flags:
`static`

Template:
`normal_distribution(Value,Mean,Deviation,Probability)`
Mode and number of proofs:
`normal_distribution(+number,+number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Mean` is a variable:
`instantiation_error`
`Mean` is neither a variable nor a number:
`type_error(number,Mean)`
`Deviation` is a variable:
`instantiation_error`
`Deviation` is neither a variable nor a number:
`type_error(number,Deviation)`
`Deviation` is a number but not a positive number:
`domain_error(positive_number,Deviation)`

---

normal_quantile/4

Computes an approximation of the normal quantile for a probability strictly between zero and one and the given mean and positive standard deviation.

Compilation flags:
`static`

Template:
`normal_quantile(Probability,Mean,Deviation,Quantile)`
Mode and number of proofs:
`normal_quantile(+open_probability,+number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Probability` is a variable:
`instantiation_error`
`Probability` is neither a variable nor a float:
`type_error(float,Probability)`
`Probability` is a float but not strictly between zero and one:
`domain_error(open_probability,Probability)`
`Mean` is a variable:
`instantiation_error`
`Mean` is neither a variable nor a number:
`type_error(number,Mean)`
`Deviation` is a variable:
`instantiation_error`
`Deviation` is neither a variable nor a number:
`type_error(number,Deviation)`
`Deviation` is a number but not a positive number:
`domain_error(positive_number,Deviation)`

---

standard_t/2

Returns a standard Student's t distributed random value.

Compilation flags:
`static`

Template:
`standard_t(DegreesOfFreedom,Value)`
Mode and number of proofs:
`standard_t(+positive_number,-float)` - `one_or_error`

Exceptions:
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:

`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

standard_t_samples/3

Returns the requested number of standard Student's t distributed random values.

Compilation flags:
`static`

Template:
`standard_t_samples(Count,DegreesOfFreedom,Samples)`
Mode and number of proofs:
`standard_t_samples(+integer,+positive_number,-list(float))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

standard_t_density/3

Computes the standard Student's t probability density at the given value.

Compilation flags:
`static`

Template:
`standard_t_density(Value,DegreesOfFreedom,Density)`
Mode and number of proofs:
`standard_t_density(+number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:

instantiation_error
Value is neither a variable nor a number:
type_error(number,Value)
DegreesOfFreedom is a variable:
instantiation_error
DegreesOfFreedom is neither a variable nor a number:
type_error(number,DegreesOfFreedom)
DegreesOfFreedom is a number but not a positive number:
domain_error(positive_number,DegreesOfFreedom)

---

standard_t_log_density/3

Computes the standard Student's t log-density at the given value.

Compilation flags:
static

Template:
standard_t_log_density(Value,DegreesOfFreedom,LogDensity)
Mode and number of proofs:
standard_t_log_density(+number,+positive_number,-float) - one_or_error

Exceptions:
Value is a variable:
instantiation_error
Value is neither a variable nor a number:
type_error(number,Value)
DegreesOfFreedom is a variable:
instantiation_error
DegreesOfFreedom is neither a variable nor a number:
type_error(number,DegreesOfFreedom)
DegreesOfFreedom is a number but not a positive number:
domain_error(positive_number,DegreesOfFreedom)

---

standard_t_distribution/3

Computes an approximation of the standard Student's t cumulative distribution at the given value.

Compilation flags:
static

Template:
standard_t_distribution(Value,DegreesOfFreedom,Probability)
Mode and number of proofs:
standard_t_distribution(+number,+positive_number,-float) - one_or_error

Exceptions:

`Value` is a variable:

`instantiation_error`

`Value` is neither a variable nor a number:

`type_error(number,Value)`

`DegreesOfFreedom` is a variable:

`instantiation_error`

`DegreesOfFreedom` is neither a variable nor a number:

`type_error(number,DegreesOfFreedom)`

`DegreesOfFreedom` is a number but not a positive number:

`domain_error(positive_number,DegreesOfFreedom)`

`standard_t_quantile/3`

Computes an approximation of the standard Student's t quantile for a probability strictly between zero and one.

Compilation flags:

`static`

Template:

`standard_t_quantile(Probability,DegreesOfFreedom,Quantile)`

Mode and number of proofs:

`standard_t_quantile(+open_probability,+positive_number,-float)` - `one_or_error`

Exceptions:

`Probability` is a variable:

`instantiation_error`

`Probability` is neither a variable nor a float:

`type_error(float,Probability)`

`Probability` is a float but not strictly between zero and one:

`domain_error(open_probability,Probability)`

`DegreesOfFreedom` is a variable:

`instantiation_error`

`DegreesOfFreedom` is neither a variable nor a number:

`type_error(number,DegreesOfFreedom)`

`DegreesOfFreedom` is a number but not a positive number:

`domain_error(positive_number,DegreesOfFreedom)`

---

t/4

Returns a location-scale Student's t distributed random value.

Compilation flags:
`static`

Template:
`t(Location,Scale,DegreesOfFreedom,Value)`
Mode and number of proofs:
`t(+number,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Location` is a variable:
`instantiation_error`
`Location` is neither a variable nor a number:
`type_error(number,Location)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

t_samples/5

Returns the requested number of location-scale Student's t distributed random values.

Compilation flags:
`static`

Template:
`t_samples(Count,Location,Scale,DegreesOfFreedom,Samples)`
Mode and number of proofs:
`t_samples(+integer,+number,+positive_number,+positive_number,-list(float))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:

`type_error(integer,Count)`

`Count` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Count)`

`Location` is a variable:

`instantiation_error`

`Location` is neither a variable nor a number:

`type_error(number,Location)`

`Scale` is a variable:

`instantiation_error`

`Scale` is neither a variable nor a number:

`type_error(number,Scale)`

`Scale` is not positive:

`domain_error(positive_number,Scale)`

`DegreesOfFreedom` is a variable:

`instantiation_error`

`DegreesOfFreedom` is neither a variable nor a number:

`type_error(number,DegreesOfFreedom)`

`DegreesOfFreedom` is a number but not a positive number:

`domain_error(positive_number,DegreesOfFreedom)`

`t_density/5`

Computes the location-scale Student's t probability density.

Compilation flags:

`static`

Template:

`t_density(Value,Location,Scale,DegreesOfFreedom,Density)`

Mode and number of proofs:

`t_density(+number,+number,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:

`Value` is a variable:

`instantiation_error`

`Value` is neither a variable nor a number:

`type_error(number,Value)`

`Location` is a variable:

`instantiation_error`

`Location` is neither a variable nor a number:

`type_error(number,Location)`

`Scale` is a variable:

`instantiation_error`

`Scale` is neither a variable nor a number:

`type_error(number,Scale)`

`Scale` is not positive:

`domain_error(positive_number,Scale)`

`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

t_log_density/5

Computes the location-scale Student's t log-density.

Compilation flags:
`static`

Template:
`t_log_density(Value,Location,Scale,DegreesOfFreedom,LogDensity)`
Mode and number of proofs:
`t_log_density(+number,+number,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Location` is a variable:
`instantiation_error`
`Location` is neither a variable nor a number:
`type_error(number,Location)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

t_distribution/5

Computes an approximation of the location-scale Student's t cumulative distribution.

Compilation flags:
`static`

Template:
`t_distribution(Value,Location,Scale,DegreesOfFreedom,Probability)`
Mode and number of proofs:
`t_distribution(+number,+number,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Location` is a variable:
`instantiation_error`
`Location` is neither a variable nor a number:
`type_error(number,Location)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

t_quantile/5

Computes an approximation of the location-scale Student's t quantile for a probability strictly between zero and one.

Compilation flags:
`static`

Template:
`t_quantile(Probability,Location,Scale,DegreesOfFreedom,Quantile)`
Mode and number of proofs:
`t_quantile(+open_probability,+number,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:

`Probability` is a variable:
`instantiation_error`
`Probability` is neither a variable nor a float:
`type_error(float,Probability)`
`Probability` is a float but not strictly between zero and one:
`domain_error(open_probability,Probability)`
`Location` is a variable:
`instantiation_error`
`Location` is neither a variable nor a number:
`type_error(number,Location)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

`chi_squared/2`

Returns a chi-squared distributed random value.

Compilation flags:

`static`

Template:

`chi_squared(DegreesOfFreedom,Value)`

Mode and number of proofs:

`chi_squared(+positive_number,-float)` - `one_or_error`

Exceptions:

`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

chi_squared_samples/3

Returns the requested number of chi-squared distributed random values.

Compilation flags:
`static`

Template:
`chi_squared_samples(Count,DegreesOfFreedom,Samples)`
Mode and number of proofs:
`chi_squared_samples(+integer,+positive_number,-list(float))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom)`
`DegreesOfFreedom` is a number but not a positive number:
`domain_error(positive_number,DegreesOfFreedom)`

---

chi_squared_density/3

Computes the chi-squared probability density at the given value. At zero, returns the atom `positive_infinity` when the degrees of freedom are smaller than two.

Compilation flags:
`static`

Template:
`chi_squared_density(Value,DegreesOfFreedom,Density)`
Mode and number of proofs:
`chi_squared_density(+number,+positive_number,-atomic)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`DegreesOfFreedom` is a variable:
`instantiation_error`
`DegreesOfFreedom` is neither a variable nor a number:

type_error(number,DegreesOfFreedom)
DegreesOfFreedom is a number but not a positive number:
domain_error(positive_number,DegreesOfFreedom)

---

chi_squared_log_density/3

Computes the chi-squared log-density at the given value. Returns the atoms positive_infinity or negative_infinity when the density is respectively infinite or zero.

Compilation flags:
static

Template:
chi_squared_log_density(Value,DegreesOfFreedom,LogDensity)
Mode and number of proofs:
chi_squared_log_density(+number,+positive_number,-atomic) - one_or_error

Exceptions:
Value is a variable:
instantiation_error
Value is neither a variable nor a number:
type_error(number,Value)
DegreesOfFreedom is a variable:
instantiation_error
DegreesOfFreedom is neither a variable nor a number:
type_error(number,DegreesOfFreedom)
DegreesOfFreedom is a number but not a positive number:
domain_error(positive_number,DegreesOfFreedom)

---

chi_squared_distribution/3

Computes an approximation of the chi-squared cumulative distribution at the given value.

Compilation flags:
static

Template:
chi_squared_distribution(Value,DegreesOfFreedom,Probability)
Mode and number of proofs:
chi_squared_distribution(+number,+positive_number,-float) - one_or_error

Exceptions:
Value is a variable:
instantiation_error
Value is neither a variable nor a number:

type_error(number,Value)
DegreesOfFreedom is a variable:
instantiation_error
DegreesOfFreedom is neither a variable nor a number:
type_error(number,DegreesOfFreedom)
DegreesOfFreedom is a number but not a positive number:
domain_error(positive_number,DegreesOfFreedom)

---

chi_squared_quantile/3

Computes an approximation of the chi-squared quantile for a probability strictly between zero and one.

Compilation flags:
static

Template:
chi_squared_quantile(Probability,DegreesOfFreedom,Quantile)
Mode and number of proofs:
chi_squared_quantile(+open_probability,+positive_number,-float) - one_or_error

Exceptions:
Probability is a variable:
instantiation_error
Probability is neither a variable nor a float:
type_error(float,Probability)
Probability is a float but not strictly between zero and one:
domain_error(open_probability,Probability)
DegreesOfFreedom is a variable:
instantiation_error
DegreesOfFreedom is neither a variable nor a number:
type_error(number,DegreesOfFreedom)
DegreesOfFreedom is a number but not a positive number:
domain_error(positive_number,DegreesOfFreedom)

---

gamma/3

Returns a gamma distributed random value (shape-scale parameterization).

Compilation flags:
static

Template:
gamma(Shape,Scale,Value)
Mode and number of proofs:
gamma(+positive_number,+positive_number,-float) - one_or_error

Exceptions:

`Shape` is a variable:

`instantiation_error`

`Shape` is neither a variable nor a number:

`type_error(number,Shape)`

`Shape` is not positive:

`domain_error(positive_number,Shape)`

`Scale` is a variable:

`instantiation_error`

`Scale` is neither a variable nor a number:

`type_error(number,Scale)`

`Scale` is not positive:

`domain_error(positive_number,Scale)`

---

gamma_samples/4

Returns the requested number of gamma distributed random values.

Compilation flags:

`static`

Template:

`gamma_samples(Count,Shape,Scale,Samples)`

Mode and number of proofs:

`gamma_samples(+integer,+positive_number,+positive_number,-list(float))` - `one_or_error`

Exceptions:

`Count` is a variable:

`instantiation_error`

`Count` is neither a variable nor an integer:

`type_error(integer,Count)`

`Count` is an integer but not a non-negative integer:

`domain_error(non_negative_integer,Count)`

`Shape` is a variable:

`instantiation_error`

`Shape` is neither a variable nor a number:

`type_error(number,Shape)`

`Shape` is not positive:

`domain_error(positive_number,Shape)`

`Scale` is a variable:

`instantiation_error`

`Scale` is neither a variable nor a number:

`type_error(number,Scale)`

`Scale` is not positive:

`domain_error(positive_number,Scale)`

---

gamma_density/4

Computes the gamma probability density at the given value. At zero, returns the atom positive_infinity when the shape is smaller than one.

Compilation flags:

static

Template:

gamma_density(Value,Shape,Scale,Density)

Mode and number of proofs:

gamma_density(+number,+positive_number,+positive_number,-atomic) - one_or_error

Exceptions:

Value is a variable:

instantiation_error

Value is neither a variable nor a number:

type_error(number,Value)

Shape is a variable:

instantiation_error

Shape is neither a variable nor a number:

type_error(number,Shape)

Shape is not positive:

domain_error(positive_number,Shape)

Scale is a variable:

instantiation_error

Scale is neither a variable nor a number:

type_error(number,Scale)

Scale is not positive:

domain_error(positive_number,Scale)

---

gamma_log_density/4

Computes the gamma log-density at the given value. Returns the atoms positive_infinity or negative_infinity when the density is respectively infinite or zero.

Compilation flags:

static

Template:

gamma_log_density(Value,Shape,Scale,LogDensity)

Mode and number of proofs:

gamma_log_density(+number,+positive_number,+positive_number,-atomic) - one_or_error

Exceptions:

Value is a variable:

instantiation_error

`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Shape` is a variable:
`instantiation_error`
`Shape` is neither a variable nor a number:
`type_error(number,Shape)`
`Shape` is not positive:
`domain_error(positive_number,Shape)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`

---

gamma_distribution/4

Computes an approximation of the gamma cumulative distribution at the given value.

Compilation flags:
`static`

Template:
`gamma_distribution(Value,Shape,Scale,Probability)`
Mode and number of proofs:
`gamma_distribution(+number,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Shape` is a variable:
`instantiation_error`
`Shape` is neither a variable nor a number:
`type_error(number,Shape)`
`Shape` is not positive:
`domain_error(positive_number,Shape)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`

---

gamma_quantile/4

Computes an approximation of the gamma quantile for a probability strictly between zero and one.

Compilation flags:
`static`

Template:
`gamma_quantile(Probability,Shape,Scale,Quantile)`
Mode and number of proofs:
`gamma_quantile(+open_probability,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Probability` is a variable:
`instantiation_error`
`Probability` is neither a variable nor a float:
`type_error(float,Probability)`
`Probability` is a float but not strictly between zero and one:
`domain_error(open_probability,Probability)`
`Shape` is a variable:
`instantiation_error`
`Shape` is neither a variable nor a number:
`type_error(number,Shape)`
`Shape` is not positive:
`domain_error(positive_number,Shape)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`

---

beta/3

Returns a beta distributed random value.

Compilation flags:
`static`

Template:
`beta(Alpha,Beta,Value)`
Mode and number of proofs:
`beta(+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Alpha` is a variable:

`instantiation_error`
`Alpha` is neither a variable nor a number:
`type_error(number,Alpha)`
`Alpha` is not positive:
`domain_error(positive_number,Alpha)`
`Beta` is a variable:
`instantiation_error`
`Beta` is neither a variable nor a number:
`type_error(number,Beta)`
`Beta` is not positive:
`domain_error(positive_number,Beta)`

---

beta_samples/4

Returns the requested number of beta distributed random values.

Compilation flags:
`static`

Template:
`beta_samples(Count,Alpha,Beta,Samples)`
Mode and number of proofs:
`beta_samples(+integer,+positive_number,+positive_number,-list(float))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`Alpha` is a variable:
`instantiation_error`
`Alpha` is neither a variable nor a number:
`type_error(number,Alpha)`
`Alpha` is not positive:
`domain_error(positive_number,Alpha)`
`Beta` is a variable:
`instantiation_error`
`Beta` is neither a variable nor a number:
`type_error(number,Beta)`
`Beta` is not positive:
`domain_error(positive_number,Beta)`

---

beta_density/4

Computes the beta probability density at the given value. At either endpoint, returns the atom positive_infinity when the corresponding shape parameter is smaller than one.

Compilation flags:

static

Template:

beta_density(Value,Alpha,Beta,Density)

Mode and number of proofs:

beta_density(+number,+positive_number,+positive_number,-atomic) - one_or_error

Exceptions:

Value is a variable:

instantiation_error

Value is neither a variable nor a number:

type_error(number,Value)

Alpha is a variable:

instantiation_error

Alpha is neither a variable nor a number:

type_error(number,Alpha)

Alpha is not positive:

domain_error(positive_number,Alpha)

Beta is a variable:

instantiation_error

Beta is neither a variable nor a number:

type_error(number,Beta)

Beta is not positive:

domain_error(positive_number,Beta)

---

beta_log_density/4

Computes the beta log-density at the given value. Returns the atoms positive_infinity or negative_infinity when the density is respectively infinite or zero.

Compilation flags:

static

Template:

beta_log_density(Value,Alpha,Beta,LogDensity)

Mode and number of proofs:

beta_log_density(+number,+positive_number,+positive_number,-atomic) - one_or_error

Exceptions:

Value is a variable:

instantiation_error

`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Alpha` is a variable:
`instantiation_error`
`Alpha` is neither a variable nor a number:
`type_error(number,Alpha)`
`Alpha` is not positive:
`domain_error(positive_number,Alpha)`
`Beta` is a variable:
`instantiation_error`
`Beta` is neither a variable nor a number:
`type_error(number,Beta)`
`Beta` is not positive:
`domain_error(positive_number,Beta)`

---

beta_distribution/4

Computes an approximation of the beta cumulative distribution at the given value.

Compilation flags:
`static`

Template:
`beta_distribution(Value,Alpha,Beta,Probability)`
Mode and number of proofs:
`beta_distribution(+number,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Alpha` is a variable:
`instantiation_error`
`Alpha` is neither a variable nor a number:
`type_error(number,Alpha)`
`Alpha` is not positive:
`domain_error(positive_number,Alpha)`
`Beta` is a variable:
`instantiation_error`
`Beta` is neither a variable nor a number:
`type_error(number,Beta)`
`Beta` is not positive:
`domain_error(positive_number,Beta)`

---

beta_quantile/4

Computes an approximation of the beta quantile for a probability strictly between zero and one.

Compilation flags:
`static`

Template:
`beta_quantile(Probability,Alpha,Beta,Quantile)`
Mode and number of proofs:
`beta_quantile(+open_probability,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Probability` is a variable:
`instantiation_error`
`Probability` is neither a variable nor a float:
`type_error(float,Probability)`
`Probability` is a float but not strictly between zero and one:
`domain_error(open_probability,Probability)`
`Alpha` is a variable:
`instantiation_error`
`Alpha` is neither a variable nor a number:
`type_error(number,Alpha)`
`Alpha` is not positive:
`domain_error(positive_number,Alpha)`
`Beta` is a variable:
`instantiation_error`
`Beta` is neither a variable nor a number:
`type_error(number,Beta)`
`Beta` is not positive:
`domain_error(positive_number,Beta)`

---

exponential/2

Returns an exponentially distributed random value (scale parameterization).

Compilation flags:
`static`

Template:
`exponential(Scale,Value)`
Mode and number of proofs:
`exponential(+positive_number,-float)` - `one_or_error`

Exceptions:
`Scale` is a variable:

`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`

---

exponential_samples/3

Returns the requested number of exponentially distributed random values.

Compilation flags:
`static`

Template:
`exponential_samples(Count,Scale,Samples)`
Mode and number of proofs:
`exponential_samples(+integer,+positive_number,-list(float))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`

---

exponential_density/3

Computes the exponential probability density at the given value.

Compilation flags:
`static`

Template:
`exponential_density(Value,Scale,Density)`
Mode and number of proofs:
`exponential_density(+number,+positive_number,-float)` - `one_or_error`

Exceptions:

`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`

---

exponential_log_density/3

Computes the exponential log-density at the given value.

Compilation flags:
`static`

Template:
`exponential_log_density(Value,Scale,LogDensity)`
Mode and number of proofs:
`exponential_log_density(+number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Value` is a variable:
`instantiation_error`
`Value` is neither a variable nor a number:
`type_error(number,Value)`
`Scale` is a variable:
`instantiation_error`
`Scale` is neither a variable nor a number:
`type_error(number,Scale)`
`Scale` is not positive:
`domain_error(positive_number,Scale)`

---

exponential_distribution/3

Computes the exponential cumulative distribution at the given value.

Compilation flags:
`static`

Template:
`exponential_distribution(Value,Scale,Probability)`
Mode and number of proofs:

```
exponential_distribution(+number,+positive_number,-float) - one_or_error
```

Exceptions:

`Value` is a variable:

```
instantiation_error
```

`Value` is neither a variable nor a number:

```
type_error(number,Value)
```

`Scale` is a variable:

```
instantiation_error
```

`Scale` is neither a variable nor a number:

```
type_error(number,Scale)
```

`Scale` is not positive:

```
domain_error(positive_number,Scale)
```

---

exponential_quantile/3

Computes the exponential quantile for a probability strictly between zero and one.

Compilation flags:

```
static
```

Template:

```
exponential_quantile(Probability,Scale,Quantile)
```

Mode and number of proofs:

```
exponential_quantile(+open_probability,+positive_number,-float) - one_or_error
```

Exceptions:

`Probability` is a variable:

```
instantiation_error
```

`Probability` is neither a variable nor a float:

```
type_error(float,Probability)
```

`Probability` is a float but not strictly between zero and one:

```
domain_error(open_probability,Probability)
```

`Scale` is a variable:

```
instantiation_error
```

`Scale` is neither a variable nor a number:

```
type_error(number,Scale)
```

`Scale` is not positive:

```
domain_error(positive_number,Scale)
```

---

fisher/3

Returns a Fisher-Snedecor (F) distributed random value.

Compilation flags:
`static`

Template:
`fisher(DegreesOfFreedom1,DegreesOfFreedom2,Value)`
Mode and number of proofs:
`fisher(+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`DegreesOfFreedom1` is a variable:
`instantiation_error`
`DegreesOfFreedom1` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom1)`
`DegreesOfFreedom1` is not positive:
`domain_error(positive_number,DegreesOfFreedom1)`
`DegreesOfFreedom2` is a variable:
`instantiation_error`
`DegreesOfFreedom2` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom2)`
`DegreesOfFreedom2` is not positive:
`domain_error(positive_number,DegreesOfFreedom2)`

---

fisher_samples/4

Returns the requested number of Fisher-Snedecor (F) distributed random values.

Compilation flags:
`static`

Template:
`fisher_samples(Count,DegreesOfFreedom1,DegreesOfFreedom2,Samples)`
Mode and number of proofs:
`fisher_samples(+integer,+positive_number,+positive_number,-list(float))` - `one_or_error`

Exceptions:
`Count` is a variable:
`instantiation_error`
`Count` is neither a variable nor an integer:
`type_error(integer,Count)`
`Count` is an integer but not a non-negative integer:
`domain_error(non_negative_integer,Count)`
`DegreesOfFreedom1` is a variable:

instantiation_error
DegreesOfFreedom1 is neither a variable nor a number:
type_error(number,DegreesOfFreedom1)
DegreesOfFreedom1 is not positive:
domain_error(positive_number,DegreesOfFreedom1)
DegreesOfFreedom2 is a variable:
instantiation_error
DegreesOfFreedom2 is neither a variable nor a number:
type_error(number,DegreesOfFreedom2)
DegreesOfFreedom2 is not positive:
domain_error(positive_number,DegreesOfFreedom2)

---

fisher_density/4

Computes the Fisher-Snedecor (F) probability density at the given value. At zero, returns the atom positive_infinity when the first degrees of freedom are smaller than two.

Compilation flags:
static

Template:
fisher_density(Value,DegreesOfFreedom1,DegreesOfFreedom2,Density)
Mode and number of proofs:
fisher_density(+number,+positive_number,+positive_number,-atomic) - one_or_error

Exceptions:
Value is a variable:
instantiation_error
Value is neither a variable nor a number:
type_error(number,Value)
DegreesOfFreedom1 is a variable:
instantiation_error
DegreesOfFreedom1 is neither a variable nor a number:
type_error(number,DegreesOfFreedom1)
DegreesOfFreedom1 is not positive:
domain_error(positive_number,DegreesOfFreedom1)
DegreesOfFreedom2 is a variable:
instantiation_error
DegreesOfFreedom2 is neither a variable nor a number:
type_error(number,DegreesOfFreedom2)
DegreesOfFreedom2 is not positive:
domain_error(positive_number,DegreesOfFreedom2)

---

fisher_log_density/4

Computes the Fisher-Snedecor (F) log-density at the given value. Returns the atoms positive_infinity or negative_infinity when the density is respectively infinite or zero.

Compilation flags:

static

Template:

fisher_log_density(Value,DegreesOfFreedom1,DegreesOfFreedom2,LogDensity)

Mode and number of proofs:

fisher_log_density(+number,+positive_number,+positive_number,-atomic) - one_or_error

Exceptions:

Value is a variable:

instantiation_error

Value is neither a variable nor a number:

type_error(number,Value)

DegreesOfFreedom1 is a variable:

instantiation_error

DegreesOfFreedom1 is neither a variable nor a number:

type_error(number,DegreesOfFreedom1)

DegreesOfFreedom1 is not positive:

domain_error(positive_number,DegreesOfFreedom1)

DegreesOfFreedom2 is a variable:

instantiation_error

DegreesOfFreedom2 is neither a variable nor a number:

type_error(number,DegreesOfFreedom2)

DegreesOfFreedom2 is not positive:

domain_error(positive_number,DegreesOfFreedom2)

---

fisher_distribution/4

Computes an approximation of the Fisher-Snedecor (F) cumulative distribution at the given value.

Compilation flags:

static

Template:

fisher_distribution(Value,DegreesOfFreedom1,DegreesOfFreedom2,Probability)

Mode and number of proofs:

fisher_distribution(+number,+positive_number,+positive_number,-float) - one_or_error

Exceptions:

Value is a variable:

instantiation_error

`Value` is neither a variable nor a number:
`type_error(number,Value)`
`DegreesOfFreedom1` is a variable:
`instantiation_error`
`DegreesOfFreedom1` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom1)`
`DegreesOfFreedom1` is not positive:
`domain_error(positive_number,DegreesOfFreedom1)`
`DegreesOfFreedom2` is a variable:
`instantiation_error`
`DegreesOfFreedom2` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom2)`
`DegreesOfFreedom2` is not positive:
`domain_error(positive_number,DegreesOfFreedom2)`

`fisher_quantile/4`

Computes an approximation of the Fisher-Snedecor (F) quantile for a probability strictly between zero and one.

Compilation flags:
`static`

Template:
`fisher_quantile(Probability,DegreesOfFreedom1,DegreesOfFreedom2,Quantile)`
Mode and number of proofs:
`fisher_quantile(+open_probability,+positive_number,+positive_number,-float)` - `one_or_error`

Exceptions:
`Probability` is a variable:
`instantiation_error`
`Probability` is neither a variable nor a float:
`type_error(float,Probability)`
`Probability` is a float but not strictly between zero and one:
`domain_error(open_probability,Probability)`
`DegreesOfFreedom1` is a variable:
`instantiation_error`
`DegreesOfFreedom1` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom1)`
`DegreesOfFreedom1` is not positive:
`domain_error(positive_number,DegreesOfFreedom1)`
`DegreesOfFreedom2` is a variable:
`instantiation_error`
`DegreesOfFreedom2` is neither a variable nor a number:
`type_error(number,DegreesOfFreedom2)`
`DegreesOfFreedom2` is not positive:
`domain_error(positive_number,DegreesOfFreedom2)`

1.345 uri_template

object

1.345.1 `uri_template(Representation)`

- `Representation` - URI template, variable name, variable value, and expansion representation. Valid values are `atom`, `codes`, and `chars`.

URI template validation, variable enumeration, and expansion predicates implementing RFC 6570.

Availability:
`logtalk_load(uri_template(loader))`

Author: Paulo Moura
Version: 1:1:0
Date: 2026-09-24

Compilation flags:
`static, context_switching_calls`

Uses:
list
utf_8_character_set

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *valid/1*
  - *variables/2*
  - *expand/3*
  - *expand/4*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

valid/1

True iff the argument is a valid RFC 6570 URI template.

Compilation flags:
`static`

Template:
`valid(Template)`
Mode and number of proofs:
`valid(++text)` - `zero_or_one`

---

variables/2

Returns the unique template variable names in first-seen order.

Compilation flags:
`static`

Template:
`variables(Template,Variables)`
Mode and number of proofs:
`variables(++text,-list(text))` - `zero_or_one`

---

expand/3

Expands a valid RFC 6570 URI template using a list of `Name-Value` bindings. Values are represented by `undefined`, `string(Text)`, `list(Texts)`, `assoc(Pairs)`, or `structure(Pairs)` terms.

Compilation flags:
`static`

Template:

```
expand(Template,Bindings,Expansion)
```

Mode and number of proofs:

```
expand(++text,+list(pair),-text) - zero_or_one
```

---

expand/4

Expands an RFC 6570 URI template while recovering from template syntax errors. Malformed expressions are copied unexpanded and processing continues. For an invalid literal or unterminated expression, the unprocessed remainder is copied and processing stops. Errors are returned as zero-based `error(Position, Reason)` terms.

Compilation flags:

```
static
```

Template:

```
expand(Template,Bindings,Expansion,Errors)
```

Mode and number of proofs:

```
expand(++text,+list(pair),-text,-list(compound)) - zero_or_one
```

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

1.346 url

object

1.346.1 url(Representation)

- `Representation` - URL and is components representation. Valid values are `atom`, `codes`, and `chars`.

URL validating, parsing, and normalizing predicates following RFC3986 nomenclature.

Availability:

```
logtalk_load(url(loader))
```

Author: Paulo Moura
Version: 2:0:0
Date: 2026-05-22

Compilation flags:
`static, context_switching_calls`

Uses:
list

Remarks:
(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *valid/1*
  - *parse/2*
  - *generate/2*
  - *parse/3*
  - *reference_kind/2*
  - *equivalent/2*
  - *relativize/3*
  - *resolve/3*
  - *normalize/2*
  - *file_path_components/2*
- *Protected predicates*
- *Private predicates*
  - *downcase_text/2*
- *Operators*

Public predicates

valid/1

True iff the argument is a valid URL, including optional query and fragment components.

Compilation flags:
`static`

Template:
`valid(URL)`
Mode and number of proofs:
`valid(++text)` - `zero_or_one`

parse/2

Parses a URL into a list of its components: `[scheme(Scheme), authority(Authority), path(Path), query(Query), fragment(Fragment)]`. Fails if the URL is invalid and cannot be parsed.

Compilation flags:
`static`

Template:
`parse(URL,Components)`
Mode and number of proofs:
`parse(++text,-list(compound))` - `zero_or_one`

---

generate/2

Generates a normalized URL or RFC3986 relative reference from a list of components. Component lists headed by `scheme/1` generate absolute URLs; lists without `scheme/1` generate relative references.

Compilation flags:
`static`

Template:
`generate(Components,URL)`
Mode and number of proofs:
`generate(++list(compound),-text)` - `zero_or_one`

---

parse/3

Parses a URL or RFC3986 relative reference into a list of its components and classifies it as one of `url`, `network_path`, `absolute_path`, `relative_path`, `query`, or `fragment`.

Compilation flags:
`static`

Template:
`parse(Reference,Components,Kind)`
Mode and number of proofs:
`parse(++text,-list(compound),-atom)` - `zero_or_one`

---

reference_kind/2

Classifies a valid reference as one of `url`, `network_path`, `absolute_path`, `relative_path`, `query`, or `fragment`.

Compilation flags:
`static`

Template:
`reference_kind(Reference,Kind)`
Mode and number of proofs:
`reference_kind(++text,-atom)` - `zero_or_one`

---

equivalent/2

True iff both arguments normalize to the same textual representation under the library normalization rules.

Compilation flags:
`static`

Template:
`equivalent(Reference1,Reference2)`
Mode and number of proofs:
`equivalent(++text,++text)` - `zero_or_one`

---

relativize/3

Relativizes a target absolute hierarchical URL against a base absolute hierarchical URL with the same scheme and authority, returning a non-empty relative reference accepted by the library. Fails when no such non-empty relative reference can be generated.

Compilation flags:
`static`

Template:
`relativize(Base,Target,Relative)`
Mode and number of proofs:
`relativize(++text,++text,-text)` - `zero_or_one`

---

resolve/3

Resolves a reference against a base absolute hierarchical URL and returns a normalized absolute URL. The first argument must be an absolute hierarchical URL suitable for use as a base. The second argument may be either a relative reference or an absolute URL; when it is already absolute, the result is that absolute URL normalized and returned unchanged apart from normalization.

Compilation flags:

```
static
```

Template:

```
resolve(Base,Reference,Resolved)
```

Mode and number of proofs:

```
resolve(++text,++text,-text) - zero_or_one
```

---

normalize/2

Normalizes a URL or RFC3986 relative reference by standardizing its components. Normalization includes converting the scheme to lowercase when present, normalizing the authority, percent-encoding characters that require escaping, and simplifying path dot segments while preserving absolute and relative reference forms.

Compilation flags:

```
static
```

Template:

```
normalize(Reference,NormalizedReference)
```

Mode and number of proofs:

```
normalize(++text,-text) - one
```

---

file_path_components/2

Converts a file-system path into file URL components represented as `[authority(Authority), path(Path)]`. Windows drive-letter and UNC paths are normalized to RFC3986-compatible file URL components.

Compilation flags:

```
static
```

Template:

```
file_path_components(FilePath,Components)
```

Mode and number of proofs:

```
file_path_components(++text,-list(compound)) - one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

`downcase_text/2`

Converts text to lowercase (ASCII only). Only uppercase letters A-Z are converted to lowercase.

Compilation flags:
`static`

Template:
`downcase_text(Text,LowerText)`
Mode and number of proofs:
`downcase_text(+text,-text) - one`

Operators

(none)

1.347 uuid

object

1.347.1 `uuid`

Universally unique identifier (UUID) generator using an atom representation.

Public predicates

uuid_v1/2

Returns a version 1 UUID for the given MAC address (a list of six bytes). The MAC address can be replaced by a random 6 bytes node identifier as per RFC 4122 when the MAC address is not available or should not be disclosed. Portability note: some backends only provide access to local time; use `uuid_v1/3` with an explicit UTC offset when a UTC timestamp is required.

Compilation flags:
`static`

Template:
`uuid_v1(MAC,UUID)`
Mode and number of proofs:
`uuid_v1(+list(byte),--text)-one`

uuid_v1/3

Returns a version 1 UUID for the given MAC address (a list of six bytes) using the given local UTC offset (`Z` or `+HH:MM`/`-HH:MM`) to convert the backend local time to UTC. The MAC address can be replaced by a random 6 bytes node identifier as per RFC 4122 when the MAC address is not available or should not be disclosed.

Compilation flags:

```
static
```

Template:

```
uuid_v1(MAC,Offset,UUID)
```

Mode and number of proofs:

```
uuid_v1(+list(byte),+atom,--text) - zero_or_one
```

---

uuid_v3/3

Returns a version 3 UUID for the given namespace UUID and name. Namespace UUIDs and names can be represented as atoms, lists of characters, or lists of character codes. Name character codes must be bytes.

Compilation flags:

```
static
```

Template:

```
uuid_v3(Namespace,Name,UUID)
```

Mode and number of proofs:

```
uuid_v3(+text,+text,--text) - one
```

---

uuid_v4/1

Returns a version 4 UUID.

Compilation flags:

```
static
```

Template:

```
uuid_v4(UUID)
```

Mode and number of proofs:

```
uuid_v4(--text) - one
```

---

uuid_v5/3

Returns a version 5 UUID for the given namespace UUID and name. Namespace UUIDs and names can be represented as atoms, lists of characters, or lists of character codes. Name character codes must be bytes.

Compilation flags:
`static`

Template:
`uuid_v5(Namespace,Name,UUID)`
Mode and number of proofs:
`uuid_v5(+text,+text,--text)` - `one`

---

uuid_v7/1

Returns a version 7 UUID. Portability note: some backends only provide access to local time; use `uuid_v7/2` with an explicit UTC offset when a UTC timestamp is required.

Compilation flags:
`static`

Template:
`uuid_v7(UUID)`
Mode and number of proofs:
`uuid_v7(--text)` - `one`

---

uuid_v7/2

Returns a version 7 UUID using the given local UTC offset (`Z` or `+HH:MM`/`-HH:MM`) to convert the backend local time to UTC.

Compilation flags:
`static`

Template:
`uuid_v7(Offset,UUID)`
Mode and number of proofs:
`uuid_v7(+atom,--text)` - `zero_or_one`

---

uuid_null/1

Returns the null UUID. Deprecated. Use `uuid_nil/1` instead.

Compilation flags:
`static`

Template:
`uuid_null(UUID)`
Mode and number of proofs:
`uuid_null(--text)` - `one`

---

uuid_nil/1

Returns the Nil UUID.

Compilation flags:
`static`

Template:
`uuid_nil(UUID)`
Mode and number of proofs:
`uuid_nil(--text)` - `one`

---

uuid_max/1

Returns the Max UUID.

Compilation flags:
`static`

Template:
`uuid_max(UUID)`
Mode and number of proofs:
`uuid_max(--text)` - `one`

`random_node/1`

Generates a list with six random bytes that can be used in alternative to a MAC address when generating version 1 UUIDs.

Compilation flags:
`static`

Template:
`random_node(Node)`
Mode and number of proofs:
`random_node(--list(byte))` - `one`

Protected predicates

Private predicates

(none)

Operators

(none)

1.348 validations

object

1.348.1 `validated`

Types and predicates for type-checking and handling lists of validation terms. Inspired by Scala Cats and Kotlin Arrow.

Availability:
`logtalk_load(validations(loader))`

Author: Paulo Moura
Version: 1:0:0
Date: 2026-02-22

Compilation flags:
`static, context_switching_calls`

Provides:
type::type/1
type::check/2
arbitrary::arbitrary/1
arbitrary::arbitrary/2
arbitrary::shrinker/1

arbitrary::shrink/3
arbitrary::edge_case/2

Uses:

list
random
type

Remarks:

- Type-checking support: Defines a `validated(ValueType, ErrorType)` type for checking validation terms where the value and error terms must be of the given types.
- QuickCheck support: Defines clauses for the `type::arbitrary/1-2`, `arbitrary::shrinker/1`, `arbitrary::shrink/3`, and `arbitrary::edge_case/2` predicates to allow generating random values for the `validated(ValueType, ErrorType)` type.

Inherited public predicates:

(none)

- *Public predicates*
  - *valids/2*
  - *invalids/2*
  - *partition/3*
  - *map/3*
  - *map/4*
  - *sequence/2*
  - *traverse/3*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

valids/2

Returns the values stored in validation terms that hold valid values.

Compilation flags:

`static`

Template:

`valids(Validations,Values)`

Mode and number of proofs:

`valids(+list(validation),-list)` - `one`

invalids/2

Returns a flattened list with all errors stored in invalid validation terms.

Compilation flags:
```
static
```

Template:
```
invalids(Validations,Errors)
```
Mode and number of proofs:
```
invalids(+list(validation),-list) - one
```

---

partition/3

Retrieves and partitions valid values and flattened accumulated errors from validation terms.

Compilation flags:
```
static
```

Template:
```
partition(Validations,Values,Errors)
```
Mode and number of proofs:
```
partition(+list(validation),-list,-list) - one
```

---

map/3

Applies a closure to each list element to generate validation terms and returns a pair `Values-Errors` accumulating all valid values and all errors in one pass.

Compilation flags:
```
static
```

Template:
```
map(Closure,Terms,ValuesErrors)
```
Meta-predicate template:
```
map(2,*,*)
```
Mode and number of proofs:
```
map(+callable,+list,--compound) - one
```

---

map/4

Applies a closure to each list element to generate validation terms and returns valid values and accumulated errors in one pass.

Compilation flags:
```
static
```

Template:
```
map(Closure,Terms,Values,Errors)
```
Meta-predicate template:
```
map(2,*,*,*)
```
Mode and number of proofs:
```
map(+callable,+list,-list,-list) - one
```

---

sequence/2

Sequences a list of validation terms into a single validation term, accumulating all errors.

Compilation flags:
```
static
```

Template:
```
sequence(Validations,Validation)
```
Mode and number of proofs:
```
sequence(+list(validation),--nonvar) - one
```

---

traverse/3

Applies a closure to each list element to generate validation terms and then sequences them, accumulating all errors.

Compilation flags:
```
static
```

Template:
```
traverse(Closure,Terms,Validation)
```
Meta-predicate template:
```
traverse(2,*,*)
```
Mode and number of proofs:
```
traverse(+callable,+list,--nonvar) - one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

validation, *validation(Validation)*, *type*, *arbitrary*

object

1.348.2 `validation`

Constructors for validation terms. A validation term is either `valid(Value)` or `invalid(Errors)` where `Errors` is a list of errors. Validation terms allow applicative-style error accumulation.

Availability:
`logtalk_load(validations(loader))`

Author: Paulo Moura
Version: 1:0:1
Date: 2026-04-22

Compilation flags:
`static, context_switching_calls`

Provides:
type::type/1
type::check/2
Uses:
type

Remarks:

- Type-checking support: Defines a `validation` type for use with the `type` library object.

Inherited public predicates:
(none)

- *Public predicates*
  - *of_valid/2*
  - *of_invalid/2*

      - *of_invalids/2*

  - *Operators*

Public predicates

of_valid/2

Constructs a validation term holding a valid value.

Compilation flags:
`static`

Template:
`of_valid(Value,Validation)`
Mode and number of proofs:
`of_valid(@term,--nonvar)` - `one`

---

of_invalid/2

Constructs a validation term holding a single error.

Compilation flags:
`static`

Template:
`of_invalid(Error,Validation)`
Mode and number of proofs:
`of_invalid(@term,--nonvar)` - `one`

---

of_invalids/2

Constructs a validation term holding a list of errors.

Compilation flags:
`static`

Template:
`of_invalids(Errors,Validation)`
Mode and number of proofs:
`of_invalids(@list,--nonvar)` - `one`

---

from_goal/4

Constructs a validation term holding a value bound by calling the given goal. Otherwise returns a validation term with a single error represented by the `Error` argument.

Compilation flags:
`static`

Template:
`from_goal(Goal,Value,Error,Validation)`
Meta-predicate template:
`from_goal(0,*,*,*)`
Mode and number of proofs:
`from_goal(+callable,--term,@term,--nonvar)` - `one`

---

from_goal/3

Constructs a validation term holding a value bound by calling the given goal. Otherwise returns a validation term with a single error being the goal error or the atom `fail` representing goal failure.

Compilation flags:
`static`

Template:
`from_goal(Goal,Value,Validation)`
Meta-predicate template:
`from_goal(0,*,*)`
Mode and number of proofs:
`from_goal(+callable,--term,--nonvar)` - `one`

---

from_goal/2

Constructs a validation term holding a value bound by calling the given closure. Otherwise returns a validation term with a single error being the closure error or the atom `fail` representing closure failure.

Compilation flags:
`static`

Template:
`from_goal(Closure,Validation)`
Meta-predicate template:
`from_goal(1,*)`
Mode and number of proofs:
`from_goal(+callable,--nonvar)` - `one`

---

from_generator/4

Constructs validation terms with the values generated by calling the given goal. On goal error or failure, returns a validation term with a single error represented by the `Error` argument.

Compilation flags:
`static`

Template:
`from_generator(Goal,Value,Error,Validation)`
Meta-predicate template:
`from_generator(0,*,*,*)`
Mode and number of proofs:
`from_generator(+callable,--term,@term,--nonvar)` - `one_or_more`

---

from_generator/3

Constructs validation terms with the values generated by calling the given goal. On goal error or failure, returns a validation term with, respectively, a single error being the goal error or the atom `fail` representing goal failure.

Compilation flags:
`static`

Template:
`from_generator(Goal,Value,Validation)`
Meta-predicate template:
`from_generator(0,*,*)`
Mode and number of proofs:
`from_generator(+callable,--term,--nonvar)` - `one_or_more`

---

from_generator/2

Constructs validation terms with the values generated by calling the given closure. On closure error or failure, returns a validation term with, respectively, a single error being the closure error or the atom `fail` representing closure failure.

Compilation flags:
`static`

Template:
`from_generator(Closure,Validation)`
Meta-predicate template:
`from_generator(1,*)`
Mode and number of proofs:
`from_generator(+callable,--nonvar)` - `one_or_more`

---

from_optional/3

Converts an optional term to a validation term. Returns a valid term holding the value if the optional term is not empty. Returns an invalid term with the given error otherwise.

Compilation flags:
`static`

Template:
`from_optional(Optional,Error,Validation)`
Mode and number of proofs:
`from_optional(+nonvar,@term,--nonvar)` - `one`

---

from_expected/2

Converts an expected term to a validation term. Returns a valid term holding the value if the expected term holds a value. Returns an invalid term with the expected term error otherwise.

Compilation flags:
`static`

Template:
`from_expected(Expected,Validation)`
Mode and number of proofs:
`from_expected(+nonvar,--nonvar)` - `one`

Protected predicates

Public predicates

is_valid/0

True if the validation term holds a valid value.

Compilation flags:

```
static
```

Mode and number of proofs:

```
is_valid - zero_or_one
```

---

is_invalid/0

True if the validation term holds one or more errors.

Compilation flags:

```
static
```

Mode and number of proofs:

```
is_invalid - zero_or_one
```

---

if_valid/1

Applies a closure when the validation term holds a valid value using the value as argument. Succeeds otherwise.

Compilation flags:
`static`

Template:
`if_valid(Closure)`
Meta-predicate template:
`if_valid(1)`
Mode and number of proofs:
`if_valid(+callable)` - `zero_or_more`

---

if_invalid/1

Applies a closure when the validation term holds errors using the errors list as argument. Succeeds otherwise.

Compilation flags:
`static`

Template:
`if_invalid(Closure)`
Meta-predicate template:
`if_invalid(1)`
Mode and number of proofs:
`if_invalid(+callable)` - `zero_or_more`

---

if_valid_or_else/2

Applies either `ValidClosure` or `InvalidClosure` depending on the validation term holding a value or errors.

Compilation flags:
`static`

Template:
`if_valid_or_else(ValidClosure,InvalidClosure)`
Meta-predicate template:
`if_valid_or_else(1,1)`
Mode and number of proofs:
`if_valid_or_else(+callable,+callable)` - `zero_or_more`

---

valid/1

Returns the value hold by the validation term. Throws an error otherwise.

Compilation flags:
`static`

Template:
`valid(Value)`
Mode and number of proofs:
`valid(--term)` - `one_or_error`

Exceptions:
Validation term holds errors:
`existence_error(valid_value,Validation)`

---

invalid/1

Returns the errors hold by the validation term. Throws an error otherwise.

Compilation flags:
`static`

Template:
`invalid(Errors)`
Mode and number of proofs:
`invalid(--list)` - `one_or_error`

Exceptions:
Validation term holds a valid value:
`existence_error(validation_errors,Validation)`

---

filter/3

When the validation term holds a value and the value satisfies the closure, returns the same validation term. When the validation term holds a value that does not satisfy the closure, returns an invalid term with the given error. When the validation term holds errors, returns the same validation term.

Compilation flags:
`static`

Template:
`filter(Closure,Error,NewValidation)`
Meta-predicate template:
`filter(1,*,*)`

Mode and number of proofs:

```
filter(+callable,@term,--nonvar) - one
```

---

map/2

When the validation term holds a valid value and mapping a closure with the value and the new value as additional arguments succeeds, returns a new valid term. Otherwise returns the same validation term.

Compilation flags:

```
static
```

Template:

```
map(Closure,NewValidation)
```

Meta-predicate template:

```
map(2,*)
```

Mode and number of proofs:

```
map(+callable,--nonvar) - one
```

---

flat_map/2

When the validation term holds a valid value, applies a closure with the value and the new validation term as additional arguments. Returns the new validation term on success. When the validation term holds errors, short-circuits by returning the same validation term without calling the closure. This is the monadic escape hatch for dependent steps; use `zip/3`, `sequence/2`, or `traverse/3` for error accumulation on independent steps.

Compilation flags:

```
static
```

Template:

```
flat_map(Closure,NewValidation)
```

Meta-predicate template:

```
flat_map(2,*)
```

Mode and number of proofs:

```
flat_map(+callable,--nonvar) - one
```

---

map_or_else/3

When the validation term holds a value and mapping a closure with the value and the new value as additional arguments is successful, returns the new value. Otherwise returns the given default value.

Compilation flags:

```
static
```

Template:

```
map_or_else(Closure,Default,Value)
```

Meta-predicate template:

```
map_or_else(2,*,*)
```

Mode and number of proofs:

```
map_or_else(+callable,@term,--term) - one
```

---

map_catching/2

When the validation term holds a value, applies a closure to it. Returns a valid term with the new value if the closure succeeds. Returns an invalid term with the error if the closure throws an error. Returns an invalid term with the atom `fail` as error if the closure fails. When the validation term holds errors, returns the same validation term.

Compilation flags:

```
static
```

Template:

```
map_catching(Closure,NewValidation)
```

Meta-predicate template:

```
map_catching(2,*)
```

Mode and number of proofs:

```
map_catching(+callable,--nonvar) - one
```

---

map_invalid/2

When the validation term holds errors and mapping a closure with the errors list and the new errors list as additional arguments succeeds, returns a new invalid term. Otherwise returns the same validation term.

Compilation flags:

```
static
```

Template:

```
map_invalid(Closure,NewValidation)
```

Meta-predicate template:

```
map_invalid(2,*)
```

Mode and number of proofs:

```
map_invalid(+callable,--nonvar) - one
```

---

map_both/3

When the validation term holds a value and mapping `ValidClosure` with the value is successful, returns a valid term with the new value. When the validation term holds errors and mapping `InvalidClosure` with the errors list is successful, returns an invalid term with the new errors. Otherwise returns the same validation term.

Compilation flags:

```
static
```

Template:

```
map_both(ValidClosure,InvalidClosure,NewValidation)
```

Meta-predicate template:

```
map_both(2,2,*)
```

Mode and number of proofs:

```
map_both(+callable,+callable,--nonvar) - one
```

---

swap/1

Swaps the valid and invalid terms. If the validation term holds a value, returns an invalid term with a singleton list containing that value. If the validation term holds errors, returns a valid term with the errors list.

Compilation flags:

```
static
```

Template:

```
swap(NewValidation)
```

Mode and number of proofs:

```
swap(--nonvar) - one
```

---

or/2

Returns the same validation term if it holds a value. Otherwise calls closure to generate a new validation term. Fails if the validation term holds errors and calling the closure fails or throws an error.

Compilation flags:

```
static
```

Template:

```
or(NewValidation,Closure)
```

Meta-predicate template:

```
or(*,1)
```

Mode and number of proofs:

```
or(--term,@callable) - zero_or_one
```

---

or_else/2

Returns the valid value if present or the default value otherwise.

Compilation flags:
```
static
```

Template:
```
or_else(Value,Default)
```
Mode and number of proofs:
```
or_else(--term,@term) - one
```

---

or_else_get/2

Returns the value hold by the validation term if valid. Otherwise applies a closure to compute the value. Throws an error when the validation term holds errors and a value cannot be computed.

Compilation flags:
```
static
```

Template:
```
or_else_get(Value,Closure)
```
Meta-predicate template:
```
or_else_get(*,1)
```
Mode and number of proofs:
```
or_else_get(--term,+callable) - one_or_error
```

Exceptions:
Validation term holds errors and a value cannot be computed:
```
existence_error(valid_value,Validation)
```

---

or_else_call/2

Returns the value hold by the validation term if valid. Calls a goal deterministically otherwise.

Compilation flags:
```
static
```

Template:
```
or_else_call(Value,Goal)
```
Meta-predicate template:
```
or_else_call(*,0)
```
Mode and number of proofs:
```
or_else_call(--term,+callable) - zero_or_one
```

---

or_else_fail/1

Returns the valid value if present. Fails otherwise.

Compilation flags:
`static`

Template:
`or_else_fail(Value)`
Mode and number of proofs:
`or_else_fail(--term)` - `zero_or_one`

---

or_else_throw/1

Returns the value hold by the validation term if valid. Throws the errors list hold by the validation term as an exception otherwise.

Compilation flags:
`static`

Template:
`or_else_throw(Value)`
Mode and number of proofs:
`or_else_throw(--term)` - `one_or_error`

---

or_else_throw/2

Returns the value hold by the validation term if valid. Throws the given error otherwise, ignoring any errors hold by the validation term.

Compilation flags:
`static`

Template:
`or_else_throw(Value,Error)`
Mode and number of proofs:
`or_else_throw(--term,@nonvar)` - `one_or_error`

---

zip/3

When both this validation and the other validation hold values and applying a closure with both values and the new value as additional arguments is successful, returns a valid term with the new value. When both hold errors, returns an invalid term with all errors accumulated. Otherwise returns the first invalid term.

Compilation flags:

```
static
```

Template:

```
zip(Closure,OtherValidation,NewValidation)
```

Meta-predicate template:

```
zip(3,*,*)
```

Mode and number of proofs:

```
zip(+callable,+nonvar,--nonvar) - one
```

---

flatten/1

Flattens a nested validation term. When the validation term holds a value that is itself a validation term, returns the inner validation term. When the validation term holds a non-validation value, returns the same validation term. When the validation term holds errors, returns the same validation term.

Compilation flags:

```
static
```

Template:

```
flatten(NewValidation)
```

Mode and number of proofs:

```
flatten(--nonvar) - one
```

---

to_optional/1

Converts the validation term to an optional term. Returns a non-empty optional term holding the value if the validation term holds a value. Returns an empty optional term if the validation term holds errors.

Compilation flags:

```
static
```

Template:

```
to_optional(Optional)
```

Mode and number of proofs:

```
to_optional(--nonvar) - one
```

---

to_expected/1

Converts the validation term to an expected term. Returns an expected term holding the value if the validation term holds a value. Returns an expected term with the errors list as the unexpected error otherwise.

Compilation flags:
`static`

Template:
`to_expected(Expected)`
Mode and number of proofs:
`to_expected(--nonvar)` - `one`

Public predicates

increment/0

Increment the counter by 1.

Compilation flags:
`static`

Mode and number of proofs:
`increment` - `one`

---

increase/1

Increments the counter by the specified amount.

Compilation flags:
`static`

Template:
`increase(I)`
Mode and number of proofs:
`increase(+number)` - `one`

---

set/1

Sets the counter to the specified amount.

Compilation flags:
`static`

Template:
`set(N)`
Mode and number of proofs:
`set(+number)` - `one`

---

value/1

Gets the current value of the counter.

Compilation flags:
`static`

Template:
`value(N)`
Mode and number of proofs:
`value(?number)` - `one`

`reset/0`

Resets the counter to zero.

Compilation flags:

rule/4

Clauses for this predicate are automatically generated using term-expansion. The third argument contains the length of Body.

Compilation flags:
`static`

Template:
`rule(Head,Body,Length,Tail)`
Mode and number of proofs:
`rule(?callable,?callable,-,-)` - `zero_or_more`

rule/3

Clauses for this predicate are automatically generated using term-expansion. The third argument denotes the tail of the Body.

Compilation flags:
`static`

Template:
`rule(Head,Body,Tail)`
Mode and number of proofs:
`rule(?callable,?callable,-)` - `zero_or_more`

---

rule/2

Clauses for this predicate are automatically generated using term-expansion.

Compilation flags:
`static`

Template:
`rule(Head,Body)`
Mode and number of proofs:
`rule(?callable,-list(callable))` - `zero_or_more`

---

bench_goal/1

Table of benchmark goals. They are used from shell.lgt to make benchmarking easier.

Compilation flags:

  - *magicise/4*
  - *magic/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

`magicise/4`

Transform (Head :- Body) into a magic clause (NewHead :- NewBody).

Compilation flags:
`static`

Template:

```
magicise(Head,Body,NewHead,NewBody)
```
Mode and number of proofs:
```
magicise(+term,+list,-term,-list) - zero_or_one
```

---

magic/2

Prefix the predicate symbol of Old with *magic*.

Compilation flags:
```
static
```

Template:
```
magic(Old,New)
```
Mode and number of proofs:
```
magic(+callable,-callable) - zero_or_one
```

Protected predicates

Remarks:

(none)

Inherited public predicates:
(none)

- *Public predicates*
  - *parse/2*
  - *generate/2*
  - *validate/1*
  - *validate/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

parse/2

Parses a geometry from the given source. Supported sources are `wkt(file(Path))`, `wkt(stream(Stream))`, `wkt(atom(Atom))`, `wkt(chars(List))`, `wkt(codes(List))`, `wkb(file(Path))`, `wkb(stream(Stream))`, `wkb(bytes(List))`, `wkb(hex(atom(Atom)))`, `wkb(hex(chars(List)))`, and `wkb(hex(codes(List)))`.

Compilation flags:
`static`

Template:
`parse(Source,Geometry)`

Mode and number of proofs:
`parse(++compound,--term)` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid source:
`domain_error(wkt_wkb_source,Source)`
`Source` data does not represent a valid WKT or WKB geometry:
`domain_error(wkt_wkb,Source)`

generate/2

Generates WKT or WKB content using the representation specified in the first argument from a native geometry term. Supported sinks are `wkt(file(Path))`, `wkt(stream(Stream))`, `wkt(atom(Atom))`, `wkt(chars(List))`, `wkt(codes(List))`, `wkb(file(Path))`, `wkb(stream(Stream))`, `wkb(bytes(List))`, `wkb(hex(atom(Atom)))`, `wkb(hex(chars(List)))`, `wkb(hex(codes(List)))`, and the same WKB sink wrappers wrapped as `wkb(Sink, Order)` where `Order` is `little` or `big`.

Compilation flags:

`static`

Template:

`generate(Sink,Geometry)`

Mode and number of proofs:

`generate(+compound,++term)` - `one_or_error`

Exceptions:

`Sink` is a variable:

`instantiation_error`

`Sink` is neither a variable nor a valid sink:

`domain_error(wkt_wkb_sink,Sink)`

`Geometry` is not a valid native geometry term:

`domain_error(wkt_wkb,Geometry)`

`Geometry` is valid but cannot be represented in WKT due to special ordinates:

`domain_error(wkt_wkb_representation,wkt(Geometry))`

---

validate/1

True iff the argument is a valid native WKT/WKB geometry term.

Compilation flags:

`static`

Template:

`validate(Geometry)`

Mode and number of proofs:

`validate(@term)` - `zero_or_one`

---

validate/2

Validates a native geometry term returning a list of reason terms whose final argument is the failing path.

Compilation flags:

`static`

Template:

`validate(Geometry,Errors)`

Mode and number of proofs:

`validate(@term,-list(compound))` - `one_or_error`

Exceptions:

`Geometry` is a variable:

`instantiation_error`

Remarks:

- invalid_geometry_term(Path): The term is not any supported geometry representation.
- invalid_options(Path): The options argument is not a list.
- unknown_option(Option, Path): An option term is not recognized.
- duplicate_option(Name, Path): The same option name occurs more than once.
- invalid_dimensions(Path): A `dimensions/1` option does not use one of the supported values `xy`, `z`, `m`, or `zm`.
- invalid_position(Path): A position is not a list of numeric or supported special IEEE-754 coordinates with the expected dimensionality.
- invalid_position_array(Path): A coordinate array expected to contain positions is not a list.
- mixed_coordinate_dimension(Path): Coordinates in the same geometry do not all have the same dimensionality.
- coordinate_dimension_mismatch(Actual, Expected, Path): The coordinates dimensionality does not match the `dimensions/1` option.
- insufficient_positions(MinimumLength, Path): A coordinate array contains fewer positions than required for the enclosing geometry.
- ring_not_closed(Path): A polygon ring does not repeat its first position as its last position.
- invalid_polygon(Path): A polygon coordinate structure is invalid.
- invalid_multi_polygon(Path): A multi-polygon coordinate structure is invalid.
- invalid_geometry_collection(Path): A geometry collection member is not a list of valid geometry terms.

1.351 wrapper

object

1.351.1 `wrapper`

Adviser tool for porting and wrapping plain Prolog applications.

Availability:
`logtalk_load(wrapper(loader))`

Author: Paulo Moura
Version: 0:12:4
Date: 2026-01-20

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *expanding*
Provides:
logtalk::message_hook/4
logtalk::message_prefix_stream/4
logtalk::message_tokens//2
Uses:
logtalk
os

Remarks:

- `prolog_extensions(Extensions)` option: List of file name extensions used to recognize Prolog source files (default is `['.pl','.pro','.prolog']`).
- `logtalk_extension(Extension)` option: Logtalk file name extension to be used for the generated wrapper files (default is `'.lgt'`).
- `exclude_files(Files)` option: List of Prolog source files names to exclude (default is `[]`).
- `exclude_directories(Directories)` option: List of sub-directory names to exclude (default is `[]`).
- `include_wrapped_files(Boolean)`: Generate `include/1` directives for the wrapped Prolog source files (default is `true`).

Inherited public predicates:

Public predicates

rdirectory/2

Advises the user on missing directives for converting all plain Prolog files in a directory and its sub-directories to Logtalk objects using the specified options.

Compilation flags:

```
static
```

Template:

```
rdirectory(Directory,Options)
```

Mode and number of proofs:

```
rdirectory(+atom,+list(compound)) - one
```

rdirectory/1

Advises the user on missing directives for converting all plain Prolog files in a directory and its sub-directories to Logtalk objects using default options.

Compilation flags:

```
static
```

Template:

```
rdirectory(Directory)
```

Mode and number of proofs:

```
rdirectory(+atom) - one
```

directory/2

Advises the user on missing directives for converting all plain Prolog files in a directory to Logtalk objects using the specified options.

Compilation flags:

```
static
```

Template:

```
directory(Directory,Options)
```

Mode and number of proofs:

```
directory(+atom,+list(compound)) - one
```

directory/1

Advises the user on missing directives for converting all plain Prolog files in a directory to Logtalk objects using default options.

Compilation flags:

```
static
```

Template:

```
directory(Directory)
```

Mode and number of proofs:

```
directory(+atom) - one
```

directories/2

Advises the user on missing directives for converting all Prolog files in a set of directories to Logtalk objects using the specified options.

Compilation flags:
`static`

Template:
`directories(Directories,Options)`
Mode and number of proofs:
`directories(+list(atom),+list(compound))` - `one`

---

directories/1

Advises the user on missing directives for converting all Prolog files in a set of directories to Logtalk objects using default options.

Compilation flags:
`static`

Template:
`directories(Directories)`
Mode and number of proofs:
`directories(+list(atom))` - `one`

---

files/2

Advises the user on missing directives for converting a list of plain Prolog files to Logtalk objects using the specified options.

Compilation flags:
`static`

Template:
`files(Files,Options)`
Mode and number of proofs:
`files(+list(atom),+list(compound))` - `one`

---

files/1

Advises the user on missing directives for converting a list of plain Prolog files to Logtalk objects using default options.

Compilation flags:
```
static
```

Template:
```
files(Files)
```
Mode and number of proofs:
```
files(+list(atom)) - one
```

---

file/2

Advises the user on missing directives for converting a plain Prolog file to Logtalk objects using the specified options.

Compilation flags:
```
static
```

Template:
```
file(File,Options)
```
Mode and number of proofs:
```
file(+atom,+list(compound)) - one
```

---

file/1

Advises the user on missing directives for converting a plain Prolog file to Logtalk objects using default options.

Compilation flags:
```
static
```

Template:
```
file(File)
```
Mode and number of proofs:
```
file(+atom) - one
```

---

save/1

Saves the generated wrapper objects (plus a loader file per directory) for all advised files using the specified options. The wrapper objects are saved to the same directories that contain the wrapped Prolog files.

Compilation flags:
`static`

Template:
`save(Options)`
Mode and number of proofs:
`save(+list(compound))` - `one`

---

save/0

Saves the generated wrapper objects (plus a loader file per directory) for all advised files using default options. The wrapper objects are saved to the same directories that contain the wrapped Prolog files.

Compilation flags:
`static`

Mode and number of proofs:
`save` - `one`

---

default_option/1

Enumerates by backtracking the default options used when generating the wrapper objects.

Compilation flags:
`static`

Template:
`default_option(DefaultOption)`
Mode and number of proofs:
`default_option(?compound)` - `zero_or_more`

---

default_options/1

Returns a list of the default options used when generating the wrapper objects.

Compilation flags:
```
static
```

Template:
```
default_options(DefaultOptions)
```
Mode and number of proofs:
```
default_options(-list(compound)) - one
```

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

merge_options/2

Merges the user options with the default options, returning the list of options used when generating the wrapper objects.

Compilation flags:
```
static
```

Template:
```
merge_options(UserOptions,Options)
```
Mode and number of proofs:
```
merge_options(+list(compound),-list(compound)) - one
```

---

predicate_called_but_not_defined_/2

Table of called object predicates that are not locally defined.

Compilation flags:
```
dynamic
```

Template:
```
predicate_called_but_not_defined_(Object,Predicate)
```
Mode and number of proofs:
```
predicate_called_but_not_defined_(?atom,?predicate_indicator) - zero_or_more
```

---

object_predicate_called_/3

Table of called object predicates.

Compilation flags:
`dynamic`

Template:
`object_predicate_called_(Object,Other,Predicate)`
Mode and number of proofs:
`object_predicate_called_(?atom,?atom,?predicate_indicator)` - `zero_or_more`

---

module_predicate_called_/3

Table of called module predicates.

Compilation flags:
`dynamic`

Template:
`module_predicate_called_(Object,Module,Predicate)`
Mode and number of proofs:
`module_predicate_called_(?atom,?atom,?predicate_indicator)` - `zero_or_more`

---

unknown_predicate_called_/2

Table of predicates called but not defined.

Compilation flags:
`dynamic`

Template:
`unknown_predicate_called_(Object,Predicate)`
Mode and number of proofs:
`unknown_predicate_called_(?atom,?predicate_indicator)` - `zero_or_more`

---

missing_predicate_directive_/3

Table of missing predicate directives.

Compilation flags:
```
dynamic
```

Template:
```
missing_predicate_directive_(Object,Directive,Predicate)
```
Mode and number of proofs:
```
missing_predicate_directive_(?atom,?predicate_indicator,?predicate_indicator) -
zero_or_more
```

---

non_standard_predicate_call_/2

Table of called non-standard predicates.

Compilation flags:
```
dynamic
```

Template:
```
non_standard_predicate_call_(Object,Predicate)
```
Mode and number of proofs:
```
non_standard_predicate_call_(?atom,?predicate_indicator) - zero_or_more
```

---

dynamic_directive_/3

Table of declared dynamic predicates.

Compilation flags:
```
dynamic
```

Template:
```
dynamic_directive_(Object,Line,Predicate)
```
Mode and number of proofs:
```
dynamic_directive_(?atom,?integer,?predicate_indicator) - zero_or_more
```

---

multifile_directive_/3

Table of declared multifile predicates.

Compilation flags:
`dynamic`

Template:
`multifile_directive_(Object,Line,Predicate)`
Mode and number of proofs:
`multifile_directive_(?atom,?integer,?predicate_indicator)` - `zero_or_more`

---

add_directive_before_entity_/2

Table of directives to be added before the entity opening directive.

Compilation flags:
`dynamic`

Template:
`add_directive_before_entity_(Object,Directive)`
Mode and number of proofs:
`add_directive_before_entity_(?atom,?predicate_indicator)` - `zero_or_more`

---

add_directive_/2

Table of directives to be added.

Compilation flags:
`dynamic`

Template:
`add_directive_(Object,Directive)`
Mode and number of proofs:
`add_directive_(?atom,?predicate_indicator)` - `zero_or_more`

---

add_directive_/3

Table of directives to be added to complement existing directives.

Compilation flags:
`dynamic`

Template:
`add_directive_(Object,Directive,NewDirective)`
Mode and number of proofs:
`add_directive_(?atom,?predicate_indicator,?predicate_indicator)` - `zero_or_more`

---

remove_directive_/2

Table of directives to be removed.

Compilation flags:
`dynamic`

Template:
`remove_directive_(Object,Directive)`
Mode and number of proofs:
`remove_directive_(?atom,?predicate_indicator)` - `zero_or_more`

---

file_being_advised_/4

Table of files being advised are respective directories and names (basename without extension).

Compilation flags:
`dynamic`

Template:
`file_being_advised_(File,Path,Directory,Name)`
Mode and number of proofs:
`file_being_advised_(?atom,?atom,?atom,?atom)` - `zero_or_more`

Operators

(none)

1.352 xml_parser

object

1.352.1 `xml`

Bi-directional XML parser.

Availability:
`logtalk_load(xml_parser(loader))`

Author: John Fletcher; adapted to Logtalk by Paulo Moura.
Version: 3:9:0
Date: 2025-10-06

Copyright: Copyright (C) 2001-2005 Binding Time Limited, Copyright (C) 2005-2013 John Fletcher
License: This program is offered free of charge, as unsupported source code. You may use it, copy it, distribute it, modify it or sell it without restriction, but entirely at your own risk.

Compilation flags:
`static, context_switching_calls`

Uses:
list
term

Remarks:

- On-line documentation: https://binding-time.co.uk/index.php/Parsing_XML_with_Prolog
- Compliance: This XML parser supports a subset of XML suitable for XML Data and Worldwide Web applications. It is neither as strict nor as comprehensive as the XML 1.0 Specification mandates.
- Compliance-strictness: It is not as strict, because, while the specification must eliminate ambiguities, not all errors need to be regarded as faults, and some reasonable examples of real XML usage would have to be rejected if they were.
- Compliance-comprehensive: It is not as comprehensive, because, where the XML specification makes provision for more or less complete DTDs to be provided as part of a document, xml.pl actions the local definition of ENTITIES only. Other DTD extensions are treated as commentary.
- Bi-directional conversions: Conversions are not fully symmetrical as weaker XML is accepted than can be generated. Notably, in-bound (Codes -> Document) parsing does not require strictly well-formed XML. If Codes does not represent well-formed XML, Document is instantiated to the term `malformed(<attributes>,<content>)`.

Inherited public predicates:

Public predicates

parse/2

Parses a list of character codes to/from a data structure of the form `xml(<atts>,<content>)`.

Compilation flags:

```
static
```

Template:

```
parse(Codes,Document)
```

Mode and number of proofs:

```
parse(+list(character_code),?nonvar) - zero_or_one
parse(?list(character_code),+nonvar) - zero_or_one
```

---

parse/3

Parses a list of character codes to/from a data structure of the form `xml(<atts>,<content>)` using the given list of options.

Compilation flags:

```
static
```

Template:

```
parse(Options,Codes,Document)
```

Mode and number of proofs:

```
parse(++list(compound),+list(character_code),?nonvar) - zero_or_one
parse(++list(compound),?list(character_code),+nonvar) - zero_or_one
```

Remarks:

- `extended_characters(Boolean)` option: Use the extended character entities for XHTML (default `true`).
- `format(Boolean)` option: For parsing, strip layouts when no character data appears between elements (default `true`). For generating, indent the element content (default `true`).
- `remove_attribute_prefixes(Boolean)` option: Remove namespace prefixes from attributes when it's the same as the prefix of the parent element (default `false`).
- `allow_ampersand(Boolean)` option: Allow unescaped ampersand characters (&) to occur in PCDATA (default `false`).

---

subterm/2

Unifies `Subterm` with a sub-term of `XMLTerm`. Note that `XMLTerm` is a sub-term of itself.

Compilation flags:
`static`

Template:
`subterm(XMLTerm,Subterm)`
Mode and number of proofs:
`subterm(+nonvar,?nonvar)` - `zero_or_one`

---

pp/1

Pretty prints a XML document on the current output stream.

Compilation flags:
`static`

Template:
`pp(XMLDocument)`
Mode and number of proofs:
`pp(+nonvar)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

xml_to_document/3

Translates the list of character codes `XML` into the Prolog term `Document`. `Options` is a list of terms controlling the treatment of layout characters and character entities.

Compilation flags:

```
static
```

Template:

```
xml_to_document(Options,XML,Document)
```

Mode and number of proofs:

```
xml_to_document(+nonvar,+nonvar,?nonvar) - zero_or_one
```

---

empty_map/1

True if `Map` is a null map.

Compilation flags:

```
static
```

Template:

```
empty_map(Map)
```

Mode and number of proofs:

```
empty_map(?nonvar) - zero_or_one
```

---

map_member/3

True if `Map` is a ordered map structure which records the pair `Key-Data`. `Key` must be ground.

Compilation flags:

```
static
```

Template:

```
map_member(Key,Map,Data)
```

Mode and number of proofs:

```
map_member(+nonvar,+nonvar,?nonvar) - zero_or_one
```

---

map_store/4

True if Map0 is an ordered map structure, Key must be ground, and Map1 is identical to Map0 except that the pair Key-Data is recorded by Map1.

Compilation flags:
static

Template:
map_store(Map0,Key,Data,Map1)

Mode and number of proofs:
map_store(+nonvar,+nonvar,+nonvar,?nonvar) - zero_or_one

---

pp_string/1

Prints String onto the current output stream. If String contains only 7-bit chars it is printed in shorthand quoted format, otherwise it is written as a list.

Compilation flags:
static

Template:
pp_string(String)

Mode and number of proofs:
pp_string(+nonvar) - zero_or_one

---

fault/5

Identifies SubTerm as a sub-term of Term which cannot be serialized after Indentation. Message is an atom naming the type of error; Path is a string encoding a list of SubTerm's ancestor elements in the form <tag>{(id)}* where <tag> is the element tag and <id> is the value of any attribute _named_ id.

Compilation flags:
static

Template:
fault(Term,Indentation,SubTerm,Path,Message)

Mode and number of proofs:
fault(+nonvar,+nonvar,?nonvar,?nonvar,?nonvar) - zero_or_one

---

exception/4

Hook to raise an exception to be raised in respect of a fault in the XML Term `Document`.

Compilation flags:

```
static
```

Template:

```
exception(Message,Document,Culprit,Path)
```

Mode and number of proofs:

```
exception(+atom,+nonvar,+nonvar,+nonvar) - one
```

---

document_generation//2

DCG generating Document as a list of character codes. `Format` is true|false defining whether layouts, to provide indentation, should be added between the element content of the resultant "string". Note that formatting is disabled for elements that are interspersed with `pcdata/1` terms, such as XHTML's 'inline' elements. Also, `Format` is over-ridden, for an individual element, by an explicit `'xml:space'="preserve"` attribute.

Compilation flags:

```
static
```

Template:

```
document_generation(Format,Document)
```

Mode and number of proofs:

```
document_generation(+nonvar,+nonvar) - zero_or_one
```

---

pcdata_7bit//1

Represents the ASCII character set in its simplest format, using the character entities `&`, `"`, `<`, and `>` which are common to both XML and HTML. The numeric entity `'` is used in place of `'` because browsers don't recognize it in HTML.

Compilation flags:

```
static
```

Template:

```
pcdata_7bit(Code)
```

Mode and number of proofs:

```
pcdata_7bit(?nonvar) - zero_or_one
```

---

character_data_format/3

Holds when `Format0` and `Format1` are the statuses of XML formatting before and after `Codes` - which may be null.

Compilation flags:
`static`

Template:
`character_data_format(Codes,Format0,Format1)`
Mode and number of proofs:
`character_data_format(+nonvar,+nonvar,?nonvar)` - `zero_or_one`

---

cdata_generation//1

Holds when `Format0` and `Format1` are the statuses of XML formatting before and after `Codes` - which may be null.

Compilation flags:
`static`

Template:
`cdata_generation(Codes)`
Mode and number of proofs:
`cdata_generation(+list)` - `zero_or_one`

Operators

(none)

1.353 yaml

object

1.353.1 yaml

YAML parser and generator.

Availability:
`logtalk_load(yaml(loader))`

Author: Paulo Moura
Version: 1:1:0
Date: 2026-04-17

Compilation flags:
`static, context_switching_calls`

Implements:
`public` *yaml_protocol*
Uses:
list
reader

Remarks:
(none)

Inherited public predicates:
generate/2 *generate_all/2* *parse/2* *parse_all/2*

- *Public predicates*
- *Protected predicates*
- *Private predicates*
- *Operators*

  - *parse_all/2*
  - *generate/2*
  - *generate_all/2*
- *Protected predicates*
- *Private predicates*
- *Operators*

Public predicates

parse/2

Parses YAML content read from the given source (`file(Path)`, `stream(Stream)`, `codes(Codes)`, `chars(Chars)`, or `atom(Atom)`) into a ground term representing the parsed YAML data.

Compilation flags:
`static`

Template:
`parse(Source,YAML)`

Mode and number of proofs:
`parse(++compound,--ground)` - `one_or_error`

Exceptions:
`Source` is a variable:
`instantiation_error`
`Source` is neither a variable nor a valid source:
`domain_error(yaml_source,Source)`

parse_all/2

Parses all YAML documents from the given source (`file(Path)`, `stream(Stream)`, `codes(Codes)`, `chars(Chars)`, or `atom(Atom)`) into a list of ground terms. Documents are separated by `---` markers and optionally terminated by `...` markers.

Compilation flags:

`static`

Template:

`parse_all(Source,YAMLs)`

Mode and number of proofs:

`parse_all(++compound,--list(ground))` - `one_or_error`

Exceptions:

`Source` is a variable:

`instantiation_error`

`Source` is neither a variable nor a valid source:

`domain_error(yaml_source,Source)`

---

generate/2

Generates YAML output using the representation specified in the first argument (`file(Path)`, `stream(Stream)`, `codes(Codes)`, `chars(Chars)`, or `atom(Atom)`) from the ground YAML term in the second argument.

Compilation flags:

`static`

Template:

`generate(Sink,YAML)`

Mode and number of proofs:

`generate(++compound,+ground)` - `one_or_error`

Exceptions:

`Sink` is a variable:

`instantiation_error`

`YAML` is a variable:

`instantiation_error`

`YAML` is not a valid YAML term:

`domain_error(yaml_term,YAML)`

`Sink` cannot be generated:

`domain_error(yaml_sink,Sink)`

---

generate_all/2

Generates YAML output with multiple documents separated by `---` markers using the representation specified in the first argument (`file(Path)`, `stream(Stream)`, `codes(Codes)`, `chars(Chars)`, or `atom(Atom)`) from the list of ground YAML terms in the second argument.

Compilation flags:

`static`

Template:

`generate_all(Sink,YAMLs)`

Mode and number of proofs:

`generate_all(++compound,+list(ground))` - `one_or_error`

Exceptions:

`Sink` is a variable:

`instantiation_error`

`YAMLs` is a variable:

`instantiation_error`

`YAMLs` is not a list:

`type_error(list,YAMLs)`

An element of `YAMLs` is not a valid YAML term:

`domain_error(yaml_term,Term)`

`Sink` cannot be generated:

`domain_error(yaml_sink,Sink)`

Protected predicates

(none)

Private predicates

(none)

Operators

(none)

1.354 z_score_anomaly_detector

object

1.354.1 z_score_anomaly_detector

Statistical Z-score anomaly detector for continuous datasets. Learns per-attribute population mean and standard deviation from baseline training examples selected from a dataset object implementing the `anomaly_dataset_protocol` protocol and returns a detector term that can be used for scoring, prediction, and export.

Availability:

```
logtalk_load(z_score_anomaly_detector(loader))
```

Author: Paulo Moura
Version: 1:0:0
Date: 2026-05-06

Compilation flags:

```
static, context_switching_calls
```

Imports:

`public` *anomaly_detector_common*

Uses:

format

Public predicates

zip/2

Adds a zipper to a compound term holding a sequence of elements. Fails if the sequence is empty.

Compilation flags:

```
static
```

Template:

```
zip(Sequence,Zipper)
```

Mode and number of proofs:

```
zip(+sequence,--zipper) - zero_or_one
```

zip/3

Adds a zipper to a compound term holding a sequence of elements. Also returns the first element. Fails if the sequence is empty.

Compilation flags:
`static`

Template:
`zip(Sequence,Zipper,First)`
Mode and number of proofs:
`zip(+sequence,--zipper,--term)` - `zero_or_one`

---

unzip/2

Removes a zipper from a sequence.

Compilation flags:
`static`

Template:
`unzip(Zipper,Sequence)`
Mode and number of proofs:
`unzip(@zipper,--sequence)` - `one`

---

current/2

Current element.

Compilation flags:
`static`

Template:
`current(Zipper,Current)`
Mode and number of proofs:
`current(+zipper,?term)` - `zero_or_one`

---

next/2

Moves to the next element. Fails if already at the last elements.

Compilation flags:
`static`

Template:
`next(Zipper,NewZipper)`
Mode and number of proofs:
`next(+zipper,--zipper)` - `zero_or_one`

---

next/3

Moves to and returns the next element. Fails if already at the last elements.

Compilation flags:
`static`

Template:
`next(Zipper,NewZipper,Next)`
Mode and number of proofs:
`next(+zipper,--zipper,-term)` - `zero_or_one`

---

previous/2

Moves to the previous element. Fails if already at the first elements.

Compilation flags:
`static`

Template:
`previous(Zipper,NewZipper)`
Mode and number of proofs:
`previous(+zipper,--zipper)` - `zero_or_one`

---

previous/3

Moves to and returns the previous element. Fails if already at the first element.

Compilation flags:
`static`

Template:
`previous(Zipper,NewZipper,Previous)`
Mode and number of proofs:
`previous(+zipper,--zipper,-term)` - `zero_or_one`

---

rewind/2

Rewinds the zipper so that the first element becomes the current element.

Compilation flags:
`static`

Template:
`rewind(Zipper,NewZipper)`
Mode and number of proofs:
`rewind(+zipper,--zipper)` - `one`

---

rewind/3

Rewinds the zipper so that the first element becomes the current element. Also returns the first element.

Compilation flags:
`static`

Template:
`rewind(Zipper,NewZipper,First)`
Mode and number of proofs:
`rewind(+zipper,--zipper,?term)` - `zero_or_one`

---

forward/2

Forward the zipper so that the last element becomes the current element.

Compilation flags:
`static`

Template:
`forward(Zipper,NewZipper)`
Mode and number of proofs:
`forward(+zipper,--zipper)` - `one`

---

forward/3

Forward the zipper so that the last element becomes the current element. Also returns the last element.

Compilation flags:
`static`

Template:
`forward(Zipper,NewZipper,Last)`
Mode and number of proofs:
`forward(+zipper,--zipper,?term)` - `zero_or_one`

---

apply/2

Applies a closure to the current element.

Compilation flags:
`static`

Template:
`apply(Closure,Zipper)`
Meta-predicate template:
`apply(1,*)`
Mode and number of proofs:
`apply(+callable,+zipper)` - `zero_or_more`

---

insert_before/3

Inserts an element before the current one.

Compilation flags:
`static`

Template:
`insert_before(Zipper,Element,NewZipper)`
Mode and number of proofs:
`insert_before(+zipper,?term,--zipper)` - `zero_or_one`

---

insert_after/3

Inserts an element after the current one.

Compilation flags:
`static`

Template:
`insert_after(Zipper,Element,NewZipper)`
Mode and number of proofs:
`insert_after(+zipper,?term,--zipper)` - `zero_or_one`

---

replace/3

Replaces the current element with a new element.

Compilation flags:
`static`

Template:
`replace(Zipper,NewCurrent,NewZipper)`
Mode and number of proofs:
`replace(+zipper,?term,--zipper)` - `one`

---

delete_and_previous/2

Deletes the current element and moves to the previous element. Fails if no previous element exists.

Compilation flags:
`static`

Template:
`delete_and_previous(Zipper,NewZipper)`
Mode and number of proofs:
`delete_and_previous(+zipper,--zipper)` - `zero_or_one`

---

delete_and_next/2

Deletes the current element and moves to the next element. Fails if no next element exists.

Compilation flags:
`static`

Template:
`delete_and_next(Zipper,NewZipper)`
Mode and number of proofs:
`delete_and_next(+zipper,--zipper)` - `zero_or_one`

---

delete_and_unzip/2

Deletes the current element and removes the zipper returning the resulting sequence.

Compilation flags:
`static`

Template:
`delete_and_unzip(Zipper,Sequence)`
Mode and number of proofs:
`delete_and_unzip(+zipper,--sequence)` - `one`

---

delete_all_before/2

Deletes all elements before the current element.

Compilation flags:
`static`

Template:
`delete_all_before(Zipper,NewZipper)`
Mode and number of proofs:
`delete_all_before(+zipper,--zipper) - one`

---

delete_all_before_and_unzip/2

Deletes all elements before the current element and removes the zipper returning the resulting sequence.

Compilation flags:
`static`

Template:
`delete_all_before_and_unzip(Zipper,NewZipper)`
Mode and number of proofs:
`delete_all_before_and_unzip(+zipper,--sequence) - one`

---

delete_all_after/2

Deletes all elements after the current element.

Compilation flags:
`static`

Template:
`delete_all_after(Zipper,NewZipper)`
Mode and number of proofs:
`delete_all_after(+zipper,--zipper) - one`

---

delete_all_after_and_unzip/2

Deletes all elements after the current element and removes the zipper returning the resulting sequence.

Compilation flags:
```
static
```

Template:
```
delete_all_after_and_unzip(Zipper,NewZipper)
```
Mode and number of proofs:
```
delete_all_after_and_unzip(+zipper,--sequence) - one
```

Public predicates

zip_at_index/4

Adds a zipper to a list opened at the given index and also returns the element at the index. Fails if the list is empty or the index (starting at 1) does not exist.

Compilation flags:

`static`

Template:

`zip_at_index(Index,List,Zipper,Element)`

Mode and number of proofs:

`zip_at_index(+natural,+list,--zipper,--term)` - `zero_or_one`

Protected predicates

(no local declarations; see entity ancestors if any)

Private predicates

(no local declarations; see entity ancestors if any)

Operators

(none)

CHAPTER
TWO

DIRECTORIES

To load an entity, always load the library that includes it using the goal `logtalk_load(library_name(loader))` instead of using its path. The library loader file ensures that all the required dependencies are also loaded and that any required flags are used. The loading goal can be found in the entity documentation.

CHAPTER
THREE

ENTITIES

To load an entity, always load the library that includes it using the goal `logtalk_load(library_name(loader))` instead of loading just the entity. The library loader file ensures that all the required dependencies are also loaded and that any required flags are used. The loading goal can be found in the entity documentation.

CHAPTER
FOUR

PREDICATES

This index lists all entities *declaring* a given predicate. To load an entity providing the predicate that you want to call, always load the library that includes it using the goal `logtalk_load(library_name(loader))` instead of loading just the entity. The library loader file ensures that all the required dependencies are also loaded and that any required flags are used. The loading goal can be found in the entity documentation.
